DUTY FREE.

Nicotine Soap.

AN Unrivalled INSECTICIDE for the use of Plant Cultivators, being an effectual ERADICATOR of SCALE, THIRPS, GREEN FLY, MEALY BUG, and ALL PARASITES affecting PLANTS, WITHOUT INJURY TO FOLIAGE. It has now undergone a thorough test by some of the most practical men in Horticulture, and it is proved, beyond all doubt, that no Insecticide will bear comparison with it for its deadly effect on Insects, combined with perfect safety to the Plants themselves.

Some hundreds of Testimonials lately received from men of considerable experience throughout the Kingdom.

Sold in Jars, 1s. 6d. and 3s.; in Tins, 15s. 6d.; and in Drums, 28 lb., 25s.; 56 lb., 50s.; 112 lb., 95s.

Full directions for use upon each Package.

For Green and Black Fly, American Blight, Camellia Scale, Red Spider, Mealy Bug, Brown and White Scale, Worms, Wood Lice, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL.
15, PRINCES STREET, EDINBURGH, July 15, 1887.—"Dear Sirs, I have thoroughly tested a sample of a new Insecticide which you were so good to send me. At the rate of 1 oz. to a gallon of water at a temperature of 95° F. it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 120°, seals the fate of Scale of all sorts in a few seconds; while 3 oz. to a gallon at same temperature effectually dissolves Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through common syringe, or garden engine, a much severer test of efficiency than when applied by hand-washing or spray.—I remain, dear sirs, yours truly. (Signed) A. MACKENZIE, of Messrs. Methven & Sons.

Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888.—"GENTLEMEN—I have given your Insecticide, 'Picrena,' a good trial in competition with many others. I am pleased to say that I have found it to be more effectual in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale. (Signed) B. S. WILLIAMS."

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins (1 and 2 gallons), 10s. 6d. and 20s. each; in quantities of 5 gallons and upwards, 5s. per gallon.

Prepared only by **DUNCAN, FLOCKHART & CO., Chemists to the Queen, Edinburgh.**

May be had from B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from **WILLIAM EDWARDS AND SON, 157, Queen Victoria Street, London.**

SAVES MORE THAN TWICE ITS COST IN LABOUR. NO SMELL. One application will keep the Walks and Drives clear of all weeds. Sold Proprietors and Manufacturers. Highly commended by the Judges at the Alexandra Palace Race Show, 1889, after 15 Months' Trial. Awarded a Certificate of Merit by the Scottish Horticultural Association, 1889. "This is the best and most effective with regard to its efficiency." "I am satisfied with your composition and its price, that we have used it absolutely, and have every intention of recommending it." Mr. R. IRWIN LYNCH, Curator, Botanic Gardens, Cambridge, says:—"There can be no question as to the superiority of this." Prices:—In 1 and 2-gal. tins, 2s. per gal. (tins included); in 5-gal. drums, 1s. 6d. per gal.; 10 and 15-gal. Drums, 1s. 4d. per gal. Special quotation for larger quantities. Carriage paid on 10 gal. and upwards.
To be had of ALL NURSERYMEN and SEEDSMEN. To prevent disappointment, insist upon having the "ACME."
THE AGRICULTURAL CHEMICAL COMPANY, Tunbridge, Kent; & Carlton St., Bolton, Lancashire. Agents in Ireland—W. DRUMMOND & SONS, 78, Dawson St., Dublin; WALTER CARSON & SONS, 21, Bachelor's Walk, Dublin; ALEX. BIRKBECK & SONS, 58, Royal Avenue, Belfast; W. MCKENZIE & SONS, Limited, Agricultural House, Camden Quay, Cork.

NATIVE GUANO: BEST and CHEAPEST MANURE for Garden use, NATIVE GUANO. Price £3 10s. per ton, in bags. Lots under 10 cwt., 4s. per cwt. 1 cwt. sample bag sent, carriage paid, to any station in England on receipt of P.O. for 3s.

Extracts from Thirteenth Annual Collection of Reports:—"I found your Manure gave very satisfactory results."
NATIVE GUANO for POTATOS, VEGETABLES, FRUIT, &c.—C. FIDLER, Reading, used it for Potatos, and says:—"I found your Manure gave very satisfactory results."
C. J. WAITE, Gr. to Col. the Hon. W. P. Talbot, says:—"I can strongly recommend your Native Guano as a first rate Manure for any fruits or kitchen garden crops, also grass, in 5-6 years during which I have freely used it. I have gained over 500 prizes."

NATIVE GUANO for ROSES, TOMATOS, &c.—W. G. BAILEY, Nurseries, Beady, used it for Roses, Tomatos, and Cucumbers, and says:—"I find it a good and cheap article."

A. F. BARROW, Royal Horticultural Society, says:—"Without doubt a very valuable Manure, and easy of application."
Orders to the NATIVE GUANO CO., Limited, 29, New Bridge Street, Blackfriars, London, E.C., where Pamphlets of Testimonials, &c., may be obtained. Agents wanted.

BENTLEY'S INSECTICIDE.

Mr. G. WYTHES, *Syon House, writes:*—"Bentley's Insecticide is a great saving in comparison to others. We use it largely, and it never fails to thoroughly eradicate all insect pests." Botts, 2s. 1d., 4s. 1d., postage paid, Half Gallons, 5s.; One Gallon, 10s.
To be had of the Trade, or the Sole Manufacturer, **JOSEPH BENTLEY, Chemical Works, Barrow-on-Umber, HULL.**

Great Reduction in Price of LETHORION (VAPOUR CONE).

Nothing can surpass this method for the total destruction of Insect Pests in Greenhouses. It CANNOT fail where the houses are secure. No possible injury to the most delicate plant.

AGENTS WANTED—AGENTS WANTED.

SANKEY'S GARDEN POTS

Are used by the leading Horticulturists and largest Nurseries in the World, and acknowledged by all to be the lightest, strongest, best colored, most perfect shaped and finished pots ever manufactured.

MARKET POTS,

or Long Tons, are largely used by Market Growers—they are made a greater depth, wider at bottom, and save half an inch in width at top over ordinary pots. Have no ribs.

VINE POTS

Are used by the leading Vine Growers throughout the kingdom, and pronounced unequalled for Vine Culture.

CHRYSANTHEMUM POTS.

Considerably deeper than ordinary—very broad at bottom, almost upright in shape; do not flow over when outside, like narrow bottomed pots; give maximum amount of room for nutriment of roots of plants.

CLEMATIS POTS.

OPINION. "Your pots are light and strong, first-class colour, shape, and finish. The 'Clematis' Pots' give unqualified satisfaction to ourselves and customers." Messrs. Wood & Ingram, Huntingdon.

ROSE POTS.

OPINION. "We beg to say that we are highly satisfied with your Garden Pots; they are well made, light, yet strong, and we like them better than any others we have ever used." Messrs. Richard Smith & Co., Nurseries, Worcester.

"The Flower Pots you have largely supplied us with are light, strong, and well made, and in every respect highly satisfactory." Messrs. Dicksons Ltd., Chester.

"For nearly thirty years I have been using your Garden Pots, and still find them the best and cheapest." Mr. William Bull, Chelsea.

"We have always found your Pots highly satisfactory. Great improvements last few years in them." Messrs. Pearson & Sons, Chiswell Nurseries, Notts.
Samples and Prices free. Cartage and breakage free on £10. Half cartage on £5. Specially Dried Fans and Pots.

BULWELL POTTERIES, NOTTINGHAM.

MESSINGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus.
Just issued, will be found the most complete, practical, and reliable guide to all about building, altering, or heat greenhouses. Illustrations of every description of Glass-houses, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot Water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, and contains many practical hints on the subject of which it treats, the result of many years' experience. Price 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country, an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by and use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices who defy competition. Surveys made and gentlemen wanted on in any part of the country. Plans and Estimates free on application.

MESSINGER & COMPANY, LOUGHBOROUGH.

ANTHRACITE COAL.

The Best and Cheapest Fuel for Greenhouse Boilers, Stoves, and Heating Apparatus.

HENDREFFORGAN ANTHRACITE SMOKELESS COAL. THE UNITED ANTHRACITE COLLIERIES (Limited) supply their Nut or Colliery Coal; the Nuts being about the size of a Walnut, and the Colliery about the size of a man's fist, delivered in truckloads to any railway station. This coal is ABSOLUTELY SMOKELESS, and it requires much less attention than any other description of fuel, burning for twelve hours at least without any supervision, and giving from five to ten degrees more heat than coke. Quotations can be had on application to the Company's Office, 23, Lime Street, London, E.C.

Quotations for London delivery can be obtained for the Northern, Western, and South-Western districts, from Messrs. G. E. CARTER and SON, Coal Exchange, E.C.; and for the South-Eastern district, from Messrs. W. DOWELL and CO., Coal Merchants, Greenwich, S.E.

SAMUEL SHEPPERSON,

Florist and Seedsman,
 PROSPECT HOUSE, BELPER, DERBYSHIRE.

Desires to inform the readers of this Paper that he is prepared to execute Orders for the following Plants, all of which are of the very finest strains that money can buy. They have all been grown on the Derbyshire hills, and are hardy and strong. Carriage Free. Cash with order. Descriptive LIST, Ad. free to customers.

CHRYSANTHEMUMS.—Special culture, not a collection of old-fashioned sorts, but the cream only of the best English, French, American, and Japanese raisers, including the very latest novelties. Good well-rooted plants, 12 for 2s. 6d., 25 for 5s. 6d., warranted true to name; 12 varieties, all new of 1885 and 1889, for 4s.

PANSIES.—A great Specialty. Five Silver Cups, and other Prizes. The cream only of the most noted raisers, the latest new sorts, and the winners at all the great shows. Good plants, currently named, Show or Fancy, 12 for 2s. 6d., 25 for 5s. 6d., free. Also Seed, 1s. and 2s. 6d. per pkt.

PILOX, special culture, the cream only from Down, Turf & Sons, Kelsay, Warr, and other first-class growers. Six fine varieties for 2s., 12 for 3s., true to name. Strong stools, to bloom well.

CARNATIONS, PICOTEES, and CLOVES.—Strong layers, to bloom well, finest named varieties, 12 distinct colours for 1s., 25 for 5s. 6d. Also Seed, 1s. and 2s. 6d. per packet.

CANTERBURY BELLS.—Grand new colours and new forms, double and single, telescopic, cup and saucer, and other varieties, 12 plants, to bloom well, 1s. 6d., 25, 2s. 6d. Also Seed, 6d. and 1s. per packet.

THE BEAUTIFUL PURE WHITE and PINK MALVA MOSCHATA, one of the best hardy border plants in cultivation. Strong 2-year old plants, 12 for 1s. 6d.; 25 for 2s. 6d.; also Seed, 6d. and 1s. per packet.

HOLLYHOCKS.—Warranted all fine double flowers. Chater's select strain. Strong year-old plants to bloom well, 12 varieties, 3s.; 25 varieties, 2s.

POLYANTHUS and PRIMROSE.—Hybrids, splendid mixed colours, best strain grown, 12 for 1s. 6d., 25 for 2s. 6d.; 100, 9s., all good blooming plants. Also Seed, 6d. and 1s. per packet.

HYACINTHUS CANTICANS.—A really fine and specially hardy w. 2-colored border plant. Six flowering bulbs for 1s. 6d., 12 for 2s. 6d.

DELPHINIUMS.—In all the colours found in this deservedly popular class of border plant. Strong plants to bloom well, 6 for 1s. 6d., 12 for 2s. 6d., free. Also Seed, 6d. and 1s. per packet.

FOXGLOVES.—Gloxinia flowered. Bean's grand new large spotted, and pure white varieties, 12 for 1s. 6d.; 25, 2s. 6d. Also Seed, 6d. and 1s. per packet.

SWEETLY-SCENTED PURE SNOW WHITE PINKS, quite hardy, 12 for 1s. 6d., 24 for 2s. 6d.

CARNATIONS, PICOTEES, and CLOVES.—Strong year-old plants, from finest varieties only, including many new sorts; 12 beautiful varieties for 2s. 6d., 6 for 1s. 6d., 100, 15s.

PANSY PANSLIES. Unnamed, 12 for 1s. 6d.; 25 for 2s. 6d., 100 for 10s. All different and first-class sorts.

THE NEW DOUBLE SCARLET GEM, hardly from blooming, strong two-year-old plants, 12 for 1s. 6d., 25 for 2s. 6d., also Seed, 6d. and 1s. per packet.

AURICULA (Alpines). A splendid collection. Strong plants to bloom well, most beautiful colours and sweetly scented, 12 for 2s.; 25, for 5s. 6d. Seed, 6d. and 1s. per packet. Also AURICULA, the real old Irish Duddy Miller, sweetly scented, 3 for 1s. 6d.; 6 for 2s. 6d.

THREE WHITE GEMS, CAMPANULA PERSICIFOLIA, Single White, Double White, and CORONATA, all quite hardy and unsuited for cut flowers, 3 of each for 2s.

THREE WHITE HARDY BEAUTIES—GNAPHALUM LANATUM, everlasting, last for years after being cut. IBERIS CORDELLA, evergreen, and pure white flowers; AQUILEGIA ALBA, the largest pure white, 1 each for 1s.; 2 each for 2s. 6d.

TOMATOES.—The best sorts in cultivation. 1 See Chiswick Great Tomatoes. 1s. 6d. per dozen.

TWO GEMS, PRIMAULA CORTESIOIDES and PRIMAULA CASIMIREANA, hardening papers; they would be difficult to find more beautiful plants for the Borders, or for outside than these, 2 each, 1s. 6d.; 4 each, 2s. 6d. Also Primula Salsburghiana, the Queen of Primulas, George's International Prize, 3 distinct varieties named for 2s.

12 HARDY PERENNIAL BORDER PLANTS (named), distinct and useful for decoration and cutting purposes, for 2s.

12 VARIETIES OF SHOWY, Free-flowering, and other WINDOW PLANTS (named), for 2s.

NEW STRAWBERRY, NOBLE (Laxton's).—This is, without doubt, the earliest, handsomest, largest, and best Strawberry in cultivation; 12 fruiting plants for 1s. 6d., 25 for 2s. 6d., 100 for 7s. 6d.

STRAWBERRY PLANTS.—Selected Crownes for fruiting this year. Dutch Queens, Pauline, Sabreur, Vicomtesse H. de Thury, Duke of Edinburgh, King of the Earlies, Sir Harry, Dr. Hogg, President, The Captain, and other new and extra sorts, 12 for 1s. 6d.

S. SHEPPERSON, Florist, BELPER.

EFFECT OF FOG ON PLANTS.
 MY experience of London fog in its effects on vegetation in general, and under glass more particularly, dates back to the autumn of 1870, when I came first to reside within the fog radius. Coming from the country, I followed in my practice the same lines in many respects that were suitable there, and hoped for equally good results, but I was soon taught a lesson that was not forgotten. I had taken especial pains with Strawberries in pots for forcing during the latter part of the summer of that year, and was rewarded by obtaining as good a lot of plants as could be desired. I closed a vinery in the early part of November, and filled the shelves with Strawberry plants, never dreaming of failure. The first intimation I received was a week or two afterwards when visited by Mr. G. Baker, now the gardener at Mombland Hall, who asked me what I thought I was going to get from my Strawberry plants, and added that I might as well spare myself any further trouble, and throw my plants away at once. I soon found out my mistake, for every pot failed to show bloom. I placed another batch in a vinery started on January 1, and these were all that could be desired, fine fruit being ripened by the end of March. Since then I have tried more than once, chiefly with my plants in 48-pots, the former having been in 32's, but the result was similar. Now I never attempt to start Strawberry forcing before the beginning of the new year, and even then it may be considered a very risky proceeding for at least three weeks longer, and I doubt if there is any gain at all commensurate with the labour expended upon the preparation of the plants, in starting them before February 1. I have tried the best known early kinds, but the result is the same in nearly every instance: Keen's Seedling and Vicomtesse Hericart de Thury being the two best.

The great difficulty that I, in common with other gardeners, have experienced in Strawberry forcing is in getting the spikes to start away freely, the plants often opening only a few flowers close to the crown, and these in most cases fail to set. I have tried a greater degree of heat than is usual, with little better success in the case of the latter kind. The foliage will often get too far in advance of the spikes, causing the latter to be weaker still. Should a few days of foggy weather ensue just as they are in flower, the risk of not setting the fruit is further increased.

The early forcing of Vines is also a difficult matter, and generally speaking a very tedious procedure, especially if these have been weakened by previous hard forcing. From the time of starting to the time of cutting the first ripe fruit, at least a fortnight longer must be allowed about London than in the country. The extremely small amount of sunshine in the winter, the overcast and gloomy sky through which the sun seldom penetrates, causes weakly growth and thin foliage, that lack the substance and vigour so essential to success. Should a few days of foggy weather ensue just as the bunches are beginning to grow freely, and a few weeks before coming into flower, many of them will cease to grow, gradually turning yellow, and dying off. I have experienced this evil to a serious extent, and where previously I had a good show of bunches with a margin of superfluous ones, the number became so much reduced as not to leave a fair crop. This, I know, happens in more favourable localities if root action is weakly, but worse will be the crop of Grapes, if this happen in the smoke radius. The late Mr. Woodbridge told me that at Syon House, even with only moderately early forcing, his Vines were not trusted to yield a good return after being planted more than ten years, an experience agreeing with mine. After that time the sooner young canes are planted the better. I am much in favour of employing pot Vines for the earliest and the succeeding crop of Grapes, rather than at an early date force Vines planted for a permanency. Should a turn of fog set in just as Peaches and Nectarines are expanding their blossoms, these will be considerably weakened, and if, when in full bloom, the petals will drop prematurely, the result in both instances being a considerable diminution in the crop. The wood buds in the case of these fruits will also, if thinned out very early, get too far in advance of the fruit, and thus exhaust them and prevent them swelling off, as they should do in their earlier stages, in a kind manner. The thinning of the blossoms before expanding may do very well in the country districts, but we are only too glad to retain as many as we can through our critical periods. Thorough ripening of the wood, essential under all circumstances, is absolutely so under such conditions, and to bring about this, I may say I am no believer in removing the lights after the fruit is picked; but prefer, rather, to rely upon a greater amount of heat thus gained to effect the purpose in view.

The early forcing of Melons and Cucumbers has also to be proceeded with in a cautious manner, and if the first lot of plants should fail, it must not be wondered at. I have found, in both cases, that the foliage, by reason of its weak state, is very liable to be scalded by sunshine. To prevent this, light shading has to be resorted to, when under more favourable skies it would be looked upon as an unwise practice. The cultivation of the Tomato through the winter months within the London area is almost an impossibility, the plants soon losing their foliage; Mr. Barron, at Chiswick, has had similar experience in the culture of this fruit in the winter.

Turning from fruits to plants, no better results can be recorded, though the effects are not, in many cases, of so permanent a character. From the month of October onwards to the end of February, is the time when the most destruction occurs to the flowers. Many of the Orchids which flower during that season of the year fall a prey to the fog; the

Calanthes in particular, and Phalaenopsis in flower or bud, the latter falling off in a few days. The Cypripediums are not so much affected; but Vandas are discoloured and rendered unsightly. Amongst stove plants, the Clerodendrons quickly suffer, especially C. fallax, the flowers and buds of which will fall in a wholesale fashion; Gardenias will turn yellow as soon as they expand, and Ixoras shed their flowers profusely. If Bouvardias are grown at all on the cool side or in too moist an atmosphere scarcely a flower will be left. Of greenhouse plants, the flowers of the Ericas, such as E. hymalis, lose their otherwise bright colour, and the Epacris look afterwards as if they had been scalded. Chrysanthemums do not last nearly so long as they should do, nor do they open anything like so well or display that intensity of colour that is peculiar to each kind.

Camellias grow well, set their buds freely, and in some instances shed them almost as completely. I have taken every possible pains to prevent it, but thus far have not succeeded to my satisfaction. C. alba-plena, C. Lady Hume's Blush, and C. imbricata suffer the most, whilst C. Countess of Orkney rarely loses a bud, nor does C. Chandleri elegans. Pelargoniums of the single zonal section, which have been prepared for winter flowering, are not to be relied upon during the prevalence of fogs, casting of the petals being then common. The double varieties are those best suited for the atmosphere of London. Tree Carnations, which in the country can be grown with ease, require the greatest care, even to attain to only moderate results. The double Primulas are another instance of plants, which unless a house is specially devoted to them, give but very poor return. Violets under glass, in pots or in frame, give scarcely any blooms. I have tried different methods, but can never succeed with any. After a severe fog the plants lose nearly all their foliage; I can grow them very well up to the time the fogs arrive. The washing of the glass after foggy weather is indispensable, and it does not do to rely upon a shower of rain to do this, as the matter deposited adheres much too tightly for that. The better plan is to tie an ordinary hair broom upon a longer handle, and then after syringing the glass, but taking care not to force water through the laps, loosen the deposit with the broom, and give another syringing which will send it into the gutters. I think that a slight increase in the temperatures at such times by fire-heat helps to prevent the fog from penetrating into the houses so much as it otherwise would do. The fogs vary greatly in humidity; those that are the most destructive are, in my opinion, the dense yellow ones which do not embody so much moisture, but give a choking sensation in the throat when breathed. It is no uncommon thing for work of importance to have to be suspended when these fogs are at their worst. In the middle of the day I once tried to read the print of an ordinary newspaper, but could not do so with certainty. Sometimes it is so dark that the watering of plants could not be proceeded with in a proper manner. The fogs are generally worse after a few days' frost, and when the thermometer is rising. Fortunately for us we have been very free from any bad fogs since Christmas last, so that forcing in all departments has not been such a tax upon us as it generally is at this season of the year. Outside results I hope to touch upon shortly. J. Hudson, Gunnersbury.

JAPANESE MAPLES AS DECORATIVE PLANTS.

—These elegant plants are much used by Messrs. HOOPER & Co. for the decoration of apartments, that part of their business known to the trade as "furnishing." A household of them at their Pineapple Nursery exhibits great variety and beauty of leaf. The elegantly cut-leaved form, known as Acer Gordonii, is certainly one of the best, and the varieties of A. polymorphum have elegantly cut and variously tinted foliage. Mr. WILLINGHAM, the able manager here, says that, although hardy, the protection of glass and a little gentle heat in spring is necessary, as the foliage is thus produced and the plants made fit for use earlier than if left unprotected.

NEW OR NOTEWORTHY PLANTS.

EUCHARIS BAKERIANA, N. E. Br. (n. sp.).

IN the number of its species Eucharis is becoming quite a respectable genus. Here is another new species (fig. 61), of which a specimen was recently sent to Kew by F. Sander & Co., of St. Albans, the plant having been imported by that firm from Columbia. It is a distinct and well-marked plant, differing from the other species in its corona, and in having the tube of the flower of nearly equal diameter almost up to the top, being very little dilated at the throat, although, according to information kindly furnished by Mr. Weathers, one flower had its tube "constricted or attenuated at its base." The flowers are of good size, as may be seen from the accompanying woodcut, and it appears to me likely to prove nearly as good a decorative plant as E. amazonia, provided it can be induced to flower as freely. It is dedicated to my respected friend and colleague, Mr. J. G. Baker, the well-known authority on bulbous plants.

The bulbs are ovoid, clothed with smooth brown scales. Leaves four or five to a bulb, $1\frac{1}{2}$ to 2 feet long, including the petiole; the blade varies from ovate-elliptic to elliptic, acute, and is from 4 to 6 inches broad, and of a bright dark green colour. The scape is from 9 to 16 inches long, slightly compressed, and covered with a glaucous bloom. Umbels four to five flowered; bracts two, broadly lanceolate, acute, $\frac{1}{2}$ to 2 inches long. Pedicels $\frac{1}{2}$ to 2 inches long, green. Perianth-tube $\frac{1}{2}$ inch long, white, rather abruptly curved at the base, cylindrical almost to the top, with the throat about $\frac{1}{2}$ to $\frac{3}{4}$ of an inch in diameter. The expanded flower about $2\frac{1}{2}$ inches in diameter, pure white, or with six pale yellow stripes on the corona; the segments oblong-lanceolate, acute, $1\frac{1}{2}$ inch long, $\frac{3}{4}$ to $\frac{1}{2}$ of an inch broad; corona funnel-shaped, $\frac{1}{2}$ to $\frac{3}{4}$ of an inch deep, and $\frac{1}{2}$ to $\frac{3}{4}$ of an inch in diameter, with two obtuse, oblong teeth between each pair of filaments; below these teeth the corona is somewhat plicately folded. Filaments short, about $\frac{1}{2}$ of an inch long, narrowed upwards, anthers linear, versatile. Ovary about $\frac{1}{2}$ of an inch long and broad, trigonous, green; ovules few in each cell, superposed. N. E. Brown, *Herbarium, Kew.*

MASDEVALLIA LOWII, Rolfe, n. sp.*

This is a new and very pretty species, belonging to the section Saccoballata, and with much of the general habit of M. Chimera, but totally distinct in its characters. It was introduced from the Cauca by Messrs. Hooper Low & Co., and flowered during last autumn. Its nearest ally is M. trinema, Rehb. f. (*Flora*, 1886, p. 558), described from dried specimens, and which I am not aware has ever been in cultivation, but there are so many differences in the description that I think the present species must be quite distinct. As compared with all the species I have seen, our plant has two very marked characters. The lip is small, unusually fleshy, and so shallow as to be almost filled up by the three central keels and the numerous radiating ones, while the colour is light maroon-purple. The sepals are narrower than usual at the base, and then gradually attenuated right to the apex. The plant has now passed into

* *Masdevallia Lowii*, Rolfe, n. sp.—Plant densely tufted, leaves lanceolate, subacute, bright green, 4 to $5\frac{1}{2}$ inches long, $\frac{3}{4}$ to 1 inch broad. Scape horizontal or ascending, 6 to 7 inches long, with about five sheathing bracts, producing two or more flowers in succession. Perianth-tube 2 lines long; free part of upper sepal narrowly triangular, 1 inch long, gradually passing into the slender tail, which is 7 to 8 lines long; lateral sepals a little longer than dorsal one, otherwise not different, united for 3 to 4 lines; all the sepals minutely asperulous-pubescent, very densely marbled and dotted with dark maroon-purple on a pale ground; tails palest green. Petals nearly 2 lines long, palest green, with a purple line down centre of basal half; apex dull purple, a little club-shaped, with the usual keels and warts of this section. Lip pale maroon-purple, 3 lines long, basal portion with a pair of blunt curved keels; apex fleshy, and scarcely acetate, with three longitudinal keels, and many radiating ones near margin. Ovary not winged; column with three slender bristles at apex.

the collection of S. Courtauld, Esq., Bocking Place, Braintree, Essex, from whom a second raceme has been received. It is an elegant and very distinct little plant. *R. A. Rolfe, Herbarium, Kew.*

CAMELLIAS.

ONE of the uses of conferences conducted by the Royal Horticultural Society consists in the re-kindling a partially extinguished interest in some particular flower. The Camellia might be fittingly made the subject of a conference in which the end just indicated, is kept in view. It is one of those flowers smell upon for a time by fashion, but now in danger of being relegated to something like an undesired obscurity. A warm word of praise is due to Messrs. W. Paul & Son, of Waltham Cross, for the admirable representation of this fine winter and spring flower which they set forth at the meeting of the Royal Horticultural Society at the Drill Hall, on the 11th inst. One could see at a glance what a large number of fine

becoming cupped; but they are occasionally striped or flamed with white.

There are some very attractive varieties among the rose-shades, such as Commendatore Betti, bright rose, a large and well-formed striking flower; L'Avenir, pale rosy-pink, somewhat reflexed, and very good; Bella d'Arignone, rose, with slight narrow veins, good shape. Elegans, bright pinkish-rose, semi-double; Fatima, rose, with a white flake down each petal, good shape; and Madame Lebois, deep rose, small in size, but of very fine shape.

Of pink shades one of the most attractive is Countess of Derby, soft pink, good shape, and very pleasing, as it is described as white, broadly flaked with rose. Baron de Vriere is also of a soft pink or peach shade, with a broad flake of white along each petal. A very delicate and pretty variety is to be found in Mrs. C. A. Hovey, of the same character as the foregoing, but paler in tint, small in size, but very pleasing. Adeline Benvenuti has a blush-pink ground, with slight carmine stripes, a charming variety when at its best. So is Madame

ficata of merit. It is a very fine variety, with a large shell-like petal, full, handsomely reflexed, and said to be later in blooming than the old double white; it is also very free, and a good grower. *R. D.*

A HISTORY OF ENGLISH GARDENING.

(Continued from p. 269.)

ELIZABETHAN GARDENING.*

(*n*) THE FLOWER GARDEN.—In a preceding article we noticed that in the latter part of the fifteenth century Flemish modes of decoration—railed beds and topiary-work—were introduced into English gardens, and that near the close of Henry VIII.'s reign, both the Italian and French styles were imported into this country by the "bluff king's" gardeners. These three foreign styles were engrained upon the "old English" garden, and from this curious combination was evolved, late in the sixteenth century, our greatest national style, the so-called Elizabethan. In its broad characteristics this style is peculiarly well adapted to our English climate and scenery, and it certainly deserves a far more considerable share of popular favour than it now possesses. It is, indeed, strange that although so much attention has been paid of late years to the study of the Elizabethan style of domestic architecture for country residences, but little has been done for promoting a knowledge of the style of gardening which prevailed at the same time, and always accompanied it as a very essential part of the design. It is customary to see a not despicable imitation of an Elizabethan house, surrounded by a garden in what is called the "Natural" style, which means a small lawn, with a few small flower-beds cut out upon it in an irregular manner, "after the fashion of the confectioner's ornaments on a tart;" or if a more ambitious style is attempted, it is either an Italian or French garden, altogether at variance with the style of the mansion. Even if an attempt is made to reproduce an Elizabethan garden, and the architect is consulted on its laying out, we shall probably find the "forthrights," *i.e.*, the principal walks, accurately set out; but there the architect's knowledge usually ceases. He can plan a flat surface, intersected at right angles by broad straight walks; but how to fill up the spaces between the intersections is generally considered out of his province. It was as if he had undertaken to erect a building, and having laid down the plans, and drawn the outlines in so far as the general masses went, and left all the detail and most delicate part of the design to the artisan to work out as best he might. It would be obvious that such a man had not half learned his profession, and had undertaken more than he was able to perform; yet few employers detect that the designer who leaves their gardens only half planned, with all the details of ornamentation shirked and omitted, is equally ignorant of his profession, and has no business to undertake the laying out of grounds. The architect feels conscious that he ought to be able to complete his work, and prepare a design for the surrounding of the house which he has built; and therefore, if appealed to, he undertakes it—though he rather despises the task—but being seldom appealed to, he neglects this part of his education, and is incompetent to do the work. It was in Elizabethan times, however, the work of the architect to plan out the gardens attached to the villa; and in old manuscript plans of houses,† and in early works on domestic

FIG. 61.—EUCARIS BAKERIANA. (SEE P. 416.)

varieties are in cultivation; and how much variation of colour they display. No other firm but this famed Hertfordshire one brings such a collection to London. There were to be seen the representatives of some fifty distinct varieties, but this is but a small part of what are grown, for Messrs. W. Paul & Son catalogue as many as 220 varieties, so that they are numerous enough.

Foremost in this collection of cut blooms was C. H. Hovey, unequalled almost for the beauty of its form, and its brilliant hue of scarlet-crimson. So many blooms of this variety were shown, that it must not only be a popular one, but very free also. The old Mathotiana is large and darker, of a maroon-crimson, but of very fine form, and bold shell-like petals; and, like the preceding, having a striking bold foliage. Marchioness of Exeter is of a fine shade of rosy-scarlet; a truly grand flower, with a fine shell-like petal. Bealei, which is reputed to be one of the best Camellias grown, is of a shaded crimson hue, small and somewhat thin, but with a finely-formed petal. Archduchess Isabella de Toscana is also a fine crimson-shaded variety, of a dark reddish rose-hue, and fine petal; a flower that cups a great deal. Rose de la Reine is of a similar shade of colour, but the petals reflex instead of

Ambrose Verschaffelt, delicate pink, with a distinct white margin to the petals—stout shell-like petals. Comtesse de Hainault is of a very delicate peach, paling to white on the petal edges, very pleasing indeed.

The leading white-flowered varieties in the collection are Montironi, and its variety Vera, the former very pure and much reflexed; the latter much more cupped, and having a delicate citron centre. Alba plena very good indeed; Countess of Orkney, very nearly pure white, but frequently flaked with carmine; Nymph Egeria, pure white, much reflexed; and Princess Charlotte, pure white; a fine flower, frequently faintly blotched with rose.

The best blush-tinted flowers were Romaniensis, blush, with slight flakes of rose; and Cap de Beauty, of similar character, and of perfect form.

Of striped flowers, mention may be made of Archduke Carl, deep reddish-rose, flaked with white; Princess Clotilde, white, striped with carmine, semi-double; and Prince Albert, white, blotched, and flaked with carmine; very pleasing when in good character.

Among the white varieties should be mentioned La vestale, which Mr. Harry Turner brought from Slough, and which was awarded a First-class Certi-

* Under this heading will be included Early Jacobean gardening, which it is impossible to keep distinct from Elizabethan.

† The French Renaissance style was employed at Westminster as early as 1556 (see *Privy Purse Expenses of Princess Mary*, p. 18). In 1564 we find Sir William Cecil carrying it out at Burchley (see *State Papers, Domestic*, vol. xvii., p. 40); and in 1583 Queen Elizabeth had it carried out in the Privy Garden at Hampton Court (see *Gard. Chron.*, vol. iv., p. 377).

‡ See a most interesting old collection of drawings by John Thorpe, one of the most celebrated of Elizabethan architects preserved in Sir John Soane's Museum.

architecture, there is scarcely a ground-plot not laid out as a parterre or a labyrinth. That it is otherwise now is really the fault of the employer. When a man has built a house, he thinks he has done with the architect, and sends for the landscape gardener. The landscape gardener who, for the most part, is more ignorant of architecture than the architect is of landscape gardening, has not the remotest suspicion that the garden should harmonise with the house. He has certain rules, according to the fashion of the time, and whether appropriate or not, he lays out the garden according to those rules in the prevailing taste of the day. He has no more idea of appropriateness than the milliner, to whom the prevailing fashion of the hour is the only guide, and with whom one pattern serves for all alike. Of course neither the milliner nor the gardener is to blame; while ignorance prevails among their employers, and fashion reigns sole arbiter, they must comply with their employer's demands; for ruin would await the presumptuous heretic who dared to dispute fashions' decrees.*

We said above that it was, in Elizabethan times, the work of the architect to plan out the garden attached to the mansion, and that he always considered it strictly to be a pertenance and continuation of the house. In order, therefore, to bring the garden into harmony with the building, and make it as a part thereof, he designed a large, broad, and raised terrace,† to run along the private front of the house, and command a view of the whole design. He then built broad flights of steps,‡ so as to connect the garden with the principal walks, which diverged in straight lines, and which were intersected by similar walks parallel to the terrace. The walks formed the main lines of the design, and the intermediate parallelograms were filled up with mazes or grass plots, or with beds and curious knots. Thus, a uniform plan, harmonising and answering to every feature of the house, was presented. The "forthrights" of the garden corresponded to the ground plan of the building, and the mazes and knots to its ornamental details, its pillars, friezes, niches, and carved capitals. The peculiar geometric tracery which surmounted so many Elizabethan buildings very closely corresponded to the geometric beds of the Elizabethan period.

The shape of the Elizabethan garden was usually a square; "the form," says William Lawson,§ "that men like in general is a square;" and Parkinson, writing in 1629, tells us that it was chosen in preference to "an orbicular, a triangle, or an oblong, because it doth best agree with a man's dwelling." This square was generally enclosed by a high wall of brick,|| or of stone, over which Rosemary was trained. Hentzner, who visited Hampton Court in 1598, mentions that he saw there "Rosemary so planted and nailed to the walls as to cover them entirely, which is a method," he continues, "exceeding common in England." Gerarde¶ and Parkinson also tell us that it was the custom to plant it "in noblemen's and great men's orchards against brick walls." In the North of England, according to Lawson, the garden walls were often made of "drie earthe" instead of brick or stone, and when this was the case, it was customary to plant "thereon Wallflowers and divers sweet-smelling plants." Hedges were also commonly used to enclose the Elizabethan gardens. Bacon recommends that the garden "is best to be encompassed on all four sides with a stately arched edge; the arches to rest upon pillars of carpenter's work, some 10 feet high, and 6 feet broad; and the spaces between of the same

dimensions with the breadth of the arch." Quickset* was the material generally used for such hedges, but Privet, Box, Holly, and other evergreen shrubs were sometimes employed; with these, Roses, Sweetbriars, Honeysuckle, Rosemary, and other sweet-smelling plants were often interlaced.†

The "ordering of the garden within the walls was," according to Lord Bacon, "left to variety of device." There were, however, certain features which were never absent from the Elizabethan flower garden. Parkinson, writing in 1629, enumerates the principal of these. "In the garden," he says, "be squares and knots, beds, walks, a maize or wilderness, a rocke or mounte, . . . great Turkeie jarres, . . . and arbours."‡

The walks which formed the main lines of the design, were "broad and longe, and covered with gravel, sand or turf."§ When of grass, they were, it would seem from a passage in Lord Bacon's *Essay on Gardens*, sometimes planted with Barnet, wild Thyme, and Watermints,§ which, "being trodden upon and crushed, perfumed the air most delightfully." The walks were also "eyther open or closed, eyther public or private."¶ Sometimes they were planted on both sides with Cypress or fruit trees.¶ Describing the Cypress, Parkinson writes:—"For the goodly proportion this tree beareth, as also for his ever grene head, it is and hath bene of great account with all princes, both beyond and on this side of the sea, to plant them in rows on both sides of some spatious walke, which, by reason of their high growing, and little spreading, must be planted the thicker together, and so they give a pleasant and sweet shadow."** Sometimes the main walks were bounded with trees, which were wrought into hedges and arched over at the top. These formed the "thicke pleached alleys" or "covert alleys," which are so often mentioned in Elizabethan poetry. Shakespeare, in *Much Ado about Nothing* (act i., scene 2), tells us of Don Pedro and Count Claudio walking in "a thicke pleached †† alley" of an orchard and Lord Bacon speaks of a "covert alley upon carpenter's work about 12 feet in height, by which you may go in shade in your garden." Various kinds of shrubs were used for making these "pleached alleys." "Every man taketh what liketh him best," says Parkinson, "as either Privet alone or Sweet Bryar and Whitethorn interlaced together and Roses of one, two or more sorts placed here and there amongst them." Willows, Lime trees, Witch Ems,‡‡ Horn-beans and Cora-el trees were also used. Of the latter Parkinson writes:—"Some plant Corneel trees and plash them or keep them low to form them into a hedge; and some again take a low prickly shrub that abideth always green, called in Latin *Pyracantha*."

After the "thick-pleached walks," the two most prominent features of the Elizabethan gardens were the mounds and arbours. In the larger gardens the mounds were generally raised in the centre of the square. "I wish," says Lord Bacon, "in the very middle, a fair mount, with three ascents and alleys, enough for four to walk abreast; which I would have to be perfect circles, without any bulwarks or embossments: and the whole mount to be 30 feet high surmounted by a fine banquetting-house with some chimneys neatly cast." Such a mount was to be seen at Hampton Court, Theobalds, and in many

other large gardens in the early seventeenth century. In smaller gardens "little mounts" were raised, and these, according to Lawson, were surmounted by small arbours "whereabout," as he says, "the Woodbine may claspe." The Elizabethan garden was never without sundry arbours. "You may make herbers," says Thomas Hill,§ "either straight running up, or else vaulted or close over the head like to the Vyne herbers now-a-dayes made." They were sometimes, as Spenser says,—

Framed of wanton Ivy flowering fair,
Through which the fragrant Eglantine did tread
His prickly arms, entrailed with Roses red,
Which dainty odours round about them threw,
Floury Queen, ii., v. 29.

Often they were made of Quicksets,‡ Privet,‡ or "of Roses trayled over trellis-work of Juniper wood or Willow poles," and "decked with that sweet tree or flower named Jacemie,"§ or else with Rosemary,|| Myrtle,¶ Kidney Beans,** red Currants,†† Honeysuckle, single ‡, and double; §§ or with "Ladies Bowers both white, and red, and purple, single and double, which," says Parkinson, "are the fittest of all outlandish plants to set by arbours and banquetting houses, that are open both before and above to help to cover them, and to give both sight, smell and delight." (Paradiseus, p. 10.)

Mazes and labyrinths were probably to be seen only in the gardens of the richer classes of the community. Thomas Hill, writing in 1563, gives directions for constructing a maze, and recommends that in the middle of it be made "a proper herber decked with Roses," or "else with some fayre tree of Rosemary, or other fruit, at the discretion of the gardener."|| He also gives two designs for mazes, and writes:—"Here, by the way (gentle reader), I doe place two proper mazes, as proper adornments, upon pleasure to a garden, that whoso liketh, having such room in their garden, may place the one of them that liketh them best, in that wyde place of the garden that may best be spared, for the only purpose to sport them in at times." Lawson also gives designs and directions for making mazes, and says that when they are "well formed of a man's height, your friend may perhaps wander in gathering berries till he cannot recover himself without your help." He further adds that they were made of Quickset, or Privet, or "plashed fruit trees;" and Thomas Hill says that "there be some which set their mazes with Lavender cotton, Spike, Majoram, and such-like."

The Elizabethan flower garden often contained a fountain, sometimes several; for, as Bacon says "they are a great beauty and refreshment." They were generally made of marble, sometimes richly-gilt, and ornamented with statuary.¶ In some of the more stately gardens a *jet d'eau* was made—a feature which, from its name, would appear to have been introduced by the French gardeners. Hentzner describing the gardens at Whitehall as they appeared when he visited them in 1598, tells us that there was "a *jet d'eau*, with a sundial, which, while strangers are looking at it, a quantity of water forced by a wheel which the gardener turns at a distance, through a number of little pipes, plentifully sprinkles those that are standing round."*** *Percy E. Newberry.*

(To be continued.)

* The price of Quicksets ranged from 1s. a thousand in 1563 to 2s. 6d. a thousand in 1601. Privet was sold by the burden, which averaged in price about 1s. See Roger's *Agricultural Prices*.

ORCHID NOTES AND GLEANINGS.

THE DELL, EGHAM.

In Baron Schroder's collection, the Dendrobates make a splendid show, and among them the old favourite, *D. nobile*, which has of late years been reinforced by many distinct varieties, contributes the greatest profusion of flowers. For richness of colouring *D. n. nobiliss* is still the best, but *D. n. elegans*, *D. n. majus*, *D. n. Sanderianum*, and some others from imported plants, are highly coloured and distinct. Among white varieties, the beautiful *D. n. Sanderianum* is the best, its flowers being larger and its growths stronger than those of *D. n. album*, which is also in flower at the Dell. The varieties of *D. Wardianum* at The Dell seem to be as numerous and as varied, and in much the same way, as *D. nobile*. The best at present in flower is a form which takes the place among the *D. Wardianum* group which *D. n. nobiliss* does among that of *D. nobile*. Its flowers are large, the sepals appearing almost wholly crimson, on account of the heavy colouring of the outside; the petals are purplish-crimson for about one-third of their length, and the labellum is also larger and more highly coloured than that of any other form—it is, indeed, a gorgeous flower. Also in flower were two forms of *D. W. album*, one having only yellow at the base of the lip, and the other an additional chocolate-brown blotch. The remarkable supposed hybrid between *D. Wardianum* and *D. crassinode*—*D. Wardiano-crassinode*, and the exquisite hybrid of Messrs. Jas. Veitch & Son—*D. micans* ×, a cross between *D. Wardianum* and *D. litiflorum*—were in flower. Of the varieties of *D. macrophyllum*, a fine specimen of the rose-coloured *D. m. giganteum* was in great beauty; also the bluish-white *D. m. Burkei*, which is equal to it in size; and the pure white *D. m. Dearei*, which has smaller flowers. Also well bloomed were *D. Brymerianum*, *D. Harveyanum*, *D. transparens*, *D. litiflorum*, *D. Leechianum* ×, *D. crepidatum*, with twelve flowering pseudobulbs, and many fine *D. crassinode*, *D. barbatulum*, *D. aggregatum majus*, *D. Findlayianum*; the beautiful hybrids *D. Aspicia* × and *D. eumium leucopictum* ×; *D. endocharis* ×, *D. aureum*, and a new form of it, with orange-coloured flowers and the Violet fragrance of the pale-yellow form. Of the *D. thysiflorum* and *D. densiflorum* section, many large specimens were showing numerous spikes; and some of the plants of the old, but still far from common, *D. Farneri* were showing dozens of already advanced spikes.

Of the cool-houses the great attraction was the now famous *Odontoglossum crispum Stevensii*. The plant this year has a branched spike of twenty-four large white flowers heavily spotted with bright cinnamon brown. It is a superb flower, and like all the other really first-class forms of the spotted-crispums, there is a character about it which makes comparison difficult. In the same house were several hybrids unnamed, of great beauty—one of them with the blood-red markings, and some of the other features of *O. Jacobianum*; another is of a bright Cowslip yellow, with but a dozen or so small spots on the segments near the column.

A fine *O. Rackerianum* had a branched spike of forty-five flowers; *O. Edwardii*, two spikes 3 feet to 4 feet long of violet coloured blossoms, and *O. Wilkeanum* had several worthy representatives; and many others were in flower. In the cool-houses were many flowered plants of *Masdevallia Lindleyi*, of *Lycaste Skinneri*, and of *L. plana*, *Trichopilia*, and *Burlingtonia fragrans*. Of *Cymbidium* several *C. eburneum* were in flower, a single specimen of *C. Lovianum*, with twenty-nine spikes and several smaller ones, and a fine plant of the rare old *C. devonianum*.

The collection of *Cypripediums*, rare and otherwise, consists of mostly large plants well grown in every way, and well cultivated.

In the Cattleya-houses we noted that the *Trianas* here, as in many other places, have not been up to their usual mark this year. The fine *C. T.*

Schroderiana holds its own as a most perfect flower, *C. T. Osmani* as one of the richest coloured, *C. T. Leeana* as one of the largest, and the other named varieties preserve their characteristics, but not in the marked degree that they do in what growers call a "Triane year." *Cattleya Schroderae* and its white variety were in bloom, and several plants of the noble *C. labiata Luddeamiana*, which has flowers as large as those of *C. gigas*, and which are very fragrant. There is a white variety of this species in bloom, and also named *C. L. Schroderiana*. In the Cattleya-house was a specimen of the brilliant *Laelia cinnabarina*, bearing ten spikes. The large specimen of *Sobralia xantholeuca* promising to have scores of its large golden flowers presently, and the large collections of hybrid *Laelias* and *Cattleyas* were showing well for bloom. Numbers of plants were noticed in bloom of *Calanthe Regnierii*, *Platyclinis*, a few *Phalopsis*, an *Angraecum citratum*, and varieties of *Miltonia Roezlii* arranged effectively with foliage plants and Ferns. Outdoors the *Rhododendrons* promise a great show of bloom, and the latest improvement; the extensive rockeries, whose beauties Mr. Ballantine more than doubles by his skilful planting, is well worthy of a garden which the Baron takes a pride in making equal to any of its size in the country.

ORCHIDS AT THE WOODLANDS, STREATHAM.

A few days ago, by permission of Mr. R. H. Measures, I was allowed to inspect the Orchids at the above place, where, with Mr. Abrahams as pilot, I made the following few notes which will probably be interesting. Mr. Measures has for a long time held a good reputation for his admirable *Cypripediums*, and one needs only to look in at the door of the house to see that all the plants are healthy and vigorous. The house is fitted up all round with sloping stages, in the centre is also a stage of similar construction, and I may say a construction admirably adapted to the requirements of the plants. Notable amongst the plants in flower was a strong and healthy *Cypripedium concolor*, carrying some large well-marked flowers. Another was seen in *C. Harvisianum vivicans*, a very fine variety, and an improvement on the type; the dorsal sepal is rather twisted, as are also the petals, the lip is large and handsome, and in colour the flower is somewhat richer than its type. A fine plant of *C. selligerrum majus* in flower shows to advantage the distinctness of this variety when placed against the ordinary form; the dorsal sepal is large and beautifully marked with dark brown. *C. Mesasuresianum* is a hybrid between *C. villosum* and *C. venustum*.

Several good plants of *C. Sedeni porphyreum* and *C. S. candidulum* were noticed. The collection contains a splendid plant of *C. Morgania* in excellent health, which was flowering beautifully. Mr. Abrahams told me that it is not uncommon to have as many as three flowers on a spike. A pretty form of *C. insigne*, named *Woodlandense*, was found in a cooler house. It is a handsome variety, with the dorsal sepal heavily blotched with brown on a greenish-yellow background, and with a pure white margin; the slipper is almost white, a distinction hitherto unequalled in the *insigne* family.

Lycaste Skinneri Jamesiana is certainly a fine variety, that compares favourably with such varieties as "Young's," or, as others call it, *Armeniacae*; it is pure white, save for the base of the petals, which is of a healthy rosy-blush; there is also deep colouring inside the throat at the base of the column.

Cattleya Triane Mesasuresiana, a novelty, which flowered from an importation of Messrs. Sander & Co., is a most exquisite thing in its way; the flower of a large size, the sepals and petals rich mauve colour, and very broad and shapely; the lip large and well formed, and from the base to the centre is one large blotch of the richest crimson. A picture for *Reichenbachia* has been made from this plant. *W.*

TWO GRAND ODONTOGLOSSUMS.

At present in flower in the collection of F. C.

Jacomb, Esq., at Cheam Park, Cheam, noted for its fine *Odontoglossums*, is a form of *O. crispum*, which for massive flowers and fine shape excels all which have been previously bloomed. Its flowers are over 4 inches across, the petals nearly 2 inches broad, the sepals and petals white, the latter finely fringed, and the former having a large irregular brown blotch. The lip is large and crimped at the edge, yellow at the base, and with half a dozen or so brown blotches in the middle. This fine variety came in an importation of Mr. Shuttleworth's in 1888, one which has been prolific in good things, but none equal to the subject of this note.

A superb form of *O. Humeanum* is the other novelty at Cheam Park. Its flowers exceed the type in size; the sepals are evenly barred with lines of purplish-brown spots; the petals white at the edge, primrose in the middle, with some large purple blotches; the lip clear white, with a primrose-yellow stain at the base. *O. Humeanum* is a supposed hybrid between *O. cordatum* and *O. Rossii majus*, and that now in flower with Mr. Jacomb must have sprung from a very high example of *O. Rossii majus*, as its flowers equal the very best of that species.

LÆLIA FLAVA, &c.

This, one of the most striking of Orchids, is in flower at Clare Lawn, East Sheen, at the present time. The plant has a scape of 2 feet in height, carrying twelve beautiful yellow flowers. It grows best in a pot filled to within an inch of the rim with crocks, elevating it on a small mound of peat and sphagnum moss, and affording it similar treatment to other *Lælias*, that is, copious supplies of water during the growing season, and gradually decreasing the supply after the growths are completed, very little being required during the resting period.

Two other Orchids of equal beauty, and worthy of cultivation in every collection, are *Angraecum citratum*, a native of Madagascar, and *A. Leonis*, from the Comoro Islands. We have several plants of the former carrying ten of its graceful pendulous racemes, some of which are 12 inches in length. The flowers are yellowish-white, and slightly fragrant.

Angraecum, or, more correctly speaking, *Aeranthus Leonis*, is a very distinct and handsome Orchid, with its sword-like leaves and white flowers, as many as ten being sometimes found fully expanded at the same time on a plant of eight leaves. Both of the above species are grown best in baskets, with a few crocks with charcoal for drainage, and living moss as a surfacing. They should never be allowed to get dry at the root, and especially does this hold good of *A. citratum*, else the leaves will turn yellow. Coming, as they do, from very hot and moist countries, they naturally require the temperature of our warmest Orchid-houses, viz., the East Indian. *W. H. J.*

FLORISTS' FLOWERS.

BIRMINGHAM PRIMULAS.

UNDER this name may very fairly be classed two varieties of Chinese Primulas, raised by Mr. Rose, at Sparkhill Nurseries. *Princess Louise* is a white, with large well-formed flowers of great substance, and with distinct stout fleshy foliage and good habit, throwing up its flowers on stout foot-stalks well above the foliage. The Marquis of Lorne is similar in habit, form and size of bloom, and in foliage, but is of a bright deep rose colour fading to a paler colour. It is in colour sometimes called crimson, but we have not yet got a really crimson Chinese Primula.

A few very fine varieties have been raised from these varieties, of which one is *Emperr*, a bright cerise, of finest form, large size, and of good substance. Another seedling from *Princess Louise* is the *Queen*, possessing very stout Fern-leaf foliage, and pure white flowers, with large Orange-yellow centres, and also of great size and substance. A plant of this very fine variety, exhibited by Messrs. Thomson, was selected as the best specimen

Primula out of about 350 plants staged, at the last November Chrysanthemum Show, and awarded the premier prize. A seedling from the Queen, named Her Majesty, and not yet sent out, is just like the parent in every respect excepting colour, which is of a charming pale pink tinted colour.

Unfortunately, these Primulas are not free seeders, and it is with difficulty that much seed is obtained; Mr. Herbert, the foreman here, sows seed in July as soon as it is gathered, to produce plants in flower in February and March, and grows on the same plants for November and December blooming. The soil he uses is good stiff turfy loam, with leaf soil, decayed cow manure, and sand. No artificial manures are used except for exhibition purposes, and then in a very moderate way. *D. S. H.* [The flowers and leaves sent were rather wanting in refinement. En.]

LIQUID MANURE FOR GARDEN AND ORCHARD.

PERHAPS it might have been more appropriate had this paper been headed "The Abuse of Liquid Manure," as it is nearly as often abused as used. How often does one find, when passing a farmyard, this valuable aid to the gardener running to waste from cattle-sheds, stables, &c., and perhaps polluting a stream unnecessarily. This is the abuse of liquid-manure, and the example of it may be often found close to an impoverished garden or orchard. This sort of waste goes on everywhere, although the gardener complains that he cannot get dung enough for his needs. It cannot be denied that the most successful competitors at shows with Leeks, Celery, Cauliflowers, Cabbages, &c., make great use of manure in this form, and I am acquainted with many amateurs who could beat professional gardeners in these things, and their success depends largely on liquid manures.

Some ten years ago I had under my charge a garden in the North of Scotland, which had been neglected as regarded manuring; and when the soil of a garden has once got poor, it takes a little time, even with a good supply of ordinary stable-manure, before it is got into good heart again. Fortunately there existed a large manure-tank for the sewage of the cow-houses and stables, and which at the time was overflowing into a drain, and was lost. How long this waste of manure had been going on no one seemed to know. The pump that had been put there when the tank was made was suckered, and in bad order. I caused the pump to be put into good order, and a 40-gallon petroleum cask was fitted on to a sort of wheelbarrow frame, somewhat similar to the iron water-barrows now in use, and which answered the purpose very well. During the winter I had the liquid put on all vacant ground by means of a piece of a water-can spout flattened down so as to leave a space of about a quarter of an inch in width. Besides pouring it on all the vacant ground, as I have said, when the ground was thoroughly moist I applied it to the wall trees, small fruit bushes, Rose trees—in fact, everything came in for a share of it. The Vine and Peach borders were in poor condition, and these came in for a good share of the liquid all through the season, the outside borders having doses of it after a day's rain, and such days are common in that part of the kingdom. The inside borders were first well watered with clean water before applying the manure. The Vines ripened a fair crop the first year, and made splendid wood for the next season. The foliage had that fine dark-green hue which indicates health. Turning to vegetables, the benefit these derived from the liquid was marvellous. One instance in particular may be cited. One half of a break of Veitch's Autumn Giant Cauliflower had ordinary dung dug in, the other half had the liquid poured on after it had been dug; the latter treatment produced the best Cauliflowers by far. Celery, Leeks, Onions, Peas, came in for their share of it, and were greatly benefited.

New drainage being wanted for the stables and laundry at my present place, I suggested to my employer that the drainage should be conveyed to two tanks, one to receive the stable drainage, and the other the laundry water. This, with pumps for emptying the tanks into a water-barrow drawn by a pony, was readily granted. The water from the stables is being applied to some scores of trees of Apple and Pear on walls and in the open. Although the trees have seen a good many seasons, they are, with the exception of a very few, wonderfully free from canker. It could easily be seen by the appearance of the fruit-buds and weak terminal growths that the soil they grow in is exhausted. I feel certain that the liquid-manure which we have applied, and will continue the use of, will renew their vigour in such a way that they will yet yield some fair crops of fruit.

There is a right and a wrong way in doing everything; and to pour liquid-manure just around the stem of a tree would be the wrong way of applying it. First carefully examine the soil about the trees with a digging-fork, and ascertain where the main part of the feeding-roots lie, and apply the manure-water to the soil in that part, bearing in mind that the ground must be thoroughly soaked with rain, or artificially with clear water, and then there is no danger of injuring the tree.

The soapy water from the laundry tank is useful, and we have been applying it with the garden-engine vigorously to the wall-trees, to get rid of the larva of insects injurious to the leaves during the summer. We shall use this water during growth whenever insects make their appearance. Should the "fly" attack Turnips, or the maggot young Onions, the soapy water will be applied to these crops, and besides acting as a check on the spread of these pests, as I have no doubt it will, to a certain extent act as a stimulant to growth. After the trees were syringed with it, some was poured on the ground around the roots of Raspberry bushes and fruit trees, side by side with the liquid-manure from the stable tank, and I am awaiting results. *J. Jeffrey, Carrislaw Park.*

PREPUSA HOOKERIANA.

In Nicholson's excellent *Dictionary of Gardening* this remarkably handsome plant is said to be "probably not now in cultivation." The sketch, taken by Mr. Weathers recently in the nursery of Messrs. Sander & Co. (see fig. 62) shows that this surmise is happily incorrect. Prepusa, so called from *prepupa*, conspicuous, is a genus of Gentianids. The particular species here figured comes from Brazil, whence it was introduced to Glasgow and Kew by Gardner. It was illustrated in the *Botanical Magazine*, t. 3000. It is a perennial herb, with much of the habit of a *Lychnis* or *Silene*, with tufted linear-oblong leaves, and a loose inflorescence, bearing bell-shaped flowers on long stalks. The distended bag-like calyx is of a purplish-red colour, and from its mouth project the five or six lobes of the white corolla. Many of these Gentians, such as *Lisianthus*, are difficult to cultivate, and it would be of interest if some of our friends who have had experience in their culture would communicate their results.

THE APIARY.

EXPERIENCE OF THE PAST WINTER.

I HAVE been experimenting as usual with several stocks of bees during the winter, and having examined them on Friday, March 21, am able to give some data upon which to work another season. Formerly, when I packed up bees for winter, I put some brandy-balls on the top of the frames, or the skeps, as the case might be; but I happen to live on the verge of Salisbury Plain, where the village shops, though they contain "mouse traps and other sweets," do not often contain brandy-balls. I have, therefore, been induced to try dry sugar, and have

had much success with it. I take large basins, holding about 5 or 6 lb. of sugar each, and tie cheese cloth over the top of each basin, and then invert it over the bees. Many people say the bees will not eat dry sugar in winter time. Last Friday, finding the basins rather light, I looked inside, and found several basins empty; some were half empty, and some nearly full. In every case, however, the bees had not only commenced the attack, but had made considerable progress towards emptying the basins. I have no doubt that the general mildness of the winter had something to do with the empty basins, but not all, for I have tried the same in previous winters, which have been anything but mild, and the same results have taken place. If the basins are put exactly over the cluster of bees, the heat is sufficient to moisten the sugar, and the bees are able to take it. I am quite aware that the dry sugar theory is opposed by many excellent bee keepers, but theory is of no use when opposed to successful experiment, and I am prepared to show the basins exactly as I took them off the hives to any unbelieving persons. In the cases where the basins were empty, I followed up at once by giving syrup, but where they were only partially empty, I left them on a few days to finish them. Of course, I only put the basins of sugar on those stocks which were likely to run short of stores. On examination, the fact was revealed that there has been an immense demand on the stores, owing to the peculiar character of the season, and it behoves beekeepers to look at once to see that matters are right. There are many who think all is well if the bees are alive on the first day of April; when, alas, all may be wrong. Bees may run short in one night, and die in consequence. *Bee.*

THE GENUS ASARUM.

THE name *Asarum* is, probably, unknown to many of the readers of the *Gardeners' Chronicle*, and, indeed, the etymology of the word is doubtful and variously explained by different authors. Tournefort first employed it as a generic designation for *Asarum europæum*, a species occasionally met with in England as an outcast or waif of cultivation, and later it was adopted by Linnaeus without any explanation of its meaning. There are two or three Greek words from which it may have been derived, the most likely derivation being from *a*, negative or privative and *sairo*, I adorn, in allusion to the absence of ornamental character in the flowers of the European species.

When the first part of the third volume of Bentham and Hooker's *Genera Plantarum*, containing the order to which this genus belongs, was published ten years ago, about a dozen species were known, and these are scattered all round the temperate zone of the northern hemisphere. Since then the total number of species known has been augmented by about half-a-dozen, chiefly from the Chino-Japanese region and one from California; and among Dr. A. Henry's numerous discoveries in Central China is a very remarkable new genus, intermediate in habit, and flowers between *Asarum* and *Aristolochia*.

Not only have we received at Kew a great accession of dried specimens of this genus, but through Mr. Ford, of the Hong Kong Botanic Garden, living plants of three or four Chinese species have been introduced, and have flowered at Kew. As ornamental plants, the prettiest or best of the species do not rank high; yet as they are small, neat, and curious, and produce their flowers in a cool greenhouse, in mid-winter, they are worthy of some attention, and I propose passing in rapid review those that have been, or are, in cultivation, with descriptions of two or three new species. All the species are similar in habit to *A. europæum*, having creeping rhizomes, from which the stalked, usually cordate or reniform, leaves rise, almost concealing the usually very short-stalked flowers.

Asarum europæum, the only European species, is perhaps the least attractive of all, though not uninteresting of a shaded nook in the rock garden. It was

formerly much cultivated as a medicinal herb, and it is now found wild in a few places in England, probably, however, only as an outcast from cultivation. In an undoubtedly wild condition, it ranges from Spain to Western Siberia. Cultivated at Kew.

spring. Sweet states that it flourished in a peaty soil, that it was in full flower in the middle of April, and had then been in flower for a considerable period, although the season was a very backward one. Sweet adds, that there was a large clump of it

This, and other American species, is called wild Ginger. Cultivated at Kew.

A. canadense.—A much commoner species than the last, being found throughout Canada, westward to Saskatchewan, and southward in the eastern United States to North Carolina. This was figured in Loddiges' *Botanical Cabinet*, ix. (1824), plate 889, but the figure is poor, and in the *Botanical Magazine*, plate 2769 (1827). The last was from the pencil of Sir William Hooker, and represents the flowers as crimson with black dots. This was cultivated in England by Bishop Compton before 1713, and is "deserving of a place in every collection." It flowers from April or May to July, and grows naturally in rich forests amongst leaves and dead wood. The flowers are about 1 inch across, and the spreading lobes more pointed than in either of the foregoing. In each sinus of the three-lobed perianth there is usually a small narrow appendage or reduced petal. A third figure of this species in Sweet's *Flower Garden*, plate 95, represents the flowers of a pale brown. It is in cultivation at Kew.

A. arifolium.—This was introduced about the same time as *A. virginicum*, and is figured in Hooker's *Exotic Flora*, plate 40 (1823) from a plant that flowered in the Glasgow Botanic Garden. The flowers are almost entirely green outside; the tube constricted below the lobes, and the lobes infolded. The leaves, however, are usually prettily figured or variegated with white, and nearly hastate in shape. A native of the South-eastern States from Carolina to Florida.

A. Thunbergii, *syn. Heterotropa asaroides*.—One of the larger-flowered kinds, with heart-shaped, variegated leaves, and metallic blue flowers, with markings and tinges of green, and yellow, and purple, or, as represented in the earliest figure (*Botanical Magazine*, plate 3746) in 1839, of a dirty brown, with variously coloured markings and pencillings. A later figure in the *Botanical Magazine* (plate 4933, 1856), perhaps more faithfully depicts the plant, and in this the ground colour of the flower is a blue-green. The flowers are about $1\frac{1}{2}$ inch in diameter, and have an inflated, almost spherical perianth, with reflexed, deltoid lobes. This species is a native of Japan and China, and has been in cultivation under the name of *Asarum japonicum*. The flowers are described as having the perfume of a ripe Apple, and they are produced in a greenhouse in midwinter. It is still grown at Kew.

A. parviflorum, *syn. Heterotropa parviflora*, in the *Botanical Magazine* (1863), plate 5380. A native of Japan, with quite small flowers of a dull purple, almost hidden in the subtending bracts. The perianth is very narrowly constricted in the middle and the lobes are bordered with green. One of the least attractive.

A. albivittatum.—Another Japanese species, similar to the last, but having white-veined leaves and longer-stalked flowers of a yellowish colour, with red spots. It is figured in Regel's *Gartenflora* for 1861, plate 449. *A. leucodictyon* is another name for it.

A. micranthum.—By far the most striking species yet cultivated. A native of Eastern China and the island of Formosa, originally discovered by Richard Oldham, one of my earliest associates at Kew, who collected in China and Japan for the Royal Gardens, Kew, and died from dysentery at Amoy, about five-and-twenty years ago, after a short but not unsuccessful career as a collector. Recently it was rediscovered in Formosa by Mr. Ford, of the Hong Kong Botanic Garden, and he sent living plants to Kew, where they flowered in 1888; and this species was figured in the *Botanical Magazine*, plate 7022. The largest leaves are 4 or 5 inches across, and borne well above the flowers on stout stalks. They are of a shining green above, mottled with white and paler beneath, with a prominent raised venation coloured red. The flowers are about 2 inches across, seated close to the ground, and so numerous that they cover the surface. They are of a rich purplish-brown, and the broad, much undulated, spreading lobes of the perianth are bordered with yellowish-

FIG. 62.—*PTERIS HOOKERIANA*. CALYX, REDDISH-PURPLE; COROLLA, WHITE. (SEE P. 420.)

A. virginicum, a native of eastern North America, was the next earliest species cultivated, or, I should say, the earliest figured. There is a representation of it in Sweet's *Flower Garden*, plate 18 (1823), from plants cultivated by Knight, of King's Road, Chelsea. It grows naturally in shady rocky woods in Virginia and Carolina, southward to Georgia, and flowers in

entirely covered with bloom, and that although the "flowers were not so splendid as some others, they were pretty and curious; and, as they continued a long time, the plant was well worthy a place in all curious collections." The flowers are of a very dark purple, with small white spots on the spreading lobes, but is otherwise much like the common one.

green. Unlike most of the members of the genus, and, indeed, of the order (Aristolochiaceae), this species has a pleasant odour, exactly that of fennel-greek, an odour exhaled by solitary members of several of the most widely separated natural orders.

A. caudigerum.—A Chinese species, originally described by the late Dr. Hance from specimens collected in the province of Kwangtung by Dr. Gerlach; since rediscovered by Mr. Ford, who sent living plants to Kew, where they have flowered this winter. It has been drawn for the *Botanical Magazine*, and the figure will shortly appear. It differs essentially from all the preceding, in the three lobes of the perianth being extended into slender tails an inch or so long, reminding one very much of some of the species of *Masdevallia*. The flowers are of a reddish-purple, and the plant is certainly one that the curious should acquire if possible.

The North American *Asarum Hookeri*, syn. *A. caudatum*, is a closely allied species with larger flowers, sometimes exceeding 3 inches in length. This species has a wide range in western North America, and is figured in Fielding's *Sertum Plantarum*, plate 32. From a somewhat starved specimen in the Kew Herbarium, it appears to have flowered in the Cambridge (England) Botanic Garden in 1881. It is also at the present time in cultivation at Kew.

A. geophilum, Hemsley, n. sp.—Another of Mr. Ford's introductions from the province of Kwangtung, South China. It flowered at Kew early in December, and was drawn for the *Botanical Magazine*. The cordate-orbicular leaves are somewhat fleshy, from 2 to 4 inches across, of a shining dark green, veined with white on the upper surface, and paler beneath. The medium-sized, purple-brown, white-spotted and margined flowers appear scarcely above the surface of the ground. A very pretty species, the foliage alone being sufficiently ornamental, reminding one of some of the species of *Peperomia*.

A. pulchellum, Hemsley, n. sp.—This pretty species is not yet in cultivation, but from the appearance of the foliage, even in the dried state, and Dr. A. Henry's description of the flowers, it must be one of the most ornamental of the genus. The roundish cordate leaves are clothed with long many-jointed, beautiful hairs; and the medium-sized flowers are dark red outside and pink within, and "very pretty." It is a native of Central China, and we may have long to wait before we see it alive, as Dr. Henry has left that region.

A. maximum, Hemsley, n. sp.—Another of Dr. A.

Henry's discoveries in Central China, and, like the last, not in cultivation. It is the largest of the genus known, the leaves being as much as 8 inches across and 18 inches high. The flowers are from 2 to 2½ inches in diameter, flesh-coloured outside, dark purple and velvety within, with a white transverse stripe at the base of each of the rounded spreading lobes.

In conclusion, a few words respecting the singular new genus referred to above:—

Saruma Henryi.—Professor D. Oliver has given this name to one of Dr. Henry's discoveries in Central China, and it is mentioned here on account of its having distinct petals inserted on the calyx, and alternating with its lobes, and equalling them in size. It differs from *Asarum* in having a distinct stem 2 or 3 feet high, and terminal or pseudo-terminal flowers, and in the *a* being at the end instead of the beginning of the name! A figure of this plant is given in Hooker's *Icones Plantarum*, plate 1790. *W. Botting Hemsley.*

PLANTS AND THEIR CULTURE.

PROPAGATION OF PLANTS TO FLOWER IN THE AUTUMN.—Tree CARBONATES: Cuttings should be taken and propagated, and young shoots, if taken now, soon root in a close pit, when put into a sandy compost. The young plants should get shifted when necessary, and be kept clear of green and black fly, which if once allowed to get a foothold on the plants soon disfigure them. For a potting soil plenty of good loam, decayed manure, and a small quantity of old mortar suits them; the plants must be gradually hardened off and not overwatered. *Lasiandra macrantha* may be treated as advised for Begonias. It is a subject worthy of extended cultivation, and looks well when grown in small pots at the above season; if grown through the summer months in a cold frame it does much better than when grown in the stove. Cuttings may be taken now and, when rooted, potted into small 60's and finally potted into 32's, keeping them well stopped throughout the period of growth, and then transferring them to a warm house early in the autumn. *Poinsettias* and *Plumbago rosea*, *Erantium pulchellum*, *Euphorbia jacquincelora*, and *Justicia speciosa*, more correctly known as *Peristrophe speciosa*, should also be propagated. The *Peristrophe* require treatment similar to that given to the Begonias, and they produce much bloom in 5 or 6-inch pots. *Poinsettias* may be propagated if early plants are desired, but for later use the plants may remain dormant awhile longer. We have these plants in succession, and start a few pots early so as to obtain cuttings.

Erantium pulchellum may be increased at the earliest opportunity, so as to secure strong plants at an early date. It succeeds with frame treatment after the final potting, and it is much better so than when grown in a stove during the summer time. Abundance of moisture and frequent damping over on warm evenings are required to promote a healthy growth. *Plumbago rosea* cuttings may be taken off, and when rooted these should be put near the light and the stems trained on pieces of string; it is a plant that will last in beauty for some weeks if carefully looked after. Cuttings taken with a heel and placed in peat, leaf-mould, and sand, in a temperature of 80° soon take root. The plant succeeds best under stove treatment, and should not be starved at the root when growing.

Euphorbia jacquincelora needs to be grown in the same way, and the cuttings should be secured soon. Put three cuttings round the side of a small 60, thereby securing a small ball with each when turning them out. Employ some good loam in the compost, as also in that for *Plumbago*; as the plant increases in size, equal parts peat and loam with a dash of coarse silver sand and a few small pieces of charcoal and ¼-inch bones, suits the needs of *Euphorbia*, manure water being given to them while growing. Cuttings of *Impatiens* should be taken from the old stock plants, and the young stock grown in frames in the summer. *G. Wythes, Syon House, Brentford.*

thium subaequaliter trilobatum, lobis latis rotundatis planis divergentibus, tubo a basi gradatim expanso intus interrupte transversam multiplicat; anthera subaequaliter, uniformes, minute appendiculatae; stylis staminibus superantibus, crassissimis, nigricante papilloso, longe bicurvati vel bifidi, stigmatibus dorali bifido oblongo.

THE ORCHID HOUSES.

EAST INDIAN HOUSE.—If previous directions were acted on with regard to forward plants of Cattleya *Sanderiana* the flower sheaths will now begin to show themselves, and as soon as these are seen the plants should be well supplied with water at the root, and the atmosphere saturated with moisture, to assist growth and keep down thrips. Where several of these plants are in a collection, it is better to get a few in flower in succession, rather than to have them all flowering together.

Laelia majalis that has been resting in a cool dry house will now begin to grow, and should be brought into this house; and as soon as the roots get active, it should be plentifully supplied with water. If the plants made strong growths last year, the new growths will, in most cases, send up flower spikes, and in that case the plants should be hung up to the roof. *Phaius tuberosus* is, undoubtedly, one of the most beautiful of Orchids, and no amateur should rest satisfied until he has a plant of it. It is a free grower, though thrips are its deadly enemies; but these may be cleared off by brushing the plants two or three times a week with a camel's-hair pencil, wet with saliva.

Phalaenopsis which may not have been rebasketed, as advised in a previous calendar, should have that operation done at once, as the longer it is delayed the greater will be the danger of the young tender roots getting broken off. The plants should receive a good sponging of their leaves before being placed again in the house. A well-known grower of *Phalaenopsis* attributed a great part of his success to the frequent use of the sponge, and, I believe, there was some reason in what he said. The temperature may now be increased to 65° at night, and an increase of the day warmth of 10° to 15° by sunheat will be beneficial to the plants. *A. G. Catt, Parkfield, Worcester.*

FRUITS UNDER GLASS.

VINES FRUITING IN POTS.—The Grapes on the above will now be colouring fast, and should not be hurried, time being highly requisite for perfect finish. Black Grapes always colour the best when under the shade of their own foliage, but white or yellow ones require exposure to sun-light to bring out their proper tints. In the vineery where colouring is taking place, avoid a parched atmosphere, on the one hand, and a close one on the other, and steer a middle course, endeavouring to preserve the clean and healthy foliage to the last; and remember that liquid manures given now are inimical to perfection in the colour of the Grapes.

The *Early Vineery*.—These Vines, when planted in outside borders, will require assistance in the form of mulchings of spent Mushroom lung or farmyard manure, and occasionally of manure water, judiciously employed. Carefully ventilate the house before and during bright sunshine, or scorching of the foliage will certainly take place; shut up early, and give a little front air at night. The protecting coverings of outside borders may be reduced gradually in thickness after the middle of April until entirely removed. Train in shoots to cover the trellis, preserve as much of the earliest foliage as is consistent with due space being left for growth, and remove superfluous laterals as fast as they push forth, leaving one here and there to prevent back buds from breaking. Thinning of the berries gives at this season plenty of employment for the gardeners. Seeing that various kinds require different methods of thinning, object lessons are the best teachers, but it may here be stated that *Hamburgh* and other long foot-stalked kinds require less thinning than those having short stalks of the *Lady Downes* type; and in all cases the end in view should be realised as much as possible. Begin operations on a bunch by removing all deformed and seedless berries, as soon as these can be discerned; having done this, the shape the bunch will assume will be made plainer. The young fruits are very delicate, and if rubbed by the hand, the hair, or by the scissors, injury is caused that cannot be removed. Rust is frequently caused by want of care in this matter, as well as by cold draughts, or old sulphur left on the heating apparatus. Muscats in flower will enjoy a temperature of 70° to 75° at night, 80° to 85° by day, and the rods should be rapped a few times daily. The syringe may also be used for the distribution of pollen, but by experienced hands only; and when crystal globules are present on the flowers, the

dry hand may be drawn down the bunch to remove them.

Later Vines.—See to the timely disbudbing of the bunches on these Vines. Increase the temperature at night to 55°; houses of late Black Hamburgs to be kept open day and night till the Vines start of themselves, when they must have generous treatment. Vines cut back for fruiting next year in pots, should be trained to stakes or wires, and the house thoroughly ventilated so as to secure short jointed canes. The leaders may be stopped at 6 feet, and the laterals at the first joint. Encourage stocky growth in Vines struck from eyes this season, and report them before the roots get pot bound.

Peaches and Nectarines.—The early trees should have pieces of lath placed under the branches near the fruit so as to bring the proper top of the fruit towards the sun, and training the shoots of the current year aside. Use the syringe daily, and, if well-drained, the borders should receive abundance of water and sometimes liquid manure. Borders may be mulched with spent Mushroom dung. Avoid hard forcing at night. Attend to the regular disbudbing of shoots and the thinning of fruit in later houses. I consider it to be unwise to allow, in thinning, for a large percentage of fruit to drop off at the stoning period; for whenever this mishap takes place the cause, like that of shanking in Grapes, may be traced to defective root action, bad state of the borders, or previous overcropping. Very gross shoots springing from the middle of the tree should be removed altogether, these being a prolific source of gumming if left; and shoots retained to draw the sap to the fruit should be stopped at one joint, they having previously been stopped at the second or third leaf.

Trees in the late house will be in flower, and the fertilisation of the bloom may safely be left to Nature. A fumigation given the house before the blooms open is a wise precaution.

Strawberries, which may now be cropped more heavily, should now be obtainable in large quantities, and because of this I grow the later successions in 7-inch, midseason in 6-inch, and earlier in 5-inch pots; and always layer direct into the fruiting-pots. Attend to the thinning of the flowers, and place forked sticks to the fruits to prevent injury to the stems, and their contact with the water.

Early Melons which have set, should have the young fruits supported by pieces of sound herring-net of 1 foot square, looped up to the trellis; give a light topdressing of turfy loam, and a dash of some kind of artificial manure; preserve every old leaf, but remove laterals, at the first joint. Plant out successional—beware of thick planting; sow seeds. Keep the stems, when syringing the plants, dry. The temperature at night 70°, closing early, running up to 90°. Melons are benefited by the ammonia arising from sweet fermenting materials, and by being kept free from red-spider.

Cucumbers.—Spring-sown plants should now be covering their trellises, and being rapid growers, topdressings of loam and horse-droppings, little and often, must be afforded them.

Figs should be kept quiet during the formation of their seeds; but pot trees and others early started will soon be ripening their fruits. Stop shoots if more are wanted, and remove crowded growths; but I favour moderate extension. Expose the fruits to the sun, and give liquid manure, or mulch lightly with rich manure. Now is a good time to secure a season's supply of good packing moss, which has no equal for packing, to be got in readiness for the packing of Pines, Grapes, Melons, Peaches, Nectarines, or Figs. In my exhibiting days this material secured for me the Fruiterer's Company's special prize for packing on two successive occasions. *W. Crump, Madresfield Court, Malvern.*

THE FLOWER GARDEN.

BEDDING-OUT PLANTS.—These plants when transferred to frames, as the hardier of them now should be, should be carefully ventilated, and also shaded during bright sunshine for a week after taking them out of the warm houses. In stormy weather or during heavy showers of rain, the sashes should be kept close, or at least with the sashes over the plants.

Verbenas, Ageratum, &c., are better when planted out in frames in loam and leaf-mould resting on 2 inches of leaf-mould, which again should lay on a hard bottom. As the cuttings become rooted and hardened

off sufficiently, they may be placed in the frames at 6 inches apart each way, where they will grow away more freely than in pots, and at planting time may be taken up with good balls.

Propagation of bedding stuff should be forwarded as much as possible, and an estimate taken of the number struck and out of those that are still required for the beds, &c.

Out-of-doors operations.—Lily of the Valley beds should receive dressings of well decayed manure or leaf-mould, and on the top of that put a sifting covering of sifted potting bench refuse. In forming new beds, use the small roots left after making a selection of the best for forcing. Prepare the ground for the reception of young brood, by manuring and deep digging, planting out the roots 3 inches apart in the row, and 9 inches from row to row, and afterwards topdress them.

Violas, which as is well known, give the best blooms on young plants, should, when bloom is over, be increased by planting the stronger young growths which have roots. These may be put into beds or lines at 1 foot apart, the soil being previously enriched with well-decayed leaf-mould or manure. The plants grow best in half shade, and are then not infested by red spider.

Hollyhocks, which are seldom seen now in perfection, should be planted out if the plants raised from slips have been properly hardened off. The preparation of the ground for the plants should consist of trenching it deeply after liberally manuring it.

The Herbaceous Border.—In herbaceous borders, most kinds of plants have begun to grow, and it is a favourable time to give the borders a dressing of manure, and lightly prick it in with a fork. Never use a spade for this purpose, for fear of injury to bulbs and other roots.

Flower Beds, which are to be planted with hardy annuals for an early display of bloom, should be got in readiness, sowing the seeds early in April. For late summer flowering three weeks hence will be soon enough. So great is the variety in hardy annuals that very effective groups and masses may be obtained at small expense, and the display of bloom is equal to anything made with ordinary bedding plants. *D. C. Powell, Powderham, Exeter.*

THE HARDY FRUIT GARDEN.

WATERING TREES.—Fruit Trees against walls should be carefully examined as to their condition at the root, the soil in many districts being dry owing to the deficient rainfall. Apricots, Peaches, Nectarines, Plums, and Cherries should have a thorough soaking. This of course must be done judiciously, bearing in mind that soils, which are light with an open subsoil, require a far larger quantity of water than those that consist of loam, or that rest on a clay subsoil. Where the borders have not been mulched, the surface should be pricked over round each tree previous to applying the water. To allow the roots of wall-trees to become dry is a fruitful source of bud-dropping. After watering lay on a mulch of half rotten manure to the depth of 2 inches, and this should extend to a distance of 4 feet from the wall. Borders thus treated will save much future labour in watering, if the season should prove to be a dry and rainless one.

The Fruit-room should be looked over, and all decaying fruit cleared out of it, and what remains placed at the coolest and darkest part. Apples of the following varieties are keeping well with me:—Court Pendu Plat, Boston Russet, Lord Burghley, and Earle's Pippin, Tower of Giamis, Norfolk Beaufin, and are as fresh as possible. When the fruit-room becomes empty, whitewash the walls and ceilings, scrub the shelves, and wash the floor.

Grafting.—The grafting of Apples and Pears should now be pushed forward, and those not having had much practice must bear in mind, that the secret of success lies in getting a perfect union between the inner barks of stock and scion. In the case of large branches, if one side only of scion and stock coincide, it will be enough. Select for scions well-ripened and short-jointed shoots, and let the scion have from three to five buds. Whip-grafting does for ordinary purposes, but for large trees and branches, cleft-grafting is better. Carry the bind the graft, but not tightly, with matting. Clay is generally used to keep the scion moist; but grafting-wax is sometimes used. A useful receipt for the purpose,

and one that has not the inconvenience of having to be applied warm, is:—Yellow wax, 1 lb.; turpentine, 1 lb.; Burgundy pitch, 8 oz.; Mutton suet, 4 oz.; melt altogether, mix thoroughly, and, when cool, form the mass into small balls for use. *A. Evans, Lythe Hill, Haslemere.*

THE KITCHEN GARDEN.

SEED SOWING.—The work here will rapidly increase in volume, and strenuous efforts must be made to keep pace with it. Peas sown in February will now be up, and if strong growing varieties are very thick in the rows, thinning out may be practised, leaving an inch or more from plant to plant. Draw earth up to the rows, put in the Pea sticks, and in doing so leave a space of about 1 foot between the tops of these, if the Peas are tall sorts. Two more sowings may be made this month of wrinkled Peas, the seed being more sparingly sown than hitherto. Champion of England and Ne plus Ultra are trustworthy varieties for summer use.

Potatoes.—The season has arrived for planting the main crop, and if the ground is in good order planting need not be delayed. Plant no Potatoes on land heavily manured, as this would be at the expense of the crop; and land should be chosen, by preference, that has not carried Potatoes for two or three years. For strong growers, a distance of 2½ feet between the rows is not too much, 1 foot being the space between the tubers. Heavy land should have a liberal dressing of burnt refuse or road scrapings, and planting is best done in a shallow way, not using a dibber, always a bad way of planting in heavy land. In very light soil, on the contrary, a dibber may be used, and it is in some cases preferable to any other implement.

Broccoli and Borecole of the following varieties may be sown in beds well prepared, Snow's Winter White, Walcheren, Veitch's Self Protecting, also Autumn Giant Cauliflower; Savoys, especially Early 'Um, for autumn use; Cabbages, Chou de Burghley, Asparagus, and Scotch Kale. Before sowing, the soil should be made moderately firm, and if mice are troublesome, the seed may be damped and rolled in dry red lead. Sow broadcast in drills, and cover with fine soil, smoothing all over with a bright spade. The late varieties of Broccoli, Savoys, Kale, &c., should remain in their packets for at least two weeks later.

Asparagus roots may now be planted, the growth being forwarder than is usual in April. These must not be exposed before being planted, and should be lifted carefully with a fork from the seed lines. A covering of 3 inches of fine soil should be spread over the roots when they are placed in position in the trench, and made firm about them without injuring the stem. A mulching of short dung may be put over the beds when dry weather sets in.

Rubie Cucumbers.—Seeds of these plants may be sown for planting in May, three seeds being put into a small pot, re-potting the potful of plants as a whole when requiring it. Vegetable Marrow seeds may also be sown in warmth; remove the plants to a cool frame after they acquire strength. *H. Markham, Mereworth Castle, Maidstone.*

PLANT PORTRAITS.

OBONGTOSSEM DUVIVIERANUM is, in the opinion of M. Linden, a hybrid between *O. maculatum* and *O. nebulosum*. The flowers are in racemes, each flat, star-shaped with lanceolate segments, yellowish, spotted with red; the anterior blade of the lip is lozenge-shaped, retuse white with chocolate blotches. *Lindena*, t. 218.

RENANTHRA LOWII, *Revue de l'Horticulture Belge*, March.

RIBESON PIPPIN.—This is figured in the February number of the *Bulletin d'Agriculture*, but the figure suggests rather the Blenheim Orange than the true Ribston.

NONNERIA MADAME H. GRUSON, *Illustration Horticole*, t. 92.—Leaves green, thickly spotted and marbled with white.

VERISEA GRAVIANA ×, *Revue de l'Horticulture Belge*, March. The result of a cross between *V. pottiana* and *V. Barilleti*, the latter being the pollen-parent.

ZALMYRANTHES CANDIDA, *Garden*, February 15.

EDITORIAL NOTICES.

Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor. Such communications should be written on one side only of the paper, and sent as early in the week as possible.

Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are also solicited.

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

TUESDAY, APRIL 8. Royal Horticultural Society: Committee and Lecture, at Westminster.

SHOW.

TUESDAY, APRIL 8. Liverpool Horticultural Association (two days).

SALES.

WEDNESDAY, APRIL 9. Roses, Fruit Trees, Shrubs, Border Plants, and Bulbs, at Stevens' Rooms.

Lilies, Stoves and Greenhouse Plants, at Frotheroe & Morris' Rooms.

Imported and Established Orchids, at Frotheroe & Morris' Rooms.

FRIDAY, APRIL 11. Roses, Greenhouse Plants, &c., at the City Auction Rooms, by Frotheroe & Morris.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—47°·2.

THE Anemone is so general a favourite, that we are sure any remarks on its cultivation from so experienced a practitioner as Mr. WOLLEY DOB will be read with interest. Purity of atmosphere and intensity of light, other things being equal, seem specially necessary for the development of the glowing colour in these flowers. At any rate, our own blooms, grown in a suburban garden in a richly manured soil, and fully exposed to the mid-day sun, are dull and "brick-dust" coloured in comparison with those sent by Mr. DOB, whilst those from Ireland are even more brilliant than those from Cheshire. We append Mr. Dob's letter:—

"The flowering of the scarlet Anemone from the south of France, commonly called *A. fulgens*, but properly *A. hortensis* var. *fulgens*, has this year been so early and so abundant as to deserve record. Many flowers were open by the middle of January, and a month later the flowering was general, and though a good deal damaged by the hard frosts of the first week in March, they have now, at the vernal equinox, nearly recovered the effects, and are flowering more densely than I have ever before seen. They are grown here in masses all over the garden, from a square foot to a square yard, or more in extent, and from

twenty to thirty flowers to each square foot are open at a time. The flowering wanes towards the middle of April, and is quite over by the middle of May. As I frequently hear complaints about the deterioration and failure of this Anemone in cultivation, a few notes on the subject may be useful. The source from which my stock is derived is a vineyard half-way between Bayonne and Pau. Formerly the proprietor of this allowed the roots to be collected by all comers, but since the prevalence of *Phylloxera*, he has become better aware of their value, and supplies many thousands every year to English nurserymen. They are in fullest flower in this vineyard from the end of February to the end of March. The ground between the Vines is ploughed twice annually in the summer and early autumn, and the roots of the Anemones alternately buried and brought to the surface. They seem to flower equally well under either condition. They are collected for sale in summer, and the imported roots are an inch long, more or less, and of the thickness, at most, of an ordinary drawing-pencil. In English cultivation they grow to much larger dimensions, but never produce as many flowers in proportion to their size or of so good a colour as in the first spring after their importation. Still it is now three years since I imported any, and I find that, by attention to a few rules, which I will give, they may be grown for several years, if not permanently, without much deterioration in quality.

"In the first place, sunshine is life to them, and a sunny place a necessity to their welfare. The soil cannot be too rich, and should be moderately strong. There is no right and wrong side to the tubers, which may be laid in the ground two or three inches apart, four or six or more inches deep, in August or September, or later, according to the time at which they are wished to flower. About the end of May, when they have done flowering, they may be dug up and left on the surface to bake in the sun for a few days or weeks, according to the sun's power. I sometimes spread them under a south wall, and when thoroughly dried and shrivelled remove them to a dry shed, where they lie in a heap till planting time. Others I leave, lying on the surface, the whole summer through. Before planting, the tubers should be broken into small pieces, and if they are planted again, in the same place, the soil must be renewed and enriched. There are few more exhausting crops than Anemones; if left alone they become matted together in two or three years, and die of absolute starvation. Where the soil is good, and they are thinly planted at first, they may be left alone for two or at most three years, but they are seldom so good the second or third year as the first.

"As I have imported 2 or 3 lb. of tubers once in two or three years for twenty years, and as they increase fast, the total quantity in my garden has become very large. Abundance causes carelessness; clumps get neglected till they seem past recovery, and in a year or two some have quite disappeared, and I often label them, though rather casually, with the date of importation, and am sure that I have many lots in full flowering condition which have been ten years in my garden. A hot summer has great recuperative influence, and two or three sunless years together produce a marked deterioration; but I believe that in more sunny counties than Cheshire there need be no limit to the duration of their flowering qualities, if they are properly treated. I attribute the remarkable abundance of flowers this season to the very sunny June of last year, and their earliness to the wet summer and autumn, which started all spring bulbs prematurely. Those flowers which are produced during January are deficient in colour, tending towards brick red; and when grown under glass, this deficiency is still more marked. They never attain in Cheshire to the dazzling scarlet they display in their native vineyard. Ten degrees of frost spoils all the flowers which are open; and fifteen degrees, when they are in flower, withers and turns the leaves brown to an extent from which they do not entirely recover, the subsequent flower-

ing being somewhat stunted. The only disease to which I have observed them to be liable is one which causes the leaf stalks to rot through at the base, leaving them loose in the ground. I believe this occurs when they are beginning to feel starved, as I have never noticed it in newly-planted ground. This variety is the only one of the species which I have cultivated with success. Other forms of *A. hortensis* have often been sent to me from the Riviera, but fail for want of sufficient warmth, and the deep rich scarlet variety known as *græca* hardly survives a cold season.

"I have made enquiries about the cultivation of *A. hortensis* var. *fulgens* in the Scilly Isles, where the climate might be thought well suited for so early a flower, but I find that it has been tried with very indifferent success; though I believe the annual drying has not yet been adopted there. These bright flowers are highly appreciated in the season of Crocuses, wherever I send them."

Mr. MARKHAM furnishes us with the following cultural directions:—

"The tubers are usually planted in October if required to bloom the following April, and sometimes many of their dazzling blooms open in March. The quickest way of getting up a good stock of tubers is to raise them from healthy seed. If the seeds are sown now they will make nice plants that will bloom next spring. The seed may be sown on well prepared beds outside; but owing to the slowness of germination and the risk of damage in keeping the beds free from weeds before the plants are up, it is well to sow in boxes or cold frames, and to transplant the seedlings when large enough into rich soil. If the seed is to be sown outside, the soil should be well worked. The seed should be sown in drills, and covered with fine sandy soil. When the plants are well up they should be thinned to 2 inches apart or more if required. The seed is somewhat difficult to separate, owing to its being woolly, so that it should be well rubbed together with dry sand. If sown in boxes or pans they should not be placed in heat, a cold frame being a more suitable position to bring [forward the seedling plant till well up, and large enough to put out.]"

LYCASTE SKINNERI ALBA (SEE SUPPLEMENT).—The plant, of which we now place before our readers a representation, is one in the well-grown collection of REGINALD YOUNG, Esq., Linnet Lane, Aigburth, Liverpool, and was the subject of a few remarks in our issue for November 9 last, p. 528. Mr. YOUNG informs us that when photographed the specimen bore sixteen fully expanded flowers, one bud, and that about ten other flower-spikes were starting. It is truly a very showy plant, and this pure white form is one of the most attractive of the numerous variations of *Lycaste Skinneri*.

HORTICULTURAL CLUB.—A house-dinner of the Club took place on the 25th ult., when Mons. HENRI DE VILMORIN was the guest of the evening. There was a very full attendance of members, representing all classes of horticulture, to do honour to their distinguished guest. The chair, in the absence of Mr. John Lee, was occupied by Dr. HOGG. There were present besides, the Rev. W. Wilks, the Rev. P. H. Gale, Messrs. Shirley Hibberd, Bunyard, Walker, Jefferies, Lyert White, Arnold Moss, Northrup from Minneapolis, Minnesota, U.S.A.; J. H. Veitch, Herbert J. Veitch, Morris, Crowley, A. F. Barron, Wheeler, Herbst, Prince, Consens, Turner, &c. The health of the guest was proposed by the Chairman, and responded to in graceful terms by M. H. de Vilmorin. The toasts which were given also of the other visitors, to whom Mr. Northrup replied.

THE GARDENERS' ORPHAN FUND.—The monthly meeting of the committee took place at the Caledonian Hotel, Adelphi, on the 25th ult., Mr. GEORGE DEAL presiding. It was announced that the

LYCASTE SKINNERI VAR. *ALBA*

balance at the bank was £367 13s. 9d. The following special receipts were announced by the Secretary:—From Mr. ENGLISH, as the result of smoking concerts at the "Windsor Castle," Highborn, £5; from Mr. LEWIS CASTLE, for the part proceeds of the sale of the *Chrysanthemum Annual*, £5; from Mr. W. ROUPELL, as the proceeds of a lecture on Fruit Culture by himself at Brixton, £6; also £2 1s., from Mr. ROUPELL, as annual subscriptions collected by him; from Mr. A. PEARS, Isleworth, a donation of £5 5s.; from Mr. J. S. FOLJAMBE, Osberton Manor, Worksoop, a donation of £5; and from the recent benefit at Covent Garden Theatre, the sum of £10 10s. 6d. Communications were received from several local secretaries. At a later hour there was a meeting of the joint committee for the Floral Fete to be held in the Flower Market, Covent Garden, on May 21 next. It was announced that the Lady Mayoress had kindly consented to open the *fete*, that the tickets of admission will be 5s. each, as last year, and the number will be limited to 2000.

NATIONAL AURICULA SOCIETY.—A committee meeting will be held of the above Society, at 3 P.M., on Tuesday, April 8, at the Hotel "Windsor," Victoria Street, Westminster.

"HANDY-BOOK FOR THE YOUNG GENERAL SERVANT (Procureable from the Author, Kew Green, London, price threepence). Mrs. J. G. BAKER has published a little brochure, intended to assist both mistress and servant. Nothing is more wearisome to the former (and it must be equally so to the latter), than the repetition of directions with regard to the simplest duties to be performed in a small household, yet every new "help" needs these directions. This little book, which contains a few common-sense rules for spreading a table properly and other household duties, should be of use to the maid, and lessen the work of the "house-mother" likewise.

TORQUAY HORTICULTURAL SOCIETY.—The spring exhibition of this Society was held, as usual, in the Bath Saloons on March 27, and was very successful, being an improvement on late years. Perhaps the most noticeable features were the two groups of Orchids, staged by Mr. G. Lee, gr. to W. Lavers, Esq., and Mr. G. Wedland, gr. to Moreton Sparks, Esq., who were awarded equal 1st. Messrs. J. Sloman, J. Alder, T. Ferris, S. Hunt, H. Danverell, A. Satterly were among the chief prize-takers. Messrs. R. J. Veitch & Son, Exeter, offered prizes for Hyacinths, Mr. Ferris showing the best lot. Of nurserymen's exhibits there were several. Messrs. R. J. Veitch & Son, of Exeter, staged a fine collection of Narcissus in great variety, Cyclamens with very fine blooms, and a number of Orchids. Messrs. Curtis & Sandford, Torquay, had a display of over 100 feet of decorative flowering and foliage plants, including cut blooms of Roses. Mr. W. B. Saule had decorative foliage and flowering plants, and other nurserymen exhibiting were Messrs. Phillips & Co., Messrs. Horn & Sons, and Messrs. T. Allwood & Son.

FLORAL PHOTOGRAPHY.—The representation of floral arrangements by means of photography has derived much benefit from the introduction of what are known as the isochromatic plates. As is well known, certain colours, yellow for instance, are represented by dark spots on the ordinary photographic picture, and in this way many delicate flowers, having yellow in them, as have several Orchids and others, are falsely reproduced, and the balance of colour completely thrown out. These vagaries of the camera are due to the varying chemical powers of the different coloured rays of light. The isochromatic plates correct this to a certain extent, and so give a more truthful representation of the shades of the original. Visitors to the Crystal Palace Flower Show last Saturday might have seen a demonstration of these remarks at Messrs. EDWARDS' stand, where a graceful composition of Lily of the Valley, Daffodil, and Hyacinth, in a vase, was shown photographed by

both the methods referred to; in the case where an ordinary plate had been employed, the Daffodils were represented by very dark shadows, but when the isochromatic plate had been used, the Daffodil showed up as being slightly more shaded than the white Lily of the Valley. For landscapes, in which there is much foliage, these plates are also to be recommended.

BRIGHTON AND HOVE CHRYSANTHEMUM SOCIETY.—We are requested to announce that the date of the next exhibition of this Society has been altered from November 4 and 5 to November 11 and 12. Thus it falls on the same days as the National Chrysanthemum Society's London show, which is unfortunate; but the circumstances are unavoidable, as the building in which the show is to be held has been engaged for the whole of the previous week.

FEBRUARY WEATHER AT GRAHAMSTOWN.—Apropos of the note "Snow in the Riviera," p. 391, we insert an extract from the letter of a Grahamstown, South Africa, correspondent, dated March 1. "Old England does not stand alone in the matter of rough weather, for we have had a taste of the most inclement during the past few months. After the heavy rains, I mentioned in my last, it got rather dry again (it soon gets dry here), but it began to rain again on February 1, and has continued raining nearly every day since. On Tuesday, the 15th of February, we had a hailstorm that destroyed everything in my garden—nothing but the roots left. At the Botanic Gardens the houses are protected by wire netting, and that saved them; but the garden is wrecked for the time being, and perhaps a thousand squares of glass broken in the frames. Govie's useful and interesting nursery escaped almost entirely. You may judge of the size of the hailstones, and the force with which they fell, when I tell you that a farm-house, at the Fish River, had all the galvanized iron roof perforated with the hailstones as badly as if it had been fired on with grape-shot at a short range.

WARE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—This Society has held two meetings during the past month. One on the 11th inst., Mr. A. KING in the chair, when a paper was submitted to the meeting on "Vine Culture," by Mr. J. C. BAKER, and which evoked a capital discussion. The other meeting was on the 25th inst., the Rev. E. W. KIRKBY in the chair, when a practical paper on "Mushroom Culture" was read by Mr. E. WALLIS. Mushrooms were exhibited by Messrs. BRAY and GILLIANS. A lengthy discussion followed. The committee are more than satisfied with the progress the Society has made since its birth, but they trust that more of the gardeners and under-gardeners of the locality will attend the meetings. Information will be gladly forwarded. The Honorary Secretary is Mr. J. B. RIDING, Ware.

SHOW FIXTURES.—Richmond (Surrey), June 25; Wimbledon, July 9; Leicester, August 5; Clay Cross, August 12; and Bolton Chrysanthemum Society, November 11 and 13; Rugby, November 19 and 20. The ancient Society of York Florists' shows are announced for April 23, May 28, July 9, August 6, September 10, and a Chrysanthemum show will be held on November 19, 20 and 21.

"THE GARDEN." Messrs. PUTNAM'S SONS have published under this title a charming little volume, elegantly got up as befits the subject. It treats of "the garden as considered in literature by certain polite writers," and is pre-faced by a critical essay by WALTER HOWE. The "polite writers," from whom extracts have been made, are PENSY the elder, and the younger, LORD BACON, SIR WILLIAM TEMPLE, ADDISON, POPE, PARCELLE, LADY MARY WORTLEY MONTAGUE, THOMAS WAITLEY, OLIVER GOLDSMITH, HORACE WALPOLE, and JOHN EVELYN. It is delightful to read these essays once more, and to have them presented to us within one cover. In former times

as now, the garden was considered either from an æsthetic or a material point of view. SIR WILLIAM TEMPLE and EVELYN are severely practical; BACon does not scorn "Geniings" and Collins, but he lays it down as an axiom in the royal ordering of gardens, "that there ought to be gardens for all the months of the year, in which severally things of beauty may be then in season;" he has an eye for beauty, and does not forget the "breath of flowers" as a source of pleasure. WALPOLE'S essay in particular is specially worth reading again and again, and his sketch of the works and career of KENS should be read by all concerned in landscape art, and by all who are interested in the career of a very remarkable man. The book is so dainty, that it is hard to avoid quoting at length, but the exigencies of space preclude our doing more than recommend this very elegant production to all who are interested in polite literature.

LILIAM LONGIFLORUM FOR FORCING.—Two houses full of plants in pots of this fine white Japanese Lily are now in bloom in the Fulwell Nurseries of Mr. Wm. GORDON, of Twickenham. They were potted up as soon as imported, and brought on gradually. So managed they equal the variety of the same species, known as L. Harrisii, or the Bermuda Lily.

"BULLETIN DE L'ASSOCIATION POUR LA PROTECTION DES PLANTES."—The Presidential address read on January 29, contains a record of progress of a satisfactory character on account of the inauguration of the alpine garden on the route to the great St. Bernard, at a height of 10300 metres, and of which we have already spoken. In addition there are numerous articles interesting to the lovers of plants, will or cultivated, or both. We trust that a Society with so much power for good in promoting the knowledge of plants, and in securing them from wanton or thoughtless destruction, will receive generous encouragement.

CHISWICK GARDENERS' ASSOCIATION.—The Annual Dinner of this body took place on the evening of the 28th ult., when about forty members and friends attended. Mr. G. GORDON presided, and presented the prizes, to the value of £10 10s., which Mrs. S. A. LEE had again kindly offered, to the successful competitors. The prize-winners were Messrs. ADDISON, BARRY, BECHER, BONES, BOOKER, MILLER, SMITH, and WRIGHT.

AGRICULTURAL PRODUCE.—The statistics relating to the area under cultivation in Britain, and the yield of the principal crops for 1889, have been published by EVER & SPOTTISWOODE, West Harding Street, Fleet Street, at a cost of fourpence.

BATH AND WEST OF ENGLAND SOCIETY.—The *Journal* of the Society for 1889-90 has just been issued. Mainly it is taken up with purely agricultural matters, and with details relating to the show at Exeter. There are, however, other articles interesting to the gardener and the fruit-grower. Dr. FROEM's paper on the composition of the lay of water meadows is an excellent paper of its kind. Mr. GARLAND'S paper on Apple Culture is likewise full of excellent practical hints; whilst Sir THOMAS ACLAND'S summaries of scientific literature are valuable to those whose leisure is small, or whose capacity to grasp the details of scientific statement is small.

DR. CHARLES C. PARRY.—Horticulture, says *Orchard and Garden*, suffers another great loss in the death of this celebrated botanist and explorer who died on February 20, at his home in Davenport, Iowa, from pneumonia, at the age of sixty-six years. Dr. PARRY is not known to horticulturists as an author, indeed he published very little, but his real work was as an explorer, and in that capacity he has discovered hundreds of new plants, afterwards described by GRAY and ENGELMANN. Among the better known of them may be mentioned: *Picea pungens*, P.

Engelmanni, Pinus Torreyana, P. aristata, P. Parryana, &c. His life work as a botanical explorer has been rich in its results, and he has given freely to the world the rich treasures he has discovered.

"THE AMERICAN GARDEN."—This monthly periodical is well edited and well got up. The matter is varied and interesting. We notice that some of the American growers are open to the same charge of slip-shod packing for market as our own people; and that, as with us, the salesman on the other side of the Atlantic has to bear some at least of the blame which properly belongs to the producer himself.

LANDSCAPE GARDENING.—In the last number of *Garden and Forest*, a list is given of all the principal works on landscape gardening that have been published, beginning with FRANCIS BACON in 1625, and ending with WALTER HOWE in 1890, the latter writer, by a coincidence, repeating BACON'S Essay. The article, "The English Flower Garden," attributed to an anonymous writer, was written by the late H. A. BRIGHT, whose "Year in a Lancashire Garden," published in these columns, has had so many successors and imitators.

"THOMSON ON THE VINE."—The tenth edition (Blackwood & Sons) of a book tells its own tale, and might be thought to serve as an excuse for an author not revising so successful a treatise, or as exonerating the critic from any notice of a work so well known and so deservedly appreciated. Nevertheless, such popularity imposes upon the author the duty of maintaining his well-earned reputation, and hence we trust that the eleventh edition may experience some further revision in the nomenclature and choice of varieties, and in the physiological explanations offered of growth and of diseased conditions. Some further account of the remarkable success at Clovenfords would also be desirable. In the matter of soils Mr. THOMSON'S remarks are worthy of careful perusal, and form perhaps the most valuable part of his book, though not many of his readers can hope to have access to the Deer Park, which he recommends. Failing this, THOMSON'S Vine manure is recommended in the body of the work in a manner rather too suggestive of the notices of a patent medicine. This is the more unfortunate, as tending to lessen confidence in a manure that is excellent in its way, and which is highly spoken of by numbers who have tried it. As a practical treatise, though not so complete as some more recent books, it may be strongly recommended.

PASTURES, TEMPORARY AND PERMANENT.—Dr. FARAM has prepared a very useful summary of the experiments conducted by Mr. MARTIN J. SUTTON at Kidmore, near Reading, with a view to determine the value, from a practical point of view, of certain manures when applied to grass land. The general results agree with those obtained at Rothamsted, but there are points of difference in detail owing to the character of the soil. Nitrate of soda proved to be deleterious to pastures. The difference between pasture and meadow (hay field) is appropriately insisted on, for the vegetation differs materially, and the action of manures also. The present series of experiments is terminated, owing to the removal of Mr. SUTTON to a larger holding in the same parish, where there is greater scope for agricultural experiments of all kinds.

PROCESSES OF REMOVING INSECTS FROM PLANTS.—A novel process, by EDWIN P. FOWLER, of National City, California, consists in dislodging the vermin and mealy-bug by means of a sand-blast, which destroy yearly entire groves of Lemon and Orange trees in Florida, South California, and other tropical States. In carrying out the invention, a fan blower of any suitable construction, or any other apparatus capable of creating an artificial current of air, is employed. The artificial current of air thus created is directed against the tree or other plant, and in its transit from the fan blower

to the plant, the current of air is charged with sand. Of course the force of the artificial air current must be carefully gauged, so that the sand which is projected by the same against the trees or plants will not destroy the plants together with the vermin or scale, and the sand must be sifted, so that no coarse particles or stones remain mixed with it. If the force of the air current is properly limited, according to the nature of the plants under treatment, the scale or vermin can be removed without injuring the trees or plants. In some cases it is desirable that the artificial current of air shall be heated, and for this purpose there is combined with the fan blower or other apparatus a suitable heater. It may also be desirable in certain contingencies that the sand which is used for charging the artificial air current shall be hot, and for the purpose of heating the sand before introducing it into the air current, any suitable heating apparatus may be used. *British Mail*.

THE METEOROLOGICAL STATIONS IN THE NORTH OF SCOTLAND.—The Council of the Scottish Meteorological Society, in their report, submitted at their annual meeting on Monday, March 31, state that a station has been founded at Boyndie, Banffshire. The observer, the Rev. WILLIAM ANDERSON, has furnished the instruments. A number of stations have been inspected during the year. Weekly observations of temperature, rainfall, and sunshine were forwarded regularly to the Meteorological Council of London, from the Society's stations at Glencarron, Lairg, Fort Augustus, Braemar, Glenlee, Ochterlyne, and Marchmont. Ben Nevis and Fort-William observations have been prepared and brought down to date. In a week or two the buildings of the low level observatory will be completed, and immediately thereafter the Council will erect the self-registering instruments, which were originally at Armagh, and otherwise supply a complete set of instruments for a first-class meteorological observatory. The directorate of Ben Nevis observatory expect soon to be in a position to put scientific men in possession of two sets of hourly observations of the most complete description, one from the summit, and the other from the foot of the mountain. By these observations the changes in the condition of the weather may be followed, particularly those great changes so essential to the advancement of knowledge of the approach of storms.

BIOGRAPHICAL INDEX OF BRITISH AND IRISH BOTANISTS.—From the list of these published in the *Journal of Botany* for March, we extract the following:—

"NELL, PATRICK (1776—1851): b. Edinburgh, 1776; d. Canonmills, Edinburgh, September 3, 1851; bur. Warriston Cemetery, Edinburgh. LL.D., Edinb. A.L.S. 1807. F.L.S. 1813. F.R.S. Ed. First Vice-Pres. Bot. Soc., Ed., 1836. Printer-Correspondent of Cuvier. Article, 'Faci,' in Edinb. Encyclop. Friend of George Don. Collected Scotch plants. Secretary, Wernerian Society. Gard. Chron., 1851, 567, 663; Cott. Gard., vii., 121; Greville, 'Alge Brit.', iv.; Proc. Linn. Soc. ii., 191; Banksian Corresp., xii. (Mar. 12, 1801). *Nellia* D. Don.

"NEISON, DAVID (d. 1789): d. Timor, July 20, 1789. Kew gardener. Assistant on Cook's third voyage, 1776—1780. On H.M.S. 'Bounty,' 1787. Australian, Cape, and Timor plants, in Herb. Mus. Brit. Fl. Tasmania, cxlii.; Gard. Chron., 1881, ii., 267; Brown, Prodr., 481. *Nevonia*, Br.

"NIVEN, JAMES (1774?—1826): b. Penicuik, Edinburgh, 1774?; d. same place, January 9, 1826. Grandfather of the following. Gardener in Edinb. Bot. Gard., at Syon, 1795, to Hibbert, 1798. Collected in S. Africa for Hilbert, 1798—1803; and again for Lee and others, 1803—1812. Gard. Mag., ii., 255; Bot. Rep., t. 193; Trans. Linn. Soc., x., 46, 134; Lasègue, 447; Trans. Hort. Soc., i. 262. Plants in Herb. Mus. Brit. *Nivenia* Br. = *Paranonus* Salisb.

"NIVEN, JAMES CRAIG (1828—1881): b. Dublin, 1828; d. Hull, October 16, 1881. Son of the fol-

lowing. Asst. Curator at Kew, 1852. Curator, Hull Bot. Gard., 1853. Lectured on Bot. at Hull. 'Cat. Herbaceous Plants at Kew,' 1853. Edited Maund's 'Bot. Garden,' 1878. Jacks., 412; Journ. Bot., 1881, 335; Gard. Chron., 1881, ii., p. 541, with portr. on p. 589; Life and portr., 'Garden,' xx. (1881).

"NIVEN, NINIAN (1759—1870): b. 1759; d. Dublin, February 18, 1879. F.B.S. Ed., 1836. Curator, Glasnevin Bot. Gard., Dublin, 1834—1838. 'Companion to the Bot. Gard., Glasnevin, 1838. Pritz., 233; Jacks., 411; Gard. Chron. (1879), xi., 277; R. S. C. iv., 627.

"NOEHDEN, GEORGE HENRY (1770—1826): b. Gottingen, Jan. 23, 1770; d. London, March 14, 1826. LL.D., 1796. F.L.S., 1800. Vice-Secretary, Hort. Soc. Librarian, Brit. Mus., 1820. Contrib. to Eng. Bot., 738, 858. 'Varieties of Citrus,' Trans. Hort. Soc. III. Appx. R. S. C. iv., 631; Rose; Hofer.

"NORTH, RICHARD (d. 1739). Nurseryman, of Lambeth. 'Treatise on Grasses' and 'Gardeners' Catalogue,' 1759. Johnson, Hist. Gard., 215; Pritz. ed. i., 213.

"NUTTALL, THOMAS (1786—1859): b. Long Preston, Settle, Yorksh., Jan. 5, 1786; d. St. Helens, Lanc., Sept. 10, 1859. Printer, F.L.S., 1813. Emigrated to Philadelphia, 1807; Upper Missouri, 1811; Arkansas, 1818; Snake River, 1834; Sandwich Isles and Monterey, 1836. Prof. Bot., Harvard, 1834. Returned to England, 1842. 'Genera of N. American Pl.,' 1818. Study-set bought by Brit. Mus.; sets also at Kew, Harvard, and Philadelphia. Pritz. 235; Jacks., 487; R. S. C. iv., 630; Whittle, 'Blackburn as it is,' 1853, 194; Cott. Gard., xxiii., 7, 349; Proc. Linn. Soc., 1860, xxvi.; Journ. Bot., 1841, 108. *Nuttalla*, Torr. & Gray.

"OLDHAM, RICHARD (1837—1864): b. 1837; d. bur. Amoy, Nov. 13, 1864. Botanical collector in Eastern Asia. Plants at Kew. Brit. Mus., &c. Journ. Linn. Soc., ix., 163; Journ. Bot., 1866, 239. *Desmodium Oldhami*, Oliv.

BOOK NOTICE.

HISTORY OF BOTANY (1630—1860). By Julius von Sachs, authorised translation by H. E. F. Garnsey, M.A., revised by Isaac Bayley Balfour, Oxford. Clarendon Press.

This is a very pleasantly written treatise on the history of Botany, showing how the great principles of the science have been gradually evolved, and whose were the master minds concerned in the process. Those who desire to know what are the great principles, apart from the overwhelming mass of detail by which workers are necessarily encumbered, and with which the ordinary text-books are overburdened, may turn to these pages and be sure that, with certain important exceptions, they may obtain from them a general view otherwise most difficult to obtain. Some portions, however, are treated more fully than others. Classification, in the modern sense of the word, hardly receives sufficient attention, and the English reader will be no little astonished to find that neither of the Hookers, nor Berkeley, nor Bentham, nor Aaa Gray, receive even casual mention. Dean Herbert, however, we are glad to find, receives recognition as a hybridist.

Among Frenchmen A. de St. Hilaire, Moquin Tandon, Dunal, the two Richards, and others, are similarly not mentioned. Heer and Humboldt are in like case, which is tantamount to saying that neither geology nor botanical geography find a place in Professor Sachs' pages. The omissions we have alluded to are hardly to be explained by the author's principle of selection, which was to "single out as the true heroes of our story [those men] who not only established new facts, but gave birth to fruitful thoughts, and made a speculative use of empirical material."

But withal, the book is a valuable contribution to the literature of botany, and the Clarendon Press has done good service in publishing it. The translation is well done, and the work is produced with the care and neatness characteristic of the Oxford Press.

PLANT NOTES.

PEPEROMIA RESEDFLORA.

As its specific name implies, the flower resembles somewhat those of the Mignonette, departing from the majority of plants comprising this large genus, which are more generally valued horticulturally for their foliage than flowers. The latter are white, produced on erect pyramidal terminal panicles; the leaves small, entire, of a dark green colour. At the time of flowering, the plants attain a foot or 18 inches in height, and flowers useful for cutting. They are of easy growth, and any piece of the stem with a node attached, as well as the leaves, may be used for propagation. Pans are suitable in which to grow Peperomias, and a compost of loam, leaf-mould, and sand.

AMORPHOPHALLUS RIVERSII.

These plants will hardly ever become general favourites unless it be their foliage which recommends them; for who can admire a flower while emitting a most noisome odour. The same kind of cultivation as that which is applied to the Caladiums is suitable for Amorphophallus, keeping them warm during the period of rest, or rotting may occur. Water at the roots or bulbs is not of so much consequence as keeping them in a warm temperature.

The scape appears before the leaves, and upon showing signs of growth, which will be during the beginning of the year, they should be repotted into good fibrous loam, leaf-soil, and sand, giving very little, if any water until they commence to make leaf-growth. The scape is thicker and speckled, the spathe rising in a tapering manner out of the spathe, being of reddish-brown colour. They attain a yard or more in height, which depends upon the age and strength of the bulb. The leaves are solitary, decomposed, and spreading 3 or 4 feet or more in diameter, with marbled petioles. It is a native of Cochinchina. The plant is effective for sub-tropical gardening. Some fine examples have been in flower in one of the houses here lately.

ALPINA MUTICA.

This plant requires a large house and much warmth. It has recently been flowering freely in the palm house of the Cambridge Botanic Gardens. The flowers are produced in terminal, drooping racemes, on the stems, which are of about annual duration; the buds are glossy, the lip of which is of a rosy hue; the large lower lip is yellow and crimson in colour, and resembles the feathers of a peacock in its venation. To have these plants in full beauty, they should be grown either in large pots or tubs, so as to get a good mass of its canna-like stems; and when the new growths have advanced somewhat, the old flowering growths may be cut away and re-potted attended to, if the rhizomes have become thickly crowded. It is a good plan to divide them into halves with a spade, reversing the pieces so that the outside may occupy the inside or centre of the pot or tub, and employing as potting compost good fibrous loam, two-third peat and leaf mould, with a liberal addition of sand. When in full growth the plant can scarcely be overwatered, and it is benefited with an occasional application of liquid manure or dry artificial manure applied to the surface of the soil. Introduced from Horno, 1882.

A. ALBO-LINEATA.

Is a dwarfier growing species from New Guinea.

A. NUTANS.

A very tall growing species is suitable for planting out-of-doors in well drained positions.

A. VITTATA.

Is a very pretty variegated form, introduced from the South Sea Islands. *W. Harrow, Botanic Garden, Cambridge.*

JACARANDA MINOSIFOLIA.

The foliage of the above is graceful and good to use in large vases in the place of Fern fronds,

Though not so hardy as Grevillea, it can be properly made use of when flower vases are required for a short time only, such as in dinner table decoration, or the like. When used for long periods, the plants should be placed in a cool temperature after their growth is finished. Propagation is by cuttings, a few inches long, taken off with a heel and placed in sandy compost in heat. Young plants themselves are good subjects for decorative work, their light graceful foliage being always telling. *G. Wythes, Syon Gardens.*

BEGONIA MANICATA.

This fine old species of Begonias is invaluable for enlivening the stove at this period of the year; and its graceful panicles of rosy flowers are equal in beauty to many Orchids. A few plants of it should be found in every garden having a stove. Not that it is essentially a stove plant; as it succeeds perfectly in a lower temperature, and with very simple treatment during the greater part of the year. I have one specimen in bloom just now, in a 9-inch pot, that is 3 feet in height, and which is carrying twenty-seven panicles of flowers, its large and characteristic foliage reaching down to the bottom of, and concealing the pot. As soon as it has flowered, any growths which may have taken the lead are cut back, to give the plant a balanced head, and the plant removed to the lateinery, when growth soon commences. It is then re-potted if that be required, but over potting is avoided, the soil consisting of good loam, plenty of leaf-mould, with a liberal addition of sand. During the summer months it is removed to a cold unshaded frame, and abundance of air is afforded it to ripen the new growths, weak manure-water being afforded occasionally. The foliage must not be wetted when the sun is powerful, or scalding will ensue. In autumn it is removed to the greenhouse and watered sparingly, until it shows for bloom, when it is removed to the stove; for if allowed to remain in a low temperature at this stage, the buds fall prematurely. The tops which were taken off after flowering, make, when struck, nice little plants for dinner-table decoration. But as this variety in common with others of the Rex type has a tendency to grow with the foliage on one side, or with "a face," two cuttings should be inserted in one pot, which will quickly root if placed in bottom-heat, being afterwards treated like the larger ones; they will bear two or more panicles each, and be very effective. *W. H. Stephens, Prescott House, Stourbridge.*

CARRON HOUSE.

This ancient seat in Stirlingshire, now so favourably known for the fine gardens and extensive grounds which have of late years been formed, was a place of some note more than half a century ago, but for many years it remained in a state of decay, almost ceasing to represent any of the features of a county residence.

The roofless old mansion mantled with Ivy, gives indication of grandeur long past, and might now be turned into an object of interest for the growth of Ferns and rock plants. The fine shelter given to the grounds by the gigantic trees of Beech, Willows, Planes, Birch, and Oaks, show that in the first planning of the place, the work had been done with consummate care, and this has doubtless been perceived by the present spirited proprietor, T. D. Brodie, Esq., of Gairloch and Idvies, whose refined taste and liberality have prompted him to restore this fine old property to its former beauty and usefulness. For this purpose, the services of Mr. M. Temple were secured about seven years ago, and he has performed his duties with marked energy and skill, working a complete transformation in the whole scene. Old and useless orchards, decaying shrubs, &c., have been swept away, and in their stead extensive lawns beautifully kept have been formed; large breadths of choice shrubs, Conifers, and other trees extensively planted in the garden and park, and always in desirable

positions, securing embellishment and shelter, whilst every view and desirable object in the landscape has been taken advantage of. Roads, drives, and walks have been renovated, and other service-walks are being formed, but in every case these are concealed from view as much as circumstances will allow. Passing to the gardens, of which little that is old remains—with the exception of some fruit trees which have been reduced in size and replanted or root pruned—their appearance has been completely changed. We noticed in passing through a reserve garden, numbers of plants in pots, arranged in order for decorative purposes, and for supplying cut flowers during the winter. These consisted of Deutzias, Cytisus, Rhododendrons, Sparmannia africana, Roses, Acacias, Spiræas, and others, all of them healthy and vigorous. In low glass-houses and pits were numbers of Epacris, Ericas, Camellias, Daphnes, and other greenhouse plants.

Azaleas, to give flower from November to June, were healthy, and consisted of well-formed plants, of from 2 feet to 5 feet in height. The principal range of span-roofed plant-houses is 300 feet in length, substantially built, conveniently arranged, and handsome in appearance. A broad gravel-walk is in front, and some hundreds, mostly in 12-inch pots, of vigorous Chrysanthemums growing, ran the whole length of this range. A show-house was entered that was 45 feet long and 24 feet wide, lofty, and of octagon form. This house was filled with Hydrangeas, Calceolarias, Pelargoniums, especially of the French decorative class; double Petunias, Lilium Harrisii, and *L. auratum*, in fine form; Fuchsias, Dracenas, Lapaigeria rosea, and *L. alba*, and many others, with a band of Harrison's Musk running along each side of the path, which runs down the centre of the house. The rafters are well clothed with *Cobaea scandens variegata*, planted at equal distances apart; Roses, Lapageries, Clematis in variety, all falling thickly, and yet gracefully, and affording slight shade to the plants beneath. A large rain-water tank lies under the floor, which is an arrangement that is carried out all along the divisions of this range. A cool orchid-house adjoins, which is arranged on the most modern principle, and filled with a vigorous collection of *Odontoglossums*, *Cypripediums*, *Coleogynes*, &c. Some fine spikes of *Odontoglossum Alexandræ* were in flower, and others were throwing up 4-5-6-7 spikes. Ferns, small Palms, *Lycopodiums* and other interesting plants, were interspersed amongst the Orchids, and gave clothed appearance to the whole. The next house entered was a stove for flowering plants, which were in fine order. Gardenias, Stephanotis, Tabernanontana, Anthuriums, Begonias (of the finer sorts), Cliveas, and Pancratiums. Lines of fine Gloxinias were a mass of flower, and consisted of almost every shade of colour. From this house a stove was entered, in which fine foliage plants were grown. There were finely coloured *Crotons*, *Dracenas*, *Pandanus Veitchii*, *Cyperus*, &c., all thoroughly clean and vigorous. These are a class of plants much in request by the family during the winter months, and the proprietor derives special pleasure in aiding his neighbours (who cannot command the use of stoves) to decorate their halls and churches, and other places, thus rendering it necessary for the gardener to have plenty of such plants.

An Orchid-house contained a collection of choice *Dendrobium nobile*, *Warthaumii*, *Devonianum*, &c., which had made good growth last season. *Catleyas* and *Calanthes* are also largely grown. The next house we entered was one set apart for Begonias, Pelargoniums, and Coleus, which was at the time of our visit the most brilliant in the whole range. The last division of the range is a structure similar in form to the one at west end, and is called the Camellia and Orange-house. The Camellias, of pyramidal form, were well studded with flower-buds, and in fine healthy condition, and of an average height of 7 feet. Standard Orange trees with clean straight stems were about 8 feet in height. There were fine healthy Palms mixed among the Camellias to add to

the effect, also variegated Phormium, Tree Ferns, Cordylines, Heaths in variety, and dense masses of *Hydrangea paniculata grandiflora*. This range of glass bounds the kitchen garden on the south. A range of fruit houses forms the northern boundary of this garden, and is about the same length as the plant range. The divisions of the range are 17 feet in height and 18 feet wide, and are three-quarter spans. Judging from the excellent crops of Grapes and Peaches produced every season, it would appear that they are thoroughly adapted for fruit growing. Black Hamburg, Muscat, Hamburg, and Duke of Buccleuch, with bunches of from 2 lb. to 5 lb. weight, large in berry, were being cut. Later houses were filled with Muscats (black and white), and others; the bunches of the two kinds named averaged from 2 lb. to 5 lb. Lady Downes and Gros Colmar were also very fine. In the Peach and Nectarine houses the fruits were of great merit; the trees are faultlessly trained, and in good health. In another house for giving late supplies of Peaches, there were fine crops of Barrington, Sea Eagle, Violette Blavie. The pineries consist of four divisions, and in these were numbers of first-rate Queens, swelling and ripening. In these houses on the back shelves were great quantities of Melons, Blenheim Hybrid and Beechwood being among the best. Ranges of sheds, Mushroom-house, fruit-houses, &c., have been built on the most approved principles.

Passing under a number of fine old Thorn trees, the excellence of the crops in the kitchen garden was noted, and which Mr. Temple stated were about the best he had ever had. The walls are covered with finely trained trees, all forms being represented, but fan-training is held in the highest favour. We passed outward through a very pretty flower garden, formed a few years ago, which was remarkably gay. At the further end of this garden two lines of terraces have been formed, and fine specimens of Golden Hollies, Cupressus, Retinosporas, and Rhododendrons planted at the back to mask old buildings, a job which has been very well accomplished. Long lines of Roses and herbaceous plants are tended with the same care as every kind of plant grown. Much is yet to be undertaken in extending, and improving, this fine old place. *John Downie*.

TRUFFLES—TRUE AND FALSE.

AN erroneous idea is very prevalent that Truffles are rare, and that there is only one kind of Truffle; another but more correct idea is, that Continental Truffles are far better than British examples. The fact is, one native species only, and that a comparatively inferior one, is usually consumed in Britain, whilst upon the Continent several species of various degrees of gastronomic merit are prepared for the table. It is true that our British species, named *Tuber aestivum*, is sold in continental markets with other Truffles, but it is held in poor esteem as compared with better varieties. The different species of Truffle are not always equally common, so that sometimes inferior species are used upon the Continent because the choicer varieties cannot be procured. It is, indeed, possible to preserve the different species for several years, but at times the stock of the best varieties will run short. In periods of great scarcity, fungi that are not Truffles at all are used for stuffing turkeys, &c. The best makers of "Perigord pie," or *pâté de foie gras*, are very particular as to the *Truffle* they use, but the inferior makers are much less particular. The black pieces of Truffle as seen in stuffed fowls *poulard truffé*, Perigord pie, &c., are considerably alike in general appearance; but a resort to the microscope generally shows what species of Truffle has been used, or whether the black masses are fragments of Truffles at all. It is a notable fact that the spores of Truffles are not altered in form or marking in the process of cooking.

The late Mr. C. E. Broome, F.L.S., of Bathaston, was a great collector of, and authority upon Truffles of all kinds, and for a great number of years in

succession I accompanied Mr. Broome in his mycological rambles; we were each provided with short-handled rake, a garden trowel, and vasculum or basket. As a beginner, I thought Truffle finding must be very difficult, the fungi being to a great extent subterranean, but after a few excursions with Mr. Broome, I soon found many of the difficulties re-

which the spores (or sporidia) are borne within the substance of the Truffle in small transparent *asci*, bladders, sacs, or bags. These different methods of spore growth are shown in the accompanying illustrations.

The chief Truffles of European markets belong to the family Ascomycetes, and to the order Tuberales, and to this order the first references will be made. There are various genera belonging to the order, and the most important genus is *Tuber*. All the species, in all the genera are (or should be) subterranean or partially so. The British Truffle, *Tuber aestivum* (fig. 63), is well known, and much more common than is generally supposed. It is a northern species, and is usually about the size shown in the illustration, often half as large again or nearly twice the size, whilst sometimes a single example may weigh nearly 2 lb. It is stated in the *Gardeners' Chronicle* for 1871, p. 1044, that Truffles sometimes weigh 3 or 4 lb. each, and measure a foot round. *T. aestivum* is black and polygonally warted outside, and beautifully mottled with white and yellowish-brown inside—see section n, fig. 63. It may be found in perfection as early as July, whilst its period of maturity lasts well into the late autumn. It grows in copses, hedgerows, and open places in plantations gregariously with other species of *Tuber*, and generally prefers plantations of Beech, Oak, or Birch (rarely Pine), on argillaceous or calcareous soil. The odour of *T. aestivum* is exceedingly potent, and to some persons very agreeable. The odour is easily detected in plantations where Truffles grow, the scent attracts certain flies, popularly termed "Truffle flies;" but the flies are probably not peculiar to the Truffle, although some writers have asserted that flies "cause" Truffles. In England till lately this species of Truffle was sold at 2s. and 3s. (rarely 3s.) per pound, but of recent years it seldom appears in the markets. The trade of Truffle-finding is said to have been ruined in this country by the taxation of the Truffle-dogs. In past times Truffle-finders in England employed trained mongrel terrier dogs to "point" localities for Truffles by scent. The French use a kind of French poodle. Squirrels also find it by scent, and scratch out and eat it. Rats and mice, and pigs are also exceedingly fond of it, and some dogs will eat it. This Truffle is frequently seen half exposed above-ground, at other times it is met with some 3 or 4 inches beneath the surface, never deeper as far as my experience goes, although it is said to be sometimes found a foot or two deep. I have seen in some places calcareous ground rough and broken up by the growth of these fungi, many of the examples being half exposed. *Tuber aestivum* is often badly attacked by a microscopic fungus belonging to the genus *Pythium*. A beetle, named the Truffle beetle, *Anisotoma cinnamomea*, with its larva, is described and illustrated by Professor Westwood in the *Gardeners' Chronicle* for February 21, 1885, p. 248; this beetle is not uncommon (fig. 66, p. 429). *Tuber aestivum* is best used when mixed with other materials in stuffing; it gives a strong and peculiar flavour, but the individual particles of Truffle always remain hard, and are no doubt very indigestible. Some persons greatly relish the water in which chopped-up Truffles have been boiled.

Our illustration (fig. 63) shows *Tuber aestivum* the natural size at A, with section, n. The spores are borne generally in fours, in minute transparent *asci*, or bags, as shown at c, enlarged 200 diameters, the yellowish-brown honeycombed spores are interesting objects for the microscope; one is shown at d, enlarged 500 diameters.

The true French Truffle is *Tuber melanosporum* (fig. 64). The species, however, grows in Italy and other places in Europe, and probably in Britain, although, as far as I know, it has not yet been recorded. In France and Italy this fungus grows gregariously with the last, and with *T. brumale*, a British species; the latter is sometimes confounded with the plant now before us. *T. melanosporum* is a winter species, found from

FIG. 63.—BRITISH TRUFFLE—*TUBER AESTIVUM*.

moved. Whilst going through plantations, Mr. Broome would suddenly stop and say, "This looks exactly like a place for *Tuber macrosporum*," or, "We ought to find *Tuber rufum* here," and so on. Probable Truffle localities were known to Mr. Broome by the nature and condition of the soil, and by the presence of certain trees. On using the rake and trowel, the species sought for would be more often found than not, and the mycelium in the earth would show in which direction other examples should be looked for. When found the odour, or mere external

FIG. 64.—FRENCH TRUFFLE—*TUBER MELANOSPORUM*.

appearance, was often sufficient for naming the species. If the Truffles did not happen to be found, Mr. Broome would say, "Ah, you come here in December" (or July, as the case might be), "and I believe you will find them."

Truffles, in a popular sense, belong to two great families of fungi, one the Gasteromycetes (to which Puff-balls, &c., belong), and in which the spores are naked, *i.e.*, borne on simple spicules, or supports, within the substance of the Puff-ball, or Truffle. In the other instance, to the family Ascomycetes, in

October to January, usually in plantations of Beech or Oak; it is globose, bright brown or black in colour, and covered with rufescent black, obscurely polygonal warts, *a*; the interior, *n*, is at first dirty-white, then blackish-grey, and violet-black, or dark reddish, marbled with white. The brown spores are borne in groups of from one to six in colourless bags or *asci*, as shown enlarged 200 diameters at *c*. Each spore, as may be seen at *b*, enlarged 500 diameters, is covered with minute tubercular projections. When a single spore only occurs in an *ascus*, it is usually a very large one; when six occur, they are usually small. This Truffle, although a winter species, is often found in July and August growing with *T. aestivum*, but it is then manifestly immature. It is not ripe till December, when it is fully coloured, and possesses a strong Strawberry odour. After gathering, the odour greatly increases in potency and sharpness, and in the process of drying for the herbarium the scent becomes almost unbearable, but never entirely unpleasant. This is the Truffle used in the best *pâté de foie gras* and *poulard truffé*, and an examination of these preparations with the microscope will soon show whether the true Truffle has been used or not, as the spores are distinct in shape. The approved method of preparing Truffled turkey on the Continent is to pluck the bird directly it is killed, and whilst still warm to entreaty stuff it with Truffles; the turkey is then hung till in a fit state for cooking. Sometimes Chestnuts are mixed with the Truffles, and some epicures say this mixture gives a better flavour to the turkey than Truffles alone. Sometimes the French Truffle is, after cleaning, simply plunged into boiling water, and quickly boiled for a short time. It is then eaten hot, or cut up and eaten with oil. The entire Truffle trade of France is said to be worth, to the original producers, £400,000. In *Tuber melanosporum*, as in all other Truffles, it is common to see spores in the process of germination whilst still within the parent Truffle; three germinating spores are shown at *d*. This Truffle sometimes sells for 15 francs per pound in France and Italy.

Tuber brumale is an autumn and winter Truffle, and a British species. In Britain it is generally much smaller than the two last, its average size being about that of a hazel nut, black, and polygonally warted outside; and ash-black, marbled with a few white veins inside. It sometimes grows 2 or 3 inches beneath the ground surface, but I have seen it in abundance entirely superficial under Cedars. The odour is very strong, like the wood of *Cornus sanguinea*, according to Vittadini. This Truffle generally grows under Oaks and Abele in grassy places, and is mature in October, November, and December; it is said to be a good edible species, with an agreeable taste. It is often used in *pâté de foie gras*, where it is somewhat difficult to distinguish from *T. melanosporum*, as the spores, though not identical, are somewhat similar both in size, colour, form, and echination. This species is said to be more highly esteemed in France than *T. aestivum*. Personally, I disapprove of *T. brumale* for the table.

The Italian Truffle is *Tuber magnatum* (fig. 65); this has not been recorded as a British species. It is an autumn or early winter Truffle, and does not usually grow in a gregarious manner as in the three species already described, but generally in isolated examples.

Externally, *T. magnatum* is smoothish, or very slightly rough or papillose, often lobed and cracked, and pallid-ochreous—sometimes shaded with reddish or greenish in colour. The flesh is at first white, then brownish or blackish-red, marbled with yellow veins, *n*. The *asci* and spores somewhat resemble those of the English Truffle, but the yellowish spores are smaller and are borne from one to four in each *ascus*. *T. magnatum* grows in clayey soils, in plantations or open fields, under Willows, Poplars, and Oaks. As in many other Truffles, the odour of this plant is most potent; it has been compared with decaying cheese and Onions, or Garlic. This Truffle is very different from those already described in its colour, in its almost smooth external

surface, and in its Garlic odour. It is sold in Italian markets for about 4 francs per pound.

The following notes of the habits of the other British species of *Tuberacei* as observed in this country have not, as far as I know, been hitherto published:—

Tuber macrosporum.—In clayey places under Oaks and Beeches, rarely Willows and Poplars. Sometimes rather near the surface, at other times deep underground.

T. bituminatum. B. & Br. (this is the *T. mesen-*

FIG. 65.—ITALIAN TRUFFLE—*TUBER MAGNATUM*.

tericum of Vittadini).—In sandy ground, calcareous soils and calcareous clays, deep beneath the surface.

T. scleroneurum, B. & Br. (this is the *T. rufum* of Vittadini).—Like the last, deep in sand or sandy ground.

T. excavatum.—Generally quite superficial, under dead leaves. Not edible.

T. brumale.—Commonly 2 or 3 inches deep. When under Cedars quite superficial.

FIG. 66.—TRUFFLE BEETLE.

T. rufum.—Two or 3 inches deep.

T. nitidum. Vitt. This is merely the young condition of the last. Habitat the same.

T. puberulum.—In loose sand or leaf-mould, 2 or 3 inches deep.

T. dryophilum.—Same as last.

T. maculatum.—Loose leaf-mould, 3 or 4 inches deep.

Pachyphloeus melanoxanthus, Tul.—In loose soil and leaf-mould, 2 or 3 inches deep.

P. citrinus.—Same as last.

P. conglomeratus.—Superficial, on dead sticks under leaves, &c.

Stevensia bombycina.—On lawns, &c., almost superficial, sometimes an inch or two deep.

Hydnotria Tulasii.—Generally 6 or 8 inches deep in sand.

Hydnobolites cerebriformis.—Superficial, under dead leaves.

Sphaerosoma ostiolatum.—Same as last.

Balsamia platyspora.—Almost superficial, but immersed in fallen Fir leaves.

B. vulgaris.—Same as last.

B. fragiformis.—Superficial, covered with dead leaves.

Gaele verrucosa.—Same as last.

G. Klotschii.—Same as last.

G. bispidula.—Sometimes superficial, often just beneath the surface, involved in grass roots.

Elaphomyces.—Four or 5 inches beneath the soil.

Endogene.—These fungi, doubtfully belonging to the *Tuberacei*, occur near the surface, but sometimes 3 or 4 inches below it. *Worthington G. Smith, Dunstable.*

(To be continued.)

DOUBLE DAFFODILS FROM SEED.

IN 1884 we were just entering upon the Daffodil campaign which has led to such good results. Our knowledge of Daffodils was then hazy, and there were many matters in doubt at that time which have since been cleared up. Amongst these was the origin of the double Daffodil. Our valued friend, Mr. Wolley Dod, was busy with his investigations to prove that singles could not become double by cultivation—a theory which then had general acceptance; and he was beset with assertions that singles had become doubles in all quarters. He conclusively proved that all these were not facts, and up to the present time I believe that no single instance of a single becoming a double Daffodil has been proved.

Mr. Barr had sent him double Daffodils which had come from the banks of the Arno in Tuscany, and he went so far as to suggest that they might have been introduced from England. (*Gardeners' Chronicle*, March 1, 1884, p. 272.)

To this I replied the following week (p. 309):— "Is it possible that these double Daffodils have been introduced from England. It is certainly possible, but it is improbable. I gave it as my opinion that doubles come as seedlings, and may happen any year from a single form, and that in such a simple flower as a Daffodil the double would always be similar wherever they arose; that principles would produce the bicolor mixture of petals; and obvallaris, the self yellow doubles, and so forth." I then went on to say:—"Is it possible that the double Daffodil is a species, having the power of perpetuating its quality by seeds? To this paragraph the Editor put a [?]. This query led me to investigate the question carefully, and to endeavour to prove the truth of my theory. This proof was forthcoming shortly afterwards at the Daffodil Conference, and the Linnean Society. I was able to show that the popular idea that a double Daffodil had no stamens and pistils, was erroneous—and I produced flowers in every stage of doubling, and with the ovaries containing seeds. Up to that time even experienced growers, such as Mr. Krelage and Mr. Barr, had never seen ripe seed from a double Daffodil. The Editor of the *Gardeners' Chronicle* also stated, p. 587, that he had never seen seeds, although he had examined a large number of double flowers with ovaries.

On June 21, the same year, I gathered a ripe batch of seed from a double flower, and on November 22, I reported that the seeds had produced plants. Since that time I have frequently observed the same seedling, and I believe a good many others have a like experience. We have here a bed of seedlings all from doubles—and on looking over it to-day I find there are three flowers all doubles. This, therefore, completes the proof, as we have double flowers from seed gathered from a double flower. *W. Brockbank, Brockhurst, Ditchbury, March 30.*

HOME CORRESPONDENCE.

HOME-GROWN LILY OF THE VALLEY.—There can be no doubt that, if we were to confine ourselves to forcing such examples of Lily of the Valley as are commonly found in old-established gardens and in our woods, as we used to do in our early days, the robust crowns of Continental growth would leave us very far behind; therefore, those who wish to grow their own Lily of the Valley roots for forcing, should cultivate one or other of the Continental types. Our entire stock is the produce of a few imported clumps of the Berlin variety; even for out-of-door beds this kind is far superior to the common kinds of our gardens. As for some years Lily of the Valley has been here in constant request from early December until the finishing of the out-of-door supply, we have, therefore, had to pay considerable attention to its regular production. Our system has been to make new plantations every year, and to allow these to stand two or three years before lifting the roots for forcing, the three-year-old beds being mostly best. Lifting the roots generally commences early in November, and for forcing up to March; we always use single crowns, sufficient roots being lifted at one time to afford two or three batches of crowns. Before separating the clumps they are allowed to dry a little; the crowns then separate more readily, and appear to force all the better than when lifted and put into heat at once. Separating or picking out the flowering crowns requires experience; when this is attained, a good hand rarely fails in his judgment. The flower-spikes are formed in the base of the crowns before the time of lifting, and renders them stout and rigid to the pressure of the finger and thumb, and their presence is in this way detected. We force the crowns planted thickly in moss, and covered with it, the moss resting on slates over a chamber heated by hot-water pipes. The moss is kept constantly moist, and when the spikes of flower are well up, the roots are potted into 48-size pots, putting seven to nine plants in a pot; these are used for room decoration in vases, &c. For cutting the plants are either left until the flowers are cut, or they are planted in pans or pots of larger size. At the time of picking out the crowns for forcing, the next strongest are put on one side for making new plantations; the planting of these is usually done early in the year, the plants being planted in rows 8 or 10 inches apart, and 3 or 4 inches apart in the rows. Our plants have been grown in borders of different aspects, but the roots have usually turned out best from a border with a western aspect. In preparing the borders, a good dressing of leaf-mould is dug in, and the crowns are unclashed with leaf-mould, and receive a fresh covering in spring each year. Lifted. Grown in this way, the plantations rarely require water in hot or dry weather, which, after full development of the leaves, tends to ripen the crowns. I should also mention that our practice is to take care of any single crown that develops an extra fine flower-spike, and to grow it on for future plantations, as we find such crowns and their increase usually retain extra strength. *John Wallis, Orwell Park.*

ORCHID NOMENCLATURE.—The long deferred settlement of this question upon Orchid nomenclature has led many to doubt its accomplishment during the lives of the present generation of Orchidologists. Five years ago much was expected to result from the Orchid Conference, unhappily frustrated by the absence of one whose assistance would have been weighty on the subject. Now, after a considerable lapse of time, a committee appointed by the Royal Horticultural Society is carefully deliberating and considering a report upon the subject. As we must presume this committee was selected for its individual capability, why were the private suggestions, published the other day in the *Orchidophile*, made to the committee at all? Would it not have been better to have left them to furnish their own well-discussed suggestions to the Council of the Royal Horticultural Society without interference of any kind? There is no doubt that suggestions expressing the unanimous deliberations of this qualified body of gentlemen will be eagerly looked for and accepted, and we may venture to hope that it will not be long delayed. Whilst deliberating on this subject, there appears a phase which has not attained sufficient attention, I mean amongst the more learned in orchidology—the adoption of some means of giving publicity and pro-

mulgating the name at present in use in the Orchid world to those who lack books of reference other than trade catalogues. To note a case in point, *Bifrenaria Harrisoni*, as reported at p. 358, March 22, 1890, would appear to be quite a new plant. Catalogues being of no use to find out the name of this old Orchid, specimens of which at Messrs. Veitch & Sons are bearing two or three dozen flowers on each plant. To those initiated, the plant is *Bifrenaria Harrisoni*, originally called *Dendrobium Harrisoni*, Hooker, *Exotic Fl.*, t. 129, here figured from a drawing made by Mr. Harrison, of Aigburth, Liverpool, in whose honour the plant was named. Hooker also figured it in the *Bot. Mag.*, vol. lvi., t. 2927, and Lindl. in *Past. Fl. Gard.*, iii., Xylo, 277, as *Maxillaria Harrisoni*. Don mentions it in the Appendix to *Hortus Cantabrigiense* as *Lycaste Harrisoni*, and Lindley, *Bot. Reg.*, 897, *Colax Harrisoni*. It was introduced in 1820, and is one of the ten species referred to in Hooker and Bentham, *Gen. Plantarum, Natur. Orchidoe* to Gen., 116; *Bifrenaria*, Lindl. Another plant referred to in your columns, p. 288, March 8, placed accidentally amongst "New or Noteworthy Plants," instead of "Orchid Notes and Gleanings," *Xylobium Collei*, Rolfe, cultivated with the aforesaid by Rollissons of Tooting, Don of Cambridge, &c., as *Lycaste Collei*, Lindl. *Maxillaria Collei*, Bateman, referred to in Don's *Hortus Cantabrigiense* was the first in the list of sixteen Lindleyan *Maxillarias* of the section *racemosa* (*Xylobia*) referred in Hooker's and Bentham's *Gen. Plant. Natur. Orchidoe*, to the Lindleyan untenable genus, *Xylobium*. A note of the plant, taken many years ago, is not encouraging; a brown-flowered Orchid, with sessile racemes of few flowers. Hort. Rollisson; it was introduced from Demerara in 1836. Another instance will suffice for the present, *Dendrobium plumbeum*, mentioned in *Gardener's Chronicle*, March 15, p. 336, is more correctly stated *Platyclinis glumacea*, *Gardener's Chronicle*, March 22, p. 358. *Ipsa speciosa*, referred to at p. 336, is now referred to the genus *Pachystoma*, *K. W. Eberington Dixon, Eghamburgh*. [The list of garden Orchids in course of publication in our columns is the most authoritative and complete of its kind. Ed.]

CLIANTHUS PUNICEUS.—This fine old greenhouse plant is rarely seen in such perfection as it may now in the conservatory at Umberlade Hall, Warwickshire, the seat of G. F. Muntz, Esq. It is planted out, and covers a considerable amount of space upon the side and under the roof of the conservatory, and is a sheet of flower. An ordinary flat stage is over the hot-water pipes, and at the back of these is the *Clianthus*, which was planted a few years since in loam and leaf-soil and a little rotten manure. *W. D.*

THE FLOWERING ASH.—We have two large specimens of this beautiful tree growing here and flowering every year, from about the middle of May till early in June. They never set seed, and are grafted about 1 foot above the ground. *The Hon. Mrs. Hope, Belmont, Middlethian.*

PARSLEY.—I have found Parsley which has stood through the winter rot away at the heart, and the leafage dead or dying. The result, according to my experience, does not differ from what it has been during harder or moister winters, that I had begun to attribute the mischief to some new fungus; but turning to a quantity of plants which had, for convenience, been lifted in early winter, and dibbled out into rows, and which, whilst having lost their outer leaves, had made small clusters of new ones, I found not one of these plants to be injured in any way, and therefore came to the conclusion that the rot was induced by the settling of moisture about the exposed crowns or centres, which had plenty of outer leafage, but no cluster of young leaves to protect them, as the transplanted plants had; and the frosts had finished what the moisture began. It is worthy of remark that some plants of the Moss-curl Parsley not transplanted have stood unharmed. The experience of the winter—and we should always take note of the warnings the various seasons give—will induce me to lift and transplant all the Parsley roots I want to save not later than October, so that time will be given for the crowns to produce those tufts of new leafage which have proved to be so protective to the crowns during the past winter. We will not hastily rush to a conclusion that some new disease is attacking our Parsley, or that the stocks are becoming too tender. Evidently the cause of this unlooked-for decay is of a tentative

kind, and may not occur again soon; still it is well to be prepared, and I think early transplanting will meet the evil fully henceforth. *A. D.*

CABBAGE LETTUCE.—The perusal of your very interesting article in last week's issue of the *Gardener's Chronicle*, induces me to send plants for your inspection of Golden Queen, grown, as you see, in 60-pots. A salad all the year round is comparatively an easy matter where the Cos and Endive varieties are permitted, but here Cabbage Lettuce only is consumed. Until we hit upon this plan of culture, we were often perplexed to keep up the supply of these. The plants sent are just eight weeks from the day of sowing the seed, and the varieties are Chelsea Gem and Golden Queen, which gives us at all times a good supply. *T. W. Bond, Estdad House, Godalming.* [Excellent success Cabbage Lettuces, being tender and sweet, and fit for use. Ed.]

THE HEATHER IN AMERICA.—Where did you get the idea that Professor Goodale believes the Heather will not grow in America? (p. 303). [From *Garden and Forest*, as stated at p. 265.] We have Erica vagans, E. stricta, and the real Heather, Calluna vulgaris, growing in our nurseries in the ordinary soil in which all other nursery stock is grown, and they grow as thrifflly as if they were in peat. Our soil is brick clay on a sub-stratum of easily decomposable gneiss rock. It would be called a sandy loam. There is a considerable amount of peroxide of iron in it, which gives it a rusty colour. I enclose a few twigs from bushes that have been out all the winter. Our winter has, however, been a dull and cloudy one, when evergreens suffer little. Bright light during frosty weather is more injurious than frost itself. I suppose, however, that this is well known to your gardeners. In my time, now half a century ago, should a house or pit of plants get frosted, the stereotyped and successful remedy was to shade the glass, and let the plants thaw in the dark. In our nursery practice we throw stalks of Indian corn over those things which might suffer, to shade them from bright light. This is all the special treatment the Heather gets. Then, as you see, it will "grow in America." *Thomas Mehan, Goddantown Nurseries, Philadelphia, United States.* [The specimens sent confirmed this statement. Ed.]

TRILILIUM DISCOLOR ATRATUM.—A reference to the volume of the *Botanical Magazine*, vol. 2, tab. 40, will, I think, show that the species exhibited at the meeting of the Royal Horticultural Society on the 20th ult., by Messrs. James Veitch & Sons, and named as above, and which received an award of merit, is really *T. sessile*. When it came on the table, I stated that I thought it to be identical with *T. sessile*, and in opposing the granting of the award, I maintained that a very old plant was being exhibited under another name as a new form. It was said that the fact of the green leaves being blotched with white constituted a new departure from the old types, and justified an award; and this representation largely determined the bestowal of it. But if any one will turn to the volume of the *Botanical Magazine* I have named, they will perceive that the leaves of *T. sessile* are much blotched with white, reminding one, by the character of the marking of the leaves, of some of the *Pulmonarias*. I think that the excellent condition in which the plant was presented to view was highly creditable to Messrs. Veitch & Sons, but it does appear to me inadvisable to manufacture a new species out of an old one, however unwittingly and innocently it may be done, as of the *bona fides* of Messrs. Veitch & Sons there can be no doubt. *R. D.*

CAMPANULA ISOPHYLLA.—This is a charming plant to adorn a rockery, and in its simple requirements, its masses of bright blue flowers, and perfect hardness it is unrivalled; and while we may regard it as being one of the best rock plants to flower in the summer, it is not without merit in other respects, it being one of the best basket plants that we possess. For window-boxes, too, or for draping the sides of stages in the greenhouse, and in other ways, this plant is useful. It is a most profuse flowerer, and the flowers, when fully expanded, are nearly flat, and about 2 inches across. Equally free-flowered is the white form of *C. isophylla*, and as valuable, from the purity of the white. The white-flowered variety is a comparatively scarce plant. These Campanulas are increased by seeds and division, the latter being the quicker if the following

plan is followed. At the present time put an established plant into the greenhouse; it will quickly push new shoots, and when these are 3 inches long, remove some of the surface-soil, and replace it with finely sifted sandy soil, burying the base of the shoots about 1 inch. Keep this fresh soil moist by frequent sprinklings of water, and roots will speedily form, and in a month the now well-rooted growths may be separated from the crown and planted out. This method of increasing the plant has advantages over division in the ordinary way. Six of these young growths may be planted round a 6-inch pot, and, with liberal treatment, they will soon form a potful for transferring to a basket or any other purpose. In a similar way, and with the same results, *C. fragilis*, a companion plant to the above, may be increased and grown. *J.*

DAFFODIL SIR WATKIN.—I will not intrude into the small controversy concerning the history of this fine plant, on which subject I will only suggest that some very large variety of *N. incomparabilis* appears to have been known to the early writers upon Narcissi, otherwise they would hardly have applied to it such names as "*Incomparabilis*," "*Nonpareil*," and "*Omnium maximus*." But it may interest Messrs. Dickson and others to be assured that Sir Watkin is capable of producing seed, and is not a permanently sterile plant, such as *N. biflorus*, *N. Johnstoni*, and some other Narcissi. I have at present thirty young seedling plants from Sir Watkin, besides which I had last summer the great misfortune to mislay or drop, and so lose, a small packet of seed. Sir Watkin is, however, extremely difficult to obtain good seed from. With regard to Mr. James Walker's red-cupped variety of Sir Watkin, I am rather of opinion that it is a seedling, probably from a chance seed which dropped among old clumps of the parent, and grew up amongst them unnoticed. There is no antecedent improbability that Narcissi should sport like *Hyacinthis*; but during the years in which I studied Narcissi, I have never obtained evidence of a fixed sport, though the orange-crowned kinds vary much from year to year in intensity of colouring. I may add that my own seedlings show that it is not uncommon for the yellow-crowned *incomparabilis* flowers to produce seedlings which have more red in the crown. *G. H. Englehart, Appleton, Andrews.*

FALSE MUSHROOMS GROWING ON BEDS.—I send you samples of fungus growing on some Mushroom beds here, and having somewhere read that poisonous fungi running in a bed with the true Mushroom will poison the whole, I am desirous of knowing the cause of their coming, which species it is, and if it is poisonous? as we are fearful of eating any of the produce of the bed. *W. Edwards.* [We have never heard it asserted that poisonous fungi running in a bed with Mushrooms will poison all; it is not true. Sometimes other fungi than Mushrooms will grow in such abundance that the Mushrooms themselves will be smothered. The plant growing on your beds in company with the Mushrooms is *Agaricus dealbatus*, an inoffensive production of Nature. *W. G. S.*]

"WATERLOO" STRAWBERRY.—The foliage of this excellent late Strawberry has suffered very much with me, and I am curious to know if it has been generally found to be more delicate than other varieties. The plants in young and old plantations look extremely wretched, the foliage being as brown as possible, much more so than Noble, La Grosse Sucrée, President, Sir Joseph Paxton, Pauline, Oxonian, and others growing alongside, and equally exposed; although all of those named show injurious effects due to the frost blast of March 1, when 20° of frost were registered. Vegetation generally suffered considerably. *W. Croup, Madresfield Court.*

MONTBRETIA POTTSII.—At page 301, your correspondent, "Mr. F. W. Burbridge," asks for the experience of any cultivator of this plant. I am not able to go so far back in my experience as he requires—namely, ten or twelve years, still from what I have known of the plant during the past five years I have grown it, I am enabled to form a better opinion of it than in seeds of mixed herbaceous plants, and which were planted five years ago in the positions that they now occupy. The plants have been allowed to extend, not being interfered with in any way, and the only cultural attention which they have received has been a slight forking of the soil amongst the growths, and a liberal dressing of short dung and ashes when the beds are dug. This

always had a good proportion of flower-spikes; and last year they were finer and more numerous than ever, the blooms in the centre of the clumps being as good as those at the outside or younger portions. The plant is much admired here, and is cut largely by the lady of the house for furnishing large vases. I am inclined to attribute our success with this plant in a great measure to a hint I got from a nursery foreman that "If you want it to do well you must leave it alone," and I shaped my course accordingly. *J. U. Mil-Sussex.*

FUNKIAS.—These are, in a general way, only used in the herbaceous border, where during the spring and summer they are very ornamental; but valuable as they are there, they are doubly so in pots, and may then be employed as indoor or greenhouse decoration. The best perhaps among them is *F. Sieboldii* which sends up by broad foliage, supported on tall stout footstalks, the green being of a very deep tint and the surface glaucous. To have plants in pots, clumps should be taken up and cut through, so as to get several crowns in each piece, and be potted in rich soil. A gentle heat may be employed to hasten the flowering of these. *J. S.*

SOCIETIES.

ROYAL HORTICULTURAL.

The following were the awards made by the various committees on the occasion of the meeting on March 25:—

By the Ornith Committee.

First-class Certificates.

To *Lalio-cutleya Hippolyta* from Messrs. J. Veitch & Sons.

To *Dendrobium Wardianum* Schroderi var. from Baron Schroder.

Second of Merit.

To *Cuttleya Triana* Tauriana, from F. G. Tautz, Esq.

Cultural Certifications.

To *Angraecum citratum* var. \times from W. F. Darnell, Esq.

To *Oncidium sarcelles*, from W. C. Walter, Esq.
To *Cyrtopodium Sandlegianum*, from A. H. Smee, Esq.

By the Floral Committee.

First-class of Merit.

To *Iris Sindjarcensis*, from Messrs. Barr & Son.

To *Tillium discolor atratum*, from Messrs. J. Veitch & Son.

To *Dactylis canaliculata* R. pl., from Mr. W. C. Leach.

To *Philadelphus inodorus*, from Mr. W. C. Leach.
To *Lily of the Valley Fortin's* var., from Mr. E. Morse.

Medals.

Silver-gilt Bankian, to Messrs. B. S. Williams, for group of plants.

Silver-gilt Bankian, to Messrs. J. James & Son, for group of Cinerarias.

Silver-gilt Bankian, to Messrs. Paul & Son, for group of Roses.

Bronze Bankian, to Messrs. Barr & Son, for cut flowers and Daffodils.

Bronze Bankian, to Messrs. W. Cutbush & Son, for group of Epurcis.

Bronze Bankian, to Messrs. H. Cannell & Son, for cut blooms, double Cinerarias, and zonal Pelargoniums.

Scientific Committee.

MARCH 25.—Present: D. Morris, Esq., in the chair; M. Henry de Vilmorin, ex-President Botanical Society of France; Messrs. Blandford, MacLachlan, Wilson, Rev. W. Wilks, and Dr. Masters.

Figs.—Branches were exhibited covered with a brown scale, which the sender said had proved very injurious. The remedy suggested was to scrub the branches with a hard brush and soap suds. The specimens were further referred to Mr. MacLachlan for examination and report. Other branches of Fig in a dying condition were apparently free from parasites, and their condition betokened some mischief at the root.

Iris Sindjarcensis.—A plant of this was exhibited by Messrs. Barr & Son, and received a botanical

certificate. M. de Vilmorin pointed out its resemblance to *Iris orchidacea*.

St. Helena Ebony.—Mr. Morris alluded to the peculiar vegetation of St. Helena, now confined, for the most part, to a small area in the central and higher part of the island. Many of the trees formerly native to the island are now all but, or quite, extinct. Among them is a species of *Trochetia*, or *Melbania*. The trunks of this tree are embedded in the cliffs of the island, and are dug out by the inhabitants for the sake of manufacturing ornaments. The following quotation from Melliss's exhaustive work on St. Helena refers to this plant:—"The native Ebony of St. Helena.—This plant, I believe, to be now extinct. It formerly grew on the outer portions of the island, near the coast, at altitudes of 2 to 4, where the weather-beaten stems are still found deeply embedded in the surface-soil. The last plant I saw was a small one growing in the garden at Oakbank, about twenty-five years ago, but it is not there now, and I have searched the whole island over for another, but in vain. The leaves were dark green, and the flowers white; the wood is very hard, heavy, black in colour, and extremely brittle. It is still collected and turned into ornaments, which are much prized on account of its rarity. That this tree once formed a considerable portion of the vegetation clothing the island on those parts that are now quite barren, is strongly evidenced by the many references to it in the local records. Pl. 29. It is the *Dombeya erythroxylon* of Andr. *Bot. Repos.*, vi., t. 383, not of Willdenow.

It is interesting to know that the plant is still in existence under cultivation at Kew (and perhaps elsewhere), under the name of *Dombeya erythroxylon*. At the present time the plant, which was obtained from the gardens at Herrenhausen, is in flower at Kew.

Mr. MacLachlan called attention to the interesting remark on the rare plants of St. Helena, contained in Mr. Wollaston's book on the Coleoptera of the Atlantic islands.

Fragrant Citrus.—Dr. Masters showed a drawing of a fruit that had ripened in the garden of Mr. Hanbury, at La Mortola, near Ventimiglia, and made some comments on the peculiarities of its structure. M. de Vilmorin said that similar malformations occurred in other Oranges, especially in the Bitter Orange, the flowers of which were used in perfumery, and in which the carpels might be seen occasionally in all stages of dissociation.

Sport of Narcissus.—From Mr. Walker came one bulb producing two distinct flowers, viz., *Silver Phenix* and *N. incomparabilis* fl.-pl. The specimen was referred to Dr. Masters for further examination.

Florida Pine.—From Mr. Divers came a cone of *Pinus cubensis* (Elliotti), and one of *P. inops* var. *clausa*, just brought home from Florida. Mr. Morris spoke of the wood of the Cuban Pine, as being very hard, and said that many colonies were now importing soft wood, not that their own forests were destroyed, but because the timber yielded by them was too hard to be used profitably. M. de Vilmorin pointed out the difference between the typical *Pinus inops* and the specimen exhibited.

ROYAL BOTANIC.

The following is a list of the plants which received Certificates at the meeting on March 25:—

BOTANICAL.

To *Lalio-cutleya Hippolyta*, from Messrs. J. Veitch & Son (see Royal Horticultural Society's report).

To *Angraecum citratum* var., from Mr. W. F. Darnell (see Royal Horticultural Society's report).

To *Oncidium Larkianum*, from Mr. Larkin.

To *Tulipa Kaufmanniana*, from Messrs. Paul & Son.

FLORICULTURAL.

To *Amaryllis*, *The Champion*, from Messrs. J. Veitch & Son.

To *Amaryllis Olive*, deep intense scarlet, from Messrs. J. Veitch & Son.

To *Amaryllis John Heal*, dull crimson with white tips.

To *Cineraria Gem*, from Mr. J. James.

To *Clivea Stansel Beauty*, from Messrs. J. Laing & Sons.

To *Clivea Meteor*, and *Epiphyllum Russellianum* var. *Gaertneri*, from Messrs. B. S. Williams & Sons.

To *Cyclamen*, Duke of Fife, from the St. George's Nursery Co.

CRYSTAL PALACE.

The first of this season's flower shows was held last Saturday, when, doubtless owing to the fact that the date is late for this season, the display was not of the usual quality, and competition was small. Messrs. J. Laing & Sons, Forest Hill, S.E., were 1st for a group arranged for effect, and had a good selection of plants; Mr. James, Castle Nursery, Norwood, was a good 2nd, showing an arrangement which was an improvement on his former methods.

Messrs. H. Williams & Sons, Fortis Green, Finchley, were awarded 1st prizes for deserving exhibits of Hyacinths, Tulips, Narcissi, and Lily of the Valley. A group of *Azalea indica*, in medium-sized and fairly well-flowered specimens came from Mr. R. Wells, Longton Nursery, Sodenham; and the St. George's Nursery Company, Hauxwell, showed a nicely grown lot of Cyclamens, and in the competition was awarded the 1st prize.

Amateurs made a fair display. Mr. W. Clark, gr. to W. Sopper, Esq., Eversley, Herne Hill, led for Tulips in a close competition. Mr. Shoemith, gr. to M. Hodgson, Esq., Shirley Cottage, Croydon, was 1st for Narcissi, with good potfuls. Mr. J. Lambert, Elfdale Lodge Gardens, Herne Hill, led for Lily of the Valley; while Mr. J. Ford, gr. to Sir C. Pigott, Bart., Hexham Park, Slough, was the most successful exhibitor of Cinerarias here, and also in the open class, having large well-flowered plants; Mignonette was well represented by the lot sent by Mr. A. Carter, gr. to Alderman Evans, Ewell.

Noncompetitive groups were sent by Messrs. B. S. Williams & Son, Upper Holloway, who had Cliveas, Hyacinths, Lilia, &c.; Messrs. Paul & Son, Old Nurseries, Cheshunt, an interesting collection of alpinas, also pot-Roses and Amaryllis; Messrs. Barr & Son, Covent Garden, showing a collection of Daffodils.

BATH FLORAL FETE SPRING SHOW.

Of the five exhibitions held by the committee of the Bath Floral Fete, one of the pleasantest is the spring show, which took place in the Assembly Rooms on the 19th inst. It was extensive, thoroughly representative, and delightful; and stove, greenhouse, and foliated plants as well as Orchids alternated with Hyacinths, Tulips, Crocus, &c.

Hyacinths.—There were four classes for these, the best thirty-six came from Messrs. R. T. Veitch & Sons, of Exeter. Mr. George Garraway, Bailbrook, was 2nd. Mr. G. Garraway had the best twelve shown in six pairs.

In the Amateurs' class for twelve, Dr. Budd was 1st with a very good lot indeed; and he was also 1st with six varieties.

Tulips in pots were a bright feature; the best twelve pots came from Messrs. R. T. Veitch & Son; Mr. Marsh, gr. to J. M. Dunlop, Esq., Bristol, was 2nd.

There were two classes for six pots of Tulips, one of singles and one of doubles, Messrs. Marsh and Budd taking the chief honours.

Narcissus.—The Polyanthus varieties, shown in sixes, were good, but they did not win the admiration aroused by the single Daffodils in pots. An excellent collection of twelve was shown by the Rev. E. Handley, of Bath; Dr. Budd being a good 2nd. Such fine forms as Golden Spur, Countess of Annesley, Sir Watkin, Emperor, Empress, and Horsfield were seen in excellent form.

Amaryllis.—Some well-grown and bloomed specimens were shown by Mr. Hawkins, gr. to Mr. Jolly, Bath, and Mr. C. H. Gabriel.

Azaleas.—Some good specimens of these for the season of the year were staged by Mr. C. W. Mackillop; the second prize was taken by Mr. H. Jones, of Bath. The finest specimen was Duc de Nassau.

Orchids.—Since the Rev. E. Handley has taken to exhibiting Orchids, they are always seen in good condition at the Bath shows. His gardener, Mr. E. Kershake, was placed 1st on this occasion with six specimens, having *Dendrobium nobile*, *D. nobile pendulum*, *Cymbidium lowianum*, *Odontoglossum triumphans*, O. Edwardsii, and *Cattleya Trianae* Leeanne, he being the only exhibitor. Mr. R. B. Cator, Bath, had the best three specimens, having good examples of *Cypripedium villosum*, *Dendrobium Wardianum*, and *Cattleya Trianae*; Mr. C. W. Mackillop was 2nd. The Rev. E. Handley had the best specimen, having a fine piece of *C. Trianae*; Mr. J. T. Holmes coming 2nd with a good piece of *Cologyea cristata*.

Roses in pots, shown in collections of six speci-

mens, were remarkably well shown by the Rev. E. Handley and Dr. Budd.

Cinerarias.—These were represented by good plants. Cyclamens were fairly good; Chinese Primroses were numerous. Table plants were good, but Violets limited in quantity.

Collections of plants, arranged for effect, were a good feature. Ornamental foliated plants in sixes, the best coming from Mr. W. C. Drummond, of Bath. There was a class for four specimen stove and greenhouse plants, and for six exotic Ferns and mosses.

A special feature of interest was a class for a group of Daffodils shown in pots or boxes, tastefully arranged with moss, the prizes being offered by the Rev. E. Handley. The donor of the prizes had the best collection, Messrs. R. T. Veitch & Son, being 2nd.

Fruit was represented by Apples and Pears. A dish of excellent Cornish Gillyflower best represented the first, and well preserved Beurré Reine the second.

Of miscellaneous collections, a most interesting group of Orchids, intermixed with foliage plants, came from Mr. J. Cypher, Cheltenham. Messrs. G. Cooling & Sons, Bath; A. A. Walters, Bath; and R. T. Veitch & Sons also had collections of plants; and Mr. R. B. Cator a basket of pretty Primroses.

VEGETABLE PRODUCTS IN THE DRUG MARKET.

A STUDY of the trade reports in the various commercial journals is both interesting and instructive, and none more so perhaps than those which are classified under the head of drugs. Thus, in reference to Cloves, we quote the following from a report of a Rotterdam firm, which appeared in a contemporary recently:—"Zanzibar reports under date February 2 last, state that the total crop this season is by far the largest on record, and is estimated at 800,000 fathels, or about double the yield of former abundant crops. A fathel equals 35 lb., and the total yield, therefore, will be about 28,000,000 lb., while the average requirements of the whole world are estimated at only just over 11,000,000 lb. Prior to 1871, the price of fair Zanzibar Cloves in London averaged from 3*sd.* to 3*½d.* per lb.; and although, since then, an export duty of 15 per cent. of the value has been established, the difference between the prices mentioned and the actual quotations of say, 4*½d.* to 4*¾d.*, is much larger. The large yield is undoubtedly a consequence of the replanting which has been going on in Zanzibar after the hurricane in 1872, the trees having now attained their full growth. The fact that the tree bears fruit every second year only, leads to the supposition that the next crop will be a small one; but it is said that a much larger number of trees has been planted since the hurricane than ever existed before. At any rate the current crop is much in excess of the requirements, and concurrently with this exceptional Zanzibar crop the yield of Cloves in the island of Ambonia (Netherlands Indies), though of much less importance commercially than Zanzibar, has also been greatly in excess of the average."

Commenting on this, our contemporary makes the following remarks:—"In reply to these alarming statements, it is said that no European house can possibly have any means of correctly estimating the crop of Zanzibar Cloves, as the bulk of this article is produced on the small island of Pemba, north of Zanzibar, which is entirely in the hands of the natives, who do not allow any foreign traders to obtain accurate news of the crop, but the estimate given by the Dutch firm is thought to be much exaggerated. Meanwhile it is a fact that our market continues to decline, and Zanzibar Cloves on the spot have fallen from 4*½d.* to 4*¼d.* per lb."

CUBES.

Genuine Cubes, it is well known, are the fruits of *Piper cubeba*, but these small berries are liable to much adulteration, and the berries of some other species of *Piper*, as well as of plants not botanically allied, are sometimes offered for sale, or are even

mixed with them. At the drug sales recently nineteen bags, described as partly doubtful, mixed, slightly stalky berries, were bought in at £22 to £23 per cwt. It is also stated that a telegram from Java, received at Amsterdam on the 19th inst., announced that the last crop would turn out to be a small one, that prices in Java were held very high, and that the shipment of cultivated berries had probably ended, so that there is reason to suppose that the whole of the last crop of cultivated Cubes has already been received in Europe.

MUSK SEED.

This seed, the produce of *Ilibiscus abelmoschus*, was some years ago used in perfumery in this country, as a substitute for animal musk; it, however, never found much favour with the perfumers, and was chiefly utilised in the composition of sachet powders. The seeds have recently been brought again into commerce, and are now quoted in the wholesale market at 6*½d.* per pound.

PIURI.

This substance, which is also known as Indian Yellow, was the subject of an exhaustive report on its manufacture in 1883, by Mr. T. N. Mukharji, of the Art and Economic Museum, Calcutta, who was deputed by the Indian Government to visit Mirzapur, where the Piuri is almost exclusively prepared, and obtain exact information as to its manufacture. Mr. Mukharji proved that this yellow colouring matter was obtained from the urine of cows that were specially fed for the purpose on Mango leaves. More recently Prof. Graebe has worked out the chemistry of the substance, and the two reports have been re-published in the number of the *Kew Bulletin* for March. Three cases of Piuri were shown at the London drug sales on the 20th inst., the price quoted for which was 6*½d.* per pound. The appearance of this substance in the London market is probably due to the publication of Prof. Graebe's paper, in the December number of the *Geneva Archives des Sciences Physiques et Naturelles*. It will be interesting to note whether the substance from this becomes an article of commerce in this country. [This substance was mentioned in our issue for March 22, p. 362. Ed.]

VARIORUM.

PSEUDOPANAX FEROX, T. KIRK (THE TOOTHED LANCEWOOD).—The remarkable changes of foliage through which it passes in its progress to maturity, and the different aspects which it presents, are of great interest, and must be briefly described. The cotyledons, the first leaves developed on the germination of the seed, are oval, flat, and membranous; they are quickly succeeded by narrow-linear leaves, one-eighth of an inch broad, toothed, and of harsh texture; as the stem increases in height the leaves retain their linear form, but increase in length, and become slightly expanded at the apex. At first they are given off at a right angle with the unbranched stem, but ultimately become deflexed, the lower surface of the leaf forming an acute angle with the stem. As they attain a length of 18 inches, with a breadth of half an inch, these thick, rigid, linear leaves pointing to the ground present a strange appearance, which has only a single parallel in the New Zealand flora. In this stage their texture is extremely coriaceous and rigid; the stout midrib is conspicuous along the entire length of the leaf, the surface is blotched and mottled, and the margins are furnished with large lobulate-hooked teeth, capable of inflicting a severe wound if incautiously handled. The exact duration of this stage is unknown, but plants have been observed to exhibit no change for thirty years or more; some of the leaves are persistent for twenty years. On approaching the period of maturity the simple stem branches at or near the apex, the new leaves are shorter, and gradually assume an erect position, the texture becomes thicker and more rigid, but the spinous teeth entirely dis-

appear; new branches are developed, and the plant forms a round-headed tree, with the lower parts of the branches naked, but exhibits absolutely no trace of the remarkable form of leaf which characterised its intermediate stage.

DACRYDIUM BOWILLII (the Mountain Pine) is a small species forming a handsome conical or dome-shaped shrub, from 2 feet to 12 feet high, with a very short trunk rarely exceeding 1 foot in diameter, and usually only a few inches, with spreading, often horizontal, branches.

THE WEATHER.

[By the term "accumulated temperature" is meant a figure representing the aggregate amount, as well as the duration, of the excess or deficit of temperature above or below 42° Fahr. for the period named; and this combined result is explained in Day-degrees. "Day-degrees" signifying 1° continued for twenty-four hours, or any other number of hours for an inversely proportional number of hours.]

Table with columns: DISTRICTS, TEMPERATURE, RAINFALL, BRIGHT SUN. Sub-headers include: Above 42° or below 42° Mean for the Week, Accumulated, Day-deg., Below 42° for the Week, Above 42° difference from Mean since Jan. 1, 1890., Rainfall, No. of Rainy Days since Jan. 1, 1890., Total fall since Jan. 1, 1890., Percentage of possible Duration for the week, Bright Sun. since Jan. 1, 1890.

The districts indicated by number in the first column are the following:— 1, Scotland, N.E.; 2, Scotland, N.W.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.; 7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending March 29th, is furnished from the Meteorological Office:—

The weather during this period has varied considerably. The greater part of the week was cloudy or dull, with rain almost daily in the west and north, and frequently in the south and east; occasionally fine bright intervals were experienced in all districts, and in most parts of England the conditions improved materially towards the end of the week,

while in the Channel and on our south-western coasts thick fog prevailed.

"The temperature has been above the mean in all districts, the excess having ranged from 3° in most parts of the kingdom to 5° in the Midland Counties, and 6° in the north-east and east of England. The highest of the maxima which were recorded on the 27th at most of the Irish and Scotch stations and on the 21st over England, varied from 54° in 'Scotland, N.,' to 64° in 'England, E.' and the 'Midland Counties,' and to 66° in 'England, S.' The lowest of the minima were registered on the 24th, and ranged from 24° in 'Scotland, E.,' and 25° in 'Scotland, W.,' to 37° in 'England, N.E.,' and to 43° in the 'Channel Islands.'

"The rainfall has exceeded the mean over Ireland, the West of Scotland, and southern, central, and north-eastern England, and has just equalled it in 'England, S.W.,' and 'England, E.,' elsewhere it has been rather less than the normal.

"Bright sunshine has been less prevalent, as a whole than it was last week. The percentage of the possible amount varied from 18 in 'England, S.,' and 'England, N.W.,' to 31 in 'Ireland, S.,' and to 35 in 'Scotland, E.'"

MARKETS.

COVENT GARDEN, April 2.

[We cannot give any editorial responsibility for the subjoined reports, which, however, are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations represent averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and they fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the particular prices at any particular date, and still less can they be taken as guides to the prices in the coming week. Ed.]

The holidays are now making our business very dull, especially with forced goods. A few samples of new Grapes to hand. James Webber, Wholesale Apple Market.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing plants in pots with prices. Columns include: Plant name, Price per dozen, Price per dozen in various sizes, Price per dozen in various sizes.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing cut flowers with prices. Columns include: Flower name, Price per dozen, Price per dozen in various sizes, Price per dozen in various sizes.

ORCHID-BLOOM IN VARIETY.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing fruit with prices. Columns include: Fruit name, Price per bushel, Price per bushel in various sizes, Price per bushel in various sizes.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table listing vegetables with prices. Columns include: Vegetable name, Price per bushel, Price per bushel in various sizes, Price per bushel in various sizes.

POTATOES.—Old Potatoes have been selling freely at the late low prices. Tendency for New ones: much lower price. Heavy arrivals are due this week. J. B. Thomas.

SEEDS.

LONDON: April 2.—Messrs. John Shaw & Sons seed merchants, of 37, Mark Lane, London, write that the recent favourable weather naturally increases the sowing demand. As farm seeds are now wanted for immediate sowing, and prices all round are abnormally low, open orders for prompt execution come to hand. For red and white Cloverseeds also for Trefoils and Rye grasses remarkably low rates still prevail. Alsike is firm at the late advance. There is rather more doing in Tares. Mustard and Rapeseed keep steady. Birdseeds are without change. Choice Blue Peas have become scarce. Fine new Scarlet Runner Beans are obtainable on moderate terms. Feeding Linseed dull.

CORN.

Averages.—Official statement showing the average price of British corn, imperial measure, for the week ending March 29.—Wheat, 25s. 3d.; Barley, 25s. 10d.; Oats, 18s. 6d. For the corresponding period in 1889.—Wheat, 30s. 2d.; Barley, 25s. 7d.; Oats, 16s. 11d.

POTATOS.

BOUGH AND SUITABLE FIELDS: April 1.—Quotations.—Regents, 30s. to 55s.; Hebrons, 30s. to 40s.; Magnans, black, 30s. to 45s.; Bedford, 40s. to 50s.; Lincoln, 40s. to 50s.; Yorks, 45s. to 75s.; Scotch, 47s. 6d. to 50s.; Imperators, 40s. to 70s. per ton.

HAY.

Averages.—The following are the averages of the prices obtained at the various metropolitan markets during the past week:—Clover, prime, 75s. to 92s.; inferior do., 60s. to 75s.; hay, best, 60s. to 87s.; inferior do., 25s. to 50s.; and straw, 21s. to 35s. per load.

ENQUIRIES.

"If that questioneth much shall learn much."—BACON. BUILDING A PROPAGATING-HOUSE.—"Young Florist" being desirous of building a span-roof forcing and propagating-house, would be glad if some of our readers would kindly inform him the simplest kind of house most in use by the leading market growers; the height, width, mode of heating, and construction, and what is the thickness of the walls. Besides these particulars, he wishes to be informed if houses are constructed of sufficient width for central bed to be built, if such had would be suitable to grow other plants upon while Cucumbers are growing on the side-beds. He thinks that, perhaps, the close atmosphere necessary for the Cucumbers would be unsuitable for other plants.

NOTICES TO CORRESPONDENTS.

Owing to the large extension of our circulation, we are under the necessity of going to press at an earlier time than heretofore, and request our regular correspondents to favour us with their communications as EARLY IN THE WEEK AS POSSIBLE.

A NICE POINT: B. B. The point is too nice for us to discuss. Your letter should be sent to the writer.

CAMELIAS: Alba Plena. The blooms sent were very

good, and if next season's blooms should equal them in size, they will certainly be fit for exhibition.

CINERARIAS: *J. Price & Son.* The Cineraria blooms sent by you show some rich and bright colours, and they are large, too, some being quite 3 1/2 inches in diameter; there is, however, a want of substance and solidity about the flowers.

CYTRIFOLIUM for a GREENHOUSE UNDEATED in the SUMMER TIME: *B. A. C.* insigne, C. venustum, and C. Fairiemanum. The out-of-doors species, C. Calceolus and C. spectabile, would also do well.

FUNGI on SMYRNIUM: *F. W. B.* The early or *Æcidium* condition of Puccinia Smyrniol. Not very common. *W. G. S.*

GRAPES: *A Constant Reader.* Injured, probably, by the immediate neighbourhood of the sulphur-coated hot-water pipes. Wash off the sulphur. Sulphur should not be used alone, but mixed with an equal weight of whiting or lime.

HYACINTHS: *R. S.* You cannot do better than read the articles by MM. Baarnart and Kersten in *Journal of the Royal Horticultural Society*, vol. xi., part 2 (July, 1889). The numbers of the *Gardeners' Chronicle* named by you do contain particulars of the matters you require, but are out of print.

NAMES of PLANTS: *P. J. S.* From the specimens sent, we judge the *Camellias* to be—1, *Altheiflora*; 2, *Prince Albert*; 3, *Delicatissima*; 4, *Double striped*; 5, *L'Insubria*; 6, *Candidissima*; 7, *Adelina Benvenuti*; 8, *Lavinia Maggi*—*Label*; 9, *Hernaria glabra*; 3, *Sedum glaucum*; 10, *alternanthera*; other specimens insufficient. What wretched scraps! think what they must be when we received them; and next time please send better specimens more carefully packed. Not more than six should be sent at a time.—*W. M. I.* *Acer rubrum*; 2, *Abies pinsapo*; 3, *Peperomia arifolia*.—*K. A. I.* *Boronia heterophylla*; 2, *Abutilon vexillarium*; 3, *Cacalia ficoides*; 4, *Aloe variegata*.

ROMEA AND VAPORISER: *F. S. & Co.* A useful instrument for spraying pot plants, Roses, &c., with insecticides. Used with diluted petroleum it kills fly, but not mealy bug, or scale, excepting in the case of the last named, just as the young are escaping from beneath the parent insect. We will try the *Rosika* later and report.

DIED, on March 25, at Stanley Villa, Turnham Green, WILLIAM JOHN COLEMAN, late of Covent Garden Market, aged seventy-three. Interred at Brompton Cemetery on Monday last.

SEEDS.—100 packets, 1s. 2d. post-free, genuine & fresh; other choice Seeds half price. Catalogues free. GREENHOUSE FRAMES, 12' x 12', 12' x 10', 12' x 8', LIGHTS from 5s.; FRAMES from 10s. GREENHOUSES, 200 feet. 1 foot FRAMES, 8' by 6', 20s. All painted, glazed, and put on rail.—Write, GARDNER AND CO., Tansley, Mallock, and 62, Strand, London, W.C.

ORCHID PEAT, best quality; BROWN FIBROUS PEAT for Stove and Greenhouse use. RHODODENDRON and AZALEA PEAT. Samples and Prices to WALKER AND CO., Farnborough, Hants.

TO MARKET GARDENERS, &c.—To Grow SUCH VEGETABLES and FLOWERS, Gardeners should use SUPERIOR MANURE. One trial will prove the great value of this Manure, and ensure its constant use hereafter. It can be applied either separately or mixed with ordinary Stable or Farm-yard Manure. Rose Trees and Garden Plants are much benefited by being watered with a weak solution one or twice a week. Instructions on application, post free. Price free on rail, at Sheffield, 13s. per cwt., or 7s. per 56 lb. P.O. Orders payable to the Managers, Sheffield Glass Company, Sheffield.

NATIVE GUANO: BEST and CHEAPEST MANURE for Garden use, NATIVE GUANO. Price £3 10s. per ton in bags. Lots under 10 cwt. 4d. per cwt. 1 cwt. sample bag sent, carriage paid, to any station in England on receipt of P.O. for 5s.

Extracts from Thirtieth Annual Collection of Reports:—NATIVE GUANO for POTATO VEGETABLES, FRUIT, &c.—C. F. HUBER, Reading, used it for Potatoes, and says—"I found your Manure gave very satisfactory result." C. J. WAITE, Col. to Col. the Hon. W. P. Talbot, says—"I can strongly recommend your Native Guano as a first rate Manure for any fruit or in the garden except 100 grass. In the year during which I have freely used it, I have gained over 500 prizes."

NATIVE GUANO for ROSES, TOMATOES, &c.—W. G. BAILEY, Nurseries, Bekeley, used it for Roses, Tomatoes, and Cucumbers, and says—"I find it a good and cheap article."

A. F. RABSON, Royal Horticultural Society, says—"Without doubt a very valuable Manure, and easy of application." Orders to the NATIVE GUANO CO., Limited, 29, New Bridge Street, Blackfriars, London, E.C., where Pamphlets of Testimonials, &c., may be obtained. Agents wanted.

NORMAL FERTILISER

For GREENHOUSE or GARDEN. Price—7 lb. 11 lb. 25 lb. 55 lb. 1 cwt. 2s. 6d. 3s. 6d. 5s. 6d. 9s. 11s. and in 6d. and 1s. packets.

To be had of Seedsmen and Florists, or the NORMAL MANURE COMPANY, Ltd., 121, Bishopsgate Street Within, E.C., and Euston Road, Guildford. General Trade Discount. Wholesale of Messrs. HURSTLANDSON, 152, Highgate Street, London

FOLLOWS & BATE, Ltd.,

Patentees and Manufacturers of the Patent "Victoria," "Climax," "Manchester," and Royal Anglo-American Lawn Mowers, 75, Abchurch Lane, London, E.C. 4.

To be obtained from all respectable Ironmongers and Seedsmen throughout the Kingdom, or, if any difficulty is experienced, direct from the Manufacturers.

THE MOST SUITABLE FOR SHADING ORCHIDS, FERNS, Palms, and Stove and GREENHOUSE PLANTS.

It is a strong, durable Cotton Netting, woven in squares, close as to exclude the direct rays of the sun, but admitting the greatest amount of light attainable through shading.

It withstands the weather better than any other class of Shading, and may be beneficially used on account of its homogenous texture, to keep the plants out of the hot sun. The leading Horticulturists in the country have used this material for some years, and speak very highly of it, as doing it better than they have ever used.

Sold in packages of 100 yds. long by 12 yds. wide. Price 1s. 6d. per 100 yds. Samples submitted gratis. B. S. WILLIAMS & SON, Victoria and Paradise Nurseries, Upper Holloway, London, N.

FRIGIDOMO CANVAS.

PROTECT YOUR PLANTS AND GLASS From Damp, Frost, and Cold Winds. A perfect non-conductor of heat, keeping, wherever it is applied, an even temperature.

MADE FROM PREPARED HAIR AND WOOL. To be obtained of all Nurserymen and Seedsmen, or BENJN. EDGINGTON, LONDON BRIDGE, S.E.

NOTE.—The words "FRIGIDOMO" are registered under the Trade Mark Act, and any persons using this Mark will be proceeded against.

EXTRA STOUT strong-tanned NET, 2 yards wide, 100 yds. long, 1 yard wide, 50 yds.; or 3 yards wide, 100 yds.; 4 yards wide, 200 yds.; per 100 yards. NEW TWIN NETTING, 1 yard wide, 20 yds.; 2 yards wide, 40 yds.; 3 yards wide, 60 yds.; 4 yards wide, 80 yds. COTTON NET, mesh 1/8 inch, 20 yds. long, 2 1/2 yards wide, 20 yds. long. W. COLLIER & CO., LTD., 111, Fenchurch Lane, London, E.C. 3.

SANKEY'S GARDEN POTS

Approved by the leading Horticulturists and largest Nurseries in the World, and acknowledged by all to be the lightest, strongest, best coloured, most perfect shaped and finished pots ever manufactured.

MARKET POTS,

Or Long Tubs, are largely used by Market Growers—they are made a greater depth, wider at bottom, and save half an inch on width at top over ordinary pots. Have no rims.

VINE POTS

Are used by the leading Vine Growers throughout the Kingdom, and pronounced of no equal for Vine Culture.

CHRYSANTHEMUM POTS.

Consistently deeper than ordinary, very broad at bottom, like a horn at top, do not blow over when outside. Allow maximum amount of rain for nutriment at roots of plants.

CLEMATIS POTS.

OPINION.—"Your pots are light and strong, first class colour, shape, and finish. The 'Clematis Pots' give complete satisfaction to ourselves and customers." Messrs. Wood & Ingram, Huntingdon.

ROSE POTS.

OPINION.—"We beg to say that we are highly satisfied with your standard Pots—they are well made, light, set strong, and we like them better than any others we have ever used." Messrs. Richard Smith & Co., Nurseries, Worcester.

The Flower Pots we have largely supplied us with are light, strong, and well made, and in every respect highly satisfactory. Messrs. Dicksons, Ltd. Chester. For nearly thirty years I have been using your garden pots, and still find them the best and cheapest. Mr. William Bull, Chelsea. We have always found your Pots highly satisfactory. Great improvements, but few years in them. Messrs. Pearson & Sons, Chiswell Nurseries, Notts. Samples and Prices free. Carriage and breaking free in £10. Half carriage on £5. Speciality Colored Pots and Pots.

SANKEY & SON,

BULWELL POTTERIES, NOTTINGHAM.

TANNED NETTING for Preserving Fruit Trees, Flower beds, &c. from frost and blight. 3 square yards for 1s.; send us with application for Catalogue and price list and return to H. J. GIBSON, Fish Market, Fish Street, London, E.C. 3.

THOS. W. ROBINSON,

Dennis Park Ironworks, Stonebridge.

Orders executed promptly by all Ironmongers. RANSOMES, SIMS & JEFFERIES, Ltd., IPSWICH.

HILL & SMITH, BRIERLEY HILL IRONWORKS, STAFFORDSHIRE.

New Pattern Tree Guard, "THE PORCUPINE."

The maximum of utility and the minimum of cost. Constructed of strong Iron Uprights and Galvanised Barbed Wire.

Price, 10s. 6d. each.

TESTIMONIALS. The Gardens, The Whittier, Kingston, Feb. 9, 1888.

Dear Sir,—The two Barbed Wire Tree Protectors you sent to Mr. Green's order I have now fixed to the trees, and I feel bound to say that I never saw anything in the shape of a tree-protector equal to them. I think I shall be able to add further testimony after the cattle are turned out in the spring.—Yours faithfully, J. WEARING.

The Gardens, The Whittier, Kingston, Sept. 26, 1888.

Gentlemen,—The 100 Porcupine Tree Guards you supplied to Mr. Green's order have proved a great success—in fact, they are the best I ever saw. These guards stand well against the trees, therefore cattle cannot, and will not, attempt to reach the branches. I would strongly recommend anyone who contemplates planting trees, and wishes to know which is the best guard to use, to give pattern "C" a trial. Yours faithfully, J. WEARING.

Made in Halves to Bolt together.

Messrs. Hill & Smith

ANTHRACITE COAL

The Best and Cheapest Fuel for Greenhouse Boilers, Stoves, and Heating Apparatus.

HENDREFORGAN ANTHRACITE SMOKELESS COAL.—The UNITED ANTHRACITE COLLIERIES (Limited) supply their Nut or Cobble Coal (the Nuts being about the size of a Walnut, and the Cobbles about the size of a man's fist), delivered in truckloads to any railway station. This coal is ABSOLUTELY SMOKELESS, and it requires much less attention than any other description of fuel, burning for twelve hours at LEAST without any supervision, and giving from five to ten degrees more heat than coke. Quotations can be had on application to the Company's Offices, 2s, Lime Street, London, E.C.

Quotations for London delivery can be obtained for the Northern, Western, and South-Western districts, from Messrs. G. R. CARTER AND SON, Coal Eschews, &c.; and for the South-Eastern district, from Messrs. W. DOWELL AND CO., Coal Merchants, Greenwich, S.E.

To Nurserymen, Seed Merchants, and Florists. J. BLICKBURN AND SONS are offering Archangel Mats lower than any other house in the trade; also Petersburg Mats, and Mat Bags, Katha Fibre, Tobacco Paper, and Shading. Prices free,—4 and 5, Wornwood Street, E.C.

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is

THE "WORCESTER HERALD,"

ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisements would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other Property advertised in the Columns of the "HERALD."

Sales of Stock and Agricultural Effects. The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let. Land Agents, Estate Managers, and all having Farms to Let would do well to advertise in the "WORCESTER HERALD," the Leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted. For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

Apply for terms. SPECIMEN FREE. Price 2d. Published Friday for Saturday.

SHOPMAN, or ASSISTANT.—Age 22; six years' experience in Seeds, Plants, &c. Excellent references. Recommended as a remedy for such chronic affections as Liver Enlargements, Congestion of the Lungs, Torpidity of the Kidneys, and other functional disorders which cause much present suffering, and if neglected may the foundation of organic disease. Holloway's Pills are specially adapted for the young and delicate; their gentle and purifying action ranks them above all other medicines. In Indigestion, Nervous Affections, Gout, and Rheumatism these Pills have achieved for themselves a high and deservedly high reputation. They expel all impurities from the blood, and thus restore cheerfulness and vigour.

HOLLOWAY'S PILLS.—Liver, Lungs, and Kidneys.—Most diseases of these purifying organs arise from obstructions, over the removal of which these celebrated Pills exercise the most perfect control. A course of them is strongly recommended as a remedy for such chronic affections as Liver Enlargements, Congestion of the Lungs, Torpidity of the Kidneys, and other functional disorders which cause much present suffering, and if neglected may the foundation of organic disease. Holloway's Pills are specially adapted for the young and delicate; their gentle and purifying action ranks them above all other medicines. In Indigestion, Nervous Affections, Gout, and Rheumatism these Pills have achieved for themselves a high and deservedly high reputation. They expel all impurities from the blood, and thus restore cheerfulness and vigour.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1890.

The Winners of every Highest Prize in all cases of competition, and they are the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by—
HER MOST GRACIOUS MAJESTY THE QUEEN on many occasions,
HIS ROYAL HIGHNESS THE PRINCE OF WALES,
THE KING OF THE BELGIANS,
The Late EMPEROR OF THE FRENCH, THE EMPEROR OF RUSSIA,
And most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "Journal of Horticulture," of June 9, says:—"MOWING MACHINES.—After a critical examination the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 150,000 of these Machines have been Sold since they were first introduced in the year 1856. And thousands of unsolicited Testimonials have been received, testifying to their superiority over all others. They have been submitted to numerous practical tests in Public Competitions, and in all cases have carried off the Highest Prize that has been given.

- 1st. Simplicity of Construction—every part being easily accessible.
- 2nd. They are worked with much greater ease than any other.
- 3rd. They are the least liable to get out of order.
- 4th. They make little or no noise in working.
- 5th. They will cut either short or long Grass, wet or dry.

Special quotations made for Rollers, 3 feet, 3 1/2 feet, and 4 feet Diameter, fitted with Shafts for one or two horses.

SPECIAL.—A FEW TESTIMONIALS OUT OF THOUSANDS RECEIVED.

Bathurst, Ashford, Kent, June 14, 1878.
Gentlemen,—Your "Silens Messor" Mower, 20-inch, works splendidly. It is a most perfect machine, and beats the old 20-inch one that for so many years did my work without repairs. I recommend your machines, and never see any doing such good work and with so little power. You may refer any one to me, and I will then show them the S. M. at work, and I shall show it to all I can. I am, yours truly,
Messrs. Green & Son, W. H. MOLD.

Kinshiry, Hungerford, April 20, 1883.
Sirs,—I shall be glad of a list of your Lawn Mowing Machines priced. I am glad to mention that I bought one of your 14-inch machines 22 years ago. It has had hard and rough usage every year since, and only on Monday was it put quite out of use by the snapping in two of the driving wheel under the hammer. It is recommended to think of the work it has done, and done well. I am, yours faithfully,
Messrs. Green & Son, ALFRED T. HAZETT.

Ivy Bank, Broadway, Worcester, April 13, 1884.
Gentlemen,—Some fifteen or sixteen years ago, I had from you one of your 12-inch Lawn Mowers which, I may say, has from that day to the present time given perfect satisfaction, and goes as easily, and does its work as well now as it did at first. I have recommended yours as the best machine ever seen. I am, yours faithfully,
Messrs. Green & Son, Leeds, C. FRENCH BARTLEY.

15th ROYAL GARDENS, WINDSOR, January 28, 1890.
To Messrs. Green & Son, Limited, Leeds.
Dear Sirs,—In sending you the enclosed order for Lawn Mowers, I think it may be interesting to you to know that I am still using the Horse Machine you supplied in the year 1866; it is in perfect order even now, which is a proof that the workmanship is first-class, and speaks for itself.
As to your "Hand Silens Messor," no Lawn Mowers could give greater satisfaction either to myself or to the men who work them, they are unequalled.
During the season I have them in daily use in the Royal Gardens here, and never have the slightest trouble with them. Your machines are also the only ones I have in use at the Private Gardens, Hampton Court Palace; the Royal Lodge, Windsor Great Park; Cumberland Lodge, and the Royal Pavilion Gardens, Aldershot.
I shall feel a great pleasure in recommending them to all my friends. I remain, dear Sirs, Yours very truly,
THOMAS JONES.

Wellingborough, February 4, 1890.
To Messrs. Green & Son, Leeds.
Gentlemen,—I have sent you our Lawn Mower for repairs, which please have done to it. I have used your machines for 25 years, and I find them more durable and do their work better than any other machines I have seen.
I am, gentlemen, yours truly,
BAYB RECALVAL,
(Gardener to W. Blatt, Esq.).

Cottingham, Hull, February 13, 1890.
To Messrs. Green & Son, Limited, Leeds.
I am instructed by Arthur Harrison, Esq., of Northgate House, Cottingham, near Hull, who has had one of your 36-inch Horse Mowers in use over 20 years, and ask whether you think it advisable to send it far repair or have a new one, for it is as you may suppose now getting worse for wear. Kindly say per return, and enclose Price List.
I am, gentlemen, yours truly,
JOHN BAYNTON.

15th Mr. J. R. STIRLING, of the ROYAL GARDENS, BUCKINGHAM PALACE, writing under date February 24, 1890, says:—"As regards the work your 42-inch Horse Machine does (which two years ago took the place of the one you supplied in '63), I may say it is kept in constant use here from February until the end of the mowing season, and continues to give the greatest satisfaction. It is the best Machine I know for good work and durability, and your 'Hand Silens Messors' also excel all others. We have no other Lawn Mowers in use here, and I always recommend them to all my friends who inquire about Lawn Mowers."

GREEN'S PATENT "MULTUM IN PARVO" LAWN MOWER.

HIGHLY RECOMMENDED FOR SMALL LAWNS.

PRICES, With Grasshook.

WHEELER'S SUPERB CALCEOLARIA.

We can supply you with our strain of Calceolaria. The flowers are large, well formed, and beautifully spotted; the variety of shades of self colours also renders them most attractive. The flowers are raised up above the rich broad foliage, thus forming perfect arches of bloom. Per Packet, 1s. and 2s. 6d., post-free.

I was awarded 1st Prize for this Calceolaria grown from your seed. G. SWAIN.

I am more than delighted with the Calceolarias grown from your seed. They are greatly admired by all who see them. Mrs. W. HAY.

I have been for some time endeavoring to write to state how beautiful our plants of Calceolaria from your seeds have been this year. Such a collection of colors I have nowhere seen, and they have gained the highest praise. W. W. PHILLIPS.

A PRICED LIST of WHEELER'S FLOWER SEEDS with full details and prices. Free. It comprises a grand selection of the choicest and best varieties.

WHEELER & SON, SEED GROWERS, GLOUCESTER.

For Green and Black Fly, American Blight, Camellia Scale, Red Spider, Mealy Bug, Brown and White Scale, Worms, Wood Lice, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE.
SAFE—ECONOMICAL—EFFECTUAL.

15, PRINCES STREET, EDINBURGH, July 15, 1887.—"Dear Sirs, I have thoroughly tested a sample of a new Insecticide which you were good enough to send me. At the rate of 1 oz. to a Gallon of water at a temperature of 95°, I find it kills Green Fly immediately. Double this strength, or 2 oz. to a Gallon at 120°, seals the fate of Scale of all sorts in a few seconds; while 3 oz. to a gallon at same temperature effectually dissolves Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through common syringes for Garden engine, a much better way of efficiency than when applied by hand-washing or spray—I remain, dear Sirs, yours truly. (Signed) A. MACKENZIE," of Messrs. Molyneux & Sons.
Victoria and Paradise Nurseries, Finner Holloway, London, January 7, 1888. "GENTLEMEN—I have given your Insecticide, 'Picrena,' a good trial in competition with many others. I am pleased to say that I have found it to be more effectual in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale. (Signed) B. S. WILLIAMS."

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins of 1 and 2 gallons at 10s. 6d. and 20s. each; in quantities of 5 gallons and upwards, 35s. per gallon.

Prepared only by DUNCAN, FLOCKHART & CO., Chemists to the Queen, Edinburgh.

May be had from R. S. WILLIAMS, Victoria and Paradise Nurseries, Finner Holloway, London; and from WILLIAM EDWARDS AND SON, 157, Queen Victoria Street, London.

(VAPOUR CONE).

Nothing can surpass this method for the total destruction of Insect Pests in Greenhouses. It CANNOT fall where the hot-air is secure. No possible injury to the most delicate plant.

PRICES—For Frames, 50 ft. of 20-inch feet, 6d.; 100 feet, 9d.; Houses, 50 ft. 100 feet, 1s.; 1000 feet, 1s. 6d.; 4000 feet, 5s. each. Owing to the enormous demand, intending users should give their Seedsmen Early Orders to secure a supply.

SOLE MANUFACTURERS:
CORRY, SOPER, FOWLER & CO.
(Limited), LONDON.
TO BE OBTAINED OF ALL SEEDSMEN.

"ROSIKA"

Trade-Mark Registered. Effective, Harmless. Promptly clears Roses and all plants from green fly, caterpillars, spiders, and other insect pests. It recommends itself to all who have tried it for its efficiency, pleasant odour, the facility with which it is applied, and its cheapness in application; so that anyone, however particular, can use it, and it is always ready for use. Price 1s. Sold at all Chemists and Seedsmen, or direct from the manufacturers, F. SCHUTZE & CO., 35, Aldersgate Street, London, E.C. Apparatus for use of Rosika, 3 sizes, 1s. 6d., 3s., and 4s. 6d.

BENTLEY'S WEED DESTROYER.

Mr. E. Molyneux, 8, Manmore Park Gardens, writes:—"I am much pleased with the Weed Killer. In addition to killing the Weed effectually, the gravel on our paths is rendered particularly bright by its use."
For further testimonials and prices, all particulars, apply to the sole maker, JOSEPH BENTLEY, Chemical Works, Barrow-on-Humber, HULL.

LAWNS.

A Word of Practical Common Sense by an Experienced Man:—"Do not use Stimulating Fertilisers on Lawns; they draw up the blades of Grass quickly, but it is at the expense of the turf roots, which are left thin and hungry."

BEALE'S CONCENTRATED FARM-YARD MANURE

Feeds the Roots and Thickens the Mass of Turf. It can now be used with effect. It makes a perfect Match for Bedding Plants, Strawberries, &c., besides being the most valuable Top-Dressing for Lawns and Borders. It keeps the soil cool, and saves Watering.
Our Special Quality, as supplied for the Kennington Oval and other important grounds:—8s. 6d. per sack; Ordinary Quality, 6s. Two sacks equal a Load of Stable Manure. Full particulars in our NEW LIST of all GARDEN REQUISITES. Sole Manufacturers, W. H. BEESON & CO., 157, FINSBURY PARK, LONDON, N.

GREAT REDUCTION IN PRICE OF STANDEN'S MANURE

Established Nearly 30 Years.

The reduction has been effected through the introduction of increased and improved plant for manufacturing.

It is now generally acknowledged that this highly concentrated Manure exceeds all others in general fertilising properties and staying powers, thus rendering its money value at least double that of any other Manure.

It promotes a rapid, healthy, and robust growth to plants generally.

It is a clean and dry powder, with very little smell.

It is consequently particularly adaptable for Amateurs equally with Nurserymen.

Sold in Tins of increased sizes, 6d., 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each; and in Kegs (Free) at the following greatly reduced prices:—28 lb., 10s. 6d.; 56 lb., 18s.; 112 lb., 32s. each.

SOLE MANUFACTURERS:
CORRY, SOPER, FOWLER & CO.
(LIMITED), LONDON.

Sold by all Nurserymen, Seedsmen, and Florists.

PAULS' NURSERIES, WALTHAM CROSS, HERTS.

THE "STANDARD" GLASS SHELTER.

(BUTT'S PATENT).

The principal feature in this system is the invention of standards to be set up in the ground across the rows of vegetation, and shaped to receive the ends of the glass, thus avoiding the necessity of its attendant bulkiness, shadow, and heavy cost, which have been found in such objectionable features in the hand-lights and other coverings hitherto used. The "Standard" are made in two sizes, the cover given by the smaller being 11 inches in width, and the same in height; and by the larger, 17 inches in width and 18 inches in height, and are made in the above diagram. Suitable provision is

length may be formed by the use of the required number of Standards as shown in the above diagram. Suitable provision is made for closing the ends of the rows with glass, and for dividing a long row into several compartments.

Cheap! Portable! No Shadow! Facilities for Hardening Off!

Prices: Standards (without glass), small size, 1s. 3d. each. Large size, 1s. 10d.

To be obtained from all Seedsmen and Ironmongers throughout the Kingdom.

Sole Wholesale Agents:—

OSMAN & CO., 132, Commercial St., London, E.

Unable to obtain a supply from your Local Tradesmen, send cash to Messrs. BUTT & SONS, Trafalgar Lane, Brighton, who will execute such orders, and forward Descriptive Circular free on application.

They have all been grown on the Derbyshire hills, and are hardy and strong. Carriage free. Cash with order. Descriptive LIST, 3d. free to customers.

CHRYSANTHEMUMS.—Special culture, not a collection of old-fashioned sorts, but the cream only of the best English, French, American, and Japanese raisers, including the very latest novelties. Good well-rooted plants, 12 for 2s.; 25 for 3s. 6d., warranted true to name; 12 varieties, all new of 1888 and 1889, for 4s.

PANSIES.—A great Speciality. Five Silver Cups, and other Prizes. The cream only of the most noted raisers, the latest new sorts, and the winners at all the great shows. Good plants, correctly named, Show or Fancy, 12 for 2s.; 25 for 3s. 6d., free. Also Seed, 1s. and 2s. 6d. per packet.

PILON, special culture, the cream only from Downie, Laird & Sons, Kirkcaldy, Warr, and other first-class growers. Six fine varieties for 2s., 12 for 3s., true to name. Strong stools, to bloom well.

CARNATIONS, PICOTEES, and CLOVES.—Strong layers, to bloom well, finest named varieties, 12 distinct colours for 1s., 25 for 2s. 6d. Also Seed, 1s. and 2s. 6d. per packet.

CANTERBURY BELLS.—Grand new colours and new forms, double and single, telescopes, cup and saucer, and other varieties, 12 for 1s., 25 for 2s., 50 for 4s. Also Seed, 6d. and 1s. 6d. per packet.

THE BEAUTIFUL PURE WHITE and PINK MALVA MOSHATA, &c., of the best hardy border plants in cultivation. Strong 1-year-old plants, 12 for 1s., 25 for 2s. 6d., also Seed, 6d. and 1s. per packet.

HOLLYHOCKS.—Warranted all fine double-flowered, Chester's subject strictly. Strong year-old plants to bloom well, 12 varieties, 2s.; 5 varieties, 1s.

POLYANTHUS and PRIMROSE Hybrids. Splendid mixed colours, finest in cultivation, 12 for 1s., 25 for 2s. 6d.; 100, 9s., all good 2-year-old plants. Also Seed, 6d. and 1s. per packet.

HYACINTHUS CANDIDANS.—A really fine and stately hardy well-covered border plant. Six flowering bulbs for 1s. 6d., 12 for 2s. 6d.

DELPHINIUMS.—In all the colours found in this deservedly popular class of border plants. Strong plants to bloom well, 6 for 1s., 12 for 2s., 6d., free. Also Seed, 6d. and 1s. per packet.

FOXGLOVES.—Gloxinia flowered. Dean's grand new large spotted, and 14 pure white varieties, 12 for 1s. 6d.; 25, 2s. 6d. Also Seed, 6d. and 1s. per packet.

SWEETLY-SCENTED, PURE SNOW-WHITE PINKS, quire beds, 12 for 1s. 6d., 24 for 2s. 6d.

CARNATIONS, PICOTEES, and CLOVES.—Strong year-old plants, from finest varieties only, including many new sorts, 12 in total varieties for 2s. 6d., 6 for 1s., 100, 15s.

FANCY PANSIES. Financed, 12 for 1s. 9d.; 25 for 2s., 100 for 10s. All 1st and first class sorts.

THE NEW DOUBLE SCARLET GEM. A hardy free bloomer, strong two-year-old plants, 12 for 1s. 6d., 25 for 2s. 6d., 100 for 10s. per packet.

AURICULA (Alpinus). A splendid collection from Strain plants, 25 in all, most beautiful colours and sweetly scented, 12 for 1s., 25 for 2s. 6d., Seed 6d. and 1s. per packet. Also AURICULA, the real old Irish Dusty Miller, sweetly scented, 12 for 1s. 6d., 6 for 2s. 6d.

THREE WHITE GEMS, CAMPANELLA PRINCESTOLIA, Single White, Double White, and cup and saucer, all quite hardy and unrivalled for cut flowers, 3 of each for 2s.

THREE WHITE HARDY BEAUTES GNAPHALUM LAXATUM, everlasting, best for years after being cut. IBERIS CORDELLIA, evergreen, and pure white flowers; AQUILEGIA ALBA, the largest pure white, each for 1s. 6d., 2 each for 2s. 6d.

TOMATOES. The best sorts in cultivation. See Catalogue, Great Tomatoes, 1s. 6d. per dozen.

TWO GEMS, PRIMA LEOPTOSIDES and PRIMA CASSIMEDIA, 2-year-old plants, say it would be difficult to find more beautiful plants for the Rockery, Borders, or Greenhouse than these, 2 each, 1s. 6d.; 4 each, 2s. 6d. Also Prunella Sibtholpiana, the Queen of Prunellas, Gange's International Prize, 3 distinct varieties named for 2s.

12 HARDY PERENNIAL BORDER PLANTS (nearly) distinct and useful for decoration and cutting purposes, for 2s.

12 VARIETIES of SHOWY, Free-flowering, and other WINDOW PLANTS (named), for 2s.

NEW STRAWBERRY, NOBLE (Laxton's).—This is, without doubt, the earliest, handsomest, largest, and best Strawberry in cultivation; 12 fruiting plants for 1s. 6d.; 25 for 2s. 6d., 100 for 7s. 6d.

STRAWBERRY PLANTS.—Selected Crowns for fruiting this year. British Queen, Pauline, Sibron, Vicomtesse H. de Barry, Duke of Edinburgh, King of the Fairies, Sir Harry, Dr. Hogg, President, The Sultan, and other new and extra sorts, 12 for 1s. 6d.

S. SHEPPERSON, Florist, BELPER

As a Supplement TO THE GARDENERS' CHRONICLE

FOR Next Week, April 19, WILL BE Published on Ink Photograph OF A VIEW IN THE PLEASURE GROUNDS AT MENTMORE.

THE Gardeners' Chronicle.

SATURDAY, APRIL 12, 1890. MALTESE GARDENS.

MALTESE gardens, like Maltese fields, are all walled in, and mostly very small. Earth is a scarcity, for little of the virgin soil of Malta and Gozo, when these islands formed part of the continent, has escaped denudation. All that can be extracted from crevices and caves is utilised; some small quantity only having been brought from Sicily and elsewhere during the reign of the Knights as ballast, the rest consists of the decomposition of the limestone rocks itself, of which the islands are entirely composed. There is an interesting example of one of the caves alluded to in a garden now belonging to Captain Price (formerly of H.M.S. Cyclops), which was constructed by the previous owner, Mr. Frere. When he had excavated the earth from what appeared at first to be a superficial fissure, he discovered that it was a "swallow-hole," as such is called in Derbyshire; and when all the earth was cleared out, it was found to lead to an ancient subterranean watercourse, 63 feet deep. That being now the level of the sea, it could not be traced further, as the water came in through the fissures in the limestone. The sides are water-worn, and show clearly that it was a place where, in former days, a river plunged headlong down, and then ran underground; just as often occurs in limestone countries, such as Derbyshire. Ferns and other plants now clothe its sides, affording a curious and interesting feature in the garden.

Mr. Harry's garden, at St. Julian's, and Capt. Price's, at Pietra, are, I believe, the largest gardens in the island, excepting, perhaps, that of the Governor's summer residence at San Antonio; but for picturesque quality they are unsurpassed. Mr. Harry's consists of at least fifteen separate portions at different elevations, divided off by walls or terraces, the largest of which is shown in fig. 99. The Rose garden is, perhaps, the largest, being about 60 by 40 feet. One of

more of the "gardenettes," to coin a convenient term, as also in Captain Price's, are devoted to the cultivation of Mandarin, Blood, Egg, and other kinds of Oranges, Lemons, white Nectarines, Loquats, and Almonds. All the walls, ranging from some 3 to 15 or more feet in height, are covered with purple-flowering Bougainvilleas, Tritomas, Passion-flowers, the blue Plumbago, Pelargoniums, Ficus repens, and Ivy.

There are many interesting trees and shrubs in both gardens; as, for example, in Mr. Harry's there is a very old India-rubber, *Ficus elastica*, its many branches growing to a great height. It is situated at the end of the long terrace, which terminates in a little paved court. An ancient well stands on the opposite side, at a distance of 30 feet (fig. 67). The roots of the Ficus have, nevertheless, discovered it, for they have spread under the paving seen in the foreground, and intercalated themselves into the sides of the well into which they have then descended.

In another of the gardenettes is a large *Acacia* from Australia and a *Casuarina* (fig. 68), which was planted in 1872 as a seedling. It is now about 26 feet high, the circumference of the base of the trunk being 30 inches; and at 4½ feet, 21 inches; a fair growth for seventeen years.

In another part of the garden is a "blue Hibiscus" (II. Patterson) at least 30 feet high, and a handsome *Wigandia*, which, like the Ficus, is diving under the walks and walls, and sending up young trees in unexpected places.

One does not expect to see much bloom in the depth of winter, but the reader would be surprised to see the dense masses of blossom upon yellow Cassias, scarlet *Bignonia radicans*, and its yellow ally, *B. stans*, as well as the *Trompe de Jument*, the large white double *Datura*. Lastly, *Bougainvilleas* exhibit dense masses or sheets of purple on the walls. The Rose garden, which would now have been full of blossom, had not there been a very prolonged drought in Malta last autumn, is bordered on one side by a row of great variegated *Agaves*, the low wall being covered with masses of *Sempervivum arborescens*, which now grows almost spontaneously in Malta, having been introduced probably more than sixty years ago. It bears trusses of golden-yellow flowers, nearly as large as that of the Horse Chestnut; the foliage is in terminal rosettes. *Poinsettias* grow 12 feet high, with a profusion of scarlet leaves, and fine varieties of *Crotons* and *Bilbergias*; *B. Leopoldi* being in blossom, brighten up the stone corridors and passages, where freely-growing *Adiantums*, *Aspleniums*, and other Ferns, form a perfect bowler for the visitor to walk through. One corridor, the entrance to Mr. Harry's house, is at least 100 feet long, with Ferns to the right, Ferns to the left, and Ferns suspended overhead; as well as *Palms* and other plants. The method of growing *Adiantums* outside earthen vessels is a favourite one in Malta; the globular vessel is very porous, and kept full of water. On the outside are fixed lumps of clay, upon which the Fern roots are fastened; they soon clothe the whole with a luxuriant mass of foliage. We have figured one of these "chatties," as they are called, as an example (fig. 71, p. 461). At each end of the long passage mentioned, stands a fine plant of *Philodendron pertusum*, with its curiously perforated and slashed leaves. *Apropos* of this, on an occasion when the corridor was illuminated, and lamps were placed behind the *Philodendrons*, a guest *naively* remarked, to Mr. Harry, "What trouble it must have been to cut out all the holes in the leaves to let the light through!"

Another remarkable plant is a brick-red coloured *Bougainvillea*, the only specimen in the island, which Mr. Harry received from Madagascar. A fine *Cycad*, with its spreading foliage, around which *Myrsiphyllum asparagoides* (a great favourite in Malta, and used in decorations of the dinner-table),

had grown, formed a pleasing combination. The borders were bright with scarlet *Salvias*, *Lavandula spica*, *Polygala Chamæbuxus* just coming out; while several large trees of white and rose-coloured Almonds are in full bloom at the present date (January 25).

On the limestone rocks are *Cacti* and *Mezembryanthemums* covering many square yards, including the indigenous "Ice plant," *M. crystallinum*. In one "wild" corner is a cluster of the tall stems of the native *Arundo donax*, a mass of *Arum italicum*, and the so-called English weed, *Oxalis cernua*, with its bright yellow flowers, the trifoliate leaves carpeting the ground, while cultivated varieties of the native *Narcissus tazetta*, now in full bloom, were abundant. *Palms* are not abundant in Malta, though the dwarf Fan Palm, *Chamærops humilis*, is pretty frequent in gardens; while two lofty Dates furnished the name to Mr. Harry's house as "The Palms." It is not generally cultivated, as it will not furnish edible fruit in the Island.

One remarkable tree known as *Zinzilla* (*Zizyphus*), bears curiously gouty twigs to its branches, and although it bears plenty of fruit, Mr. Harry says that it invariably falls prematurely if stones be not wedged in at the forks of the branches; when this is done, the fruit ripens. He has frequently tested this curious fact, and can vouch for its truth. The only interpretation which seems feasible is, that the stones in some way impede the circulation, but it is not clear how this is effected.

Mr. Harry is not without his Fig trees, so common in Malta, but to see tall branching trees devoid of leaves, as it is midwinter, some 15 feet high, clothed below to some 8 feet with scarlet *Pelargoniums* in full vigour, presents a curious contrast.

I must not conclude without a tribute to the owner's great liberality, for though he delights in his flowers without, and, I may add, his extensive and valuable collection of curios within his house, his friends, and the writer included, well know how often are their drawing-rooms brightened by a floral display, which at once betrays their source at St. Julian's. At this moment our own tables have upon them large sprays of white and pink Almonds, Irises, *Pelargoniums*, Tea and other Roses, bunches of yellow Cassia and scarlet *Bignonia*. Accompanying them are the following wild flowers, which I have gathered from the rocky valleys on the south side of the Island: bunches of *Erica multiflora*, *Narcissus tazetta*, *Rosemary*, *Asphodelus ramosus*, *Orchis fusca* and *saccata*; while the fields, &c., have furnished the scarlet *Adonis cupaniana* and purple *Anemone coronaria*, the pink *Silene sericea*, and the yellow *Chrysanthemum coronaria*. *George Henslow, Malta, January 25.*

(To be continued.)

NEW OR NOTEWORTHY PLANTS.

BARLERIA INVOLUCRATA, NEES, var. *ELATA*, Clarke.*

This is a fine addition to our soft-wooded stove plants, and is larger than either *B. Mackenii* or *B. Gibsoni*. The plant is a native of the Nilgherry mountains, but has, I am told, been introduced by Messrs. J. Veitch & Sons from Singapore.

Dalzell states that this plant grows to a height of 6 feet, and "when in flower has a very showy

* *Barleria involucrata*, Nees, var. *elata*, Clarke in Hooker, *Flora of British India*, vol. iv., p. 486. *B. elata*, Dalzell in Hooker, *Kew Journal*, vol. iii., p. 227. The stems are herbaceous and branching, with an adpressed pubescence. The leaves are 4-9 inches long, and 1½-3 inches broad, elliptic-lanceolate acuminate, and tapering into the petiole at the base, so that the upper part of the petiole appears winged; both sides have a scattered pubescence. The flowers in well developed plants grow in large terminal panicles of several flowered cymes, with linear-lanceolate bracts. The two outer calyx lobes are ovate-lanceolate or lanceolate acute, the two inner ones being much smaller. The corolla has a tube 1½ inch long, dilated at the upper part, and five broad spreading lobes rounded at their apex, the diameter of the flower being about 2½ inches, and of a fine deep blue colour, darker at the throat.

appearance." If it can be successfully cultivated so as to make a well-developed inflorescence, such as the wild specimens show it to be capable of producing, then I think it will be a grand stove decorative plant, and one that will be much admired. *N. E. Brown, Kew.*

PAULOWNIA FORTUNEI, Hemsley, n. sp.

Among the many interesting dried plants sent to Kew by Mr. C. Ford, the Superintendent of the Hong Kong Botanic Garden, are excellent specimens, both in flower and fruit, of what proves to be an undescribed species of *Paulownia*. Not that it was quite unknown, as Fortune collected flowering specimens of it without leaves. There are two such specimens in the Kew Herbarium—one from the Benthamic collection, labelled *Paulownia imperialis*, Fortune, China, n. 46; and the other from the Hookerian collection, from the same source, numbered 48. The latter specimen, consisting of three flowers and the otherwise naked axis of a large panicle, was described by Seemann (*Journal of Botany*, 1867, p. 373), under the name of *Campsis Fortunei*. In the periodical cited, Seemann revived Loureiro's genus, *Campsis*, for *Tecoma grandiflora* (syn. *Bignonia grandiflora*), a native of China and Japan, including in it the plant under consideration, the North American *Tecoma radicans*, and two or three Malayan species.

I have followed Benthamic and Hooker in retaining *Paulownia* near the arboreous, or shrubby genera, *Brookia*, *Wightia*, and *Brandisia* in the *Scrophulariaceae*; and it was not until I reached the *Bignoniaceae* for the *Index Floræ Sinensis*, that I discovered a name had been given to Fortune's plant. The genera named form a connecting link between the *Scrophulariaceae* and the *Bignoniaceae*, and it is difficult to determine the natural order of imperfect specimens of this affinity; hence it is not surprising that Seemann did not recognise Fortune's specimen as a *Paulownia*.

In the dried state the flowers of *P. Fortunei* are so much like those of *P. imperialis*, that the late Dr. Hance, who had specimens of the former from Chefoo, confused them.

So far as I know, *P. Fortunei* has only been observed, or at all events collected, in the two distant provinces of Kwangtung and Shantung, the actual localities being separated by about 15° of latitude. I have seen specimens of *P. imperialis* from Ningpo, which is situated on the coast about mid-way between the two places where *P. Fortunei* has been found; and Dr. Hance collected it in the central province of Hupeh, where, he notes, he observed it wild in various mountain localities.

Paulownia Fortunei is readily distinguished from *P. imperialis* by its much elongated, heart-shaped, long-pointed leaves, glabrous and almost shining on the upper surface, with a very short and very dense whitish tomentum on the under surface. The flowers are longer and more curved; but I have no definite information of the colour. The seed-vessel, too, is much larger than that of *P. imperialis*, as figured by Siebold and Zuccarini; but I have not seen a ripe one of the latter.

It is surprising that these two species should so long have been confused, though this probably would not have been the case had the common one proved a satisfactory ornamental tree in this country, and developed its full beauty. *P. Fortunei* produces its flowers early in the season, before or at the same time as the leaves; therefore we cannot hope that it will prove more suitable to our climate than *P. imperialis*. A fuller description will appear in the next part of the *Index Floræ Sinensis*. *W. Botting Hemsley.*

MR. GLADSTONE AT WEYBRIDGE.—We are informed that the veteran statesman, when on a visit to Admiral Egerton last week, was taken by his host to see Mr. G. F. Wilson's garden. He evinced much interest in what he saw, admiring the flowers greatly, especially the Oakwood Blue Primrose, that attracted so much attention at Westminster on Tuesday last.

THE DAFFODIL KING.

There will be few, if any, who will be disposed to question the right of Mr. Peter Barr to this designation. Previous to his accession, Daffodils were few in number. Gerard and Parkinson and Dr. Hill [Hale's Eden] knew a few varieties. Later on Haworth entered the arena. Dean Herbert, whose

has taken it up with the indomitable zeal of an enthusiast. Putting commercial considerations on one side, as of secondary importance, he, though a man of business, has allowed himself to be governed by his love of Daffodils, and has spared neither labour nor money in their collection. He has made long and tedious journeys in rough countries in quest of his favourite plants. On these occasions

made at the several spring exhibitions, should remember with gratitude the name of Peter Barr. It is he who created this now vast trade, it is he who stimulated it, it is he who has added so much to our enjoyment, and at a cost which permits the masses to share the delight with their wealthier neighbours; it is he who is constantly enriching our stores with new varieties raised by himself, or obtained from other sources. Others, besides himself, are now engaged in the trade, and are worthily following in his footsteps. Far be it from us to disparage them, or to draw invidious comparisons. We simply note the fact that Barr was the first in the field, and that to his energy and zeal we owe the present vast extension of Daffodil lore, and the corresponding enhancement of love for the Daffodil. We do not know where Mr. Barr's library may be—that he has access to one is quite obvious, for he quotes Parkinson and Gerard, Haworth, Herbert, and Baker, as if he were quite familiar with what they have written on the Daffodil. But, wherever his library may be, or whatever use he may have made of literary material, it is quite certain that the plants themselves have formed the main study of his life; printer's ink and type have been useful accessories, but constant study in the field has been the chief source whence he has derived his knowledge. In spite of the now extremely numerous varieties of Daffodil and Narcissus (we may, for our present purpose, use the terms indifferently), they admit readily of being classed under some dozen groups. These groups may be called subgenera, or species, or varieties, according to the judgment of the observer. It matters comparatively little whether Mr. A. considers this group important enough to be called a subgenus, while Mr. B. estimates it at specific rank only. What is of importance, is to be able to distinguish the group, and leave fanciers or students to give precedence and rank to the several groups according to their individual judgment.

Mr. Barr works upon a plan which every botanist adopts as far as he is able—he endeavours to discover the original types—the starting points, that is, of all this variation. Keen observation and constant comparison enable him to do this with a degree of certainty that no mere casual student or amateur could hope to attain. Wanderings in Spain, the Pyrenees, and in the Riviera have enabled him in many cases to hunt his quarry in its original fastnesses, and thus to bring to light the originals of some of the garden forms, so that now in walking through his quarters he is able to say of such a form—this must be of Spanish origin, that of Italian extraction, and so on. From Bayonne to Galicia, says Mr. Barr, all the Daffodils are sulphur-coloured. In Galicia bicolor forms are found; then come yellow forms all round the coast as far as the Portuguese province of Estramadura. Daffodils of Italian origin may be recognised by the fact that they are apt to be thin in substance as compared with others.

Researches of this kind have interest not only for the botanist but for the historian also—a singular illustration of the fact that the student of one department of knowledge cannot afford to disregard the evidence supplied by another.

Certain varieties, for instance, have lately been found in Irish gardens. The Narcissus now known as Henry Irving, turned up unexpectedly in a Dutch garden, where it must have existed for many a generation unheeded. Golden Spur had a similar origin. Whence, and how came these varieties? They must have existed in Ireland or in Holland, as the case may be, for generations; and the natural inference is that they were introduced into those countries by means of ecclesiastical or military travellers from Spain or Italy. But, says Mr. Barr, in answer, if this suggestion were correct, we ought to find the originals still wild, or, at least, in cultivation in Spain or southern Europe, but it is not so. This, of course, opens up the question whether they may not, indeed, have had the origin supposed, but have become modified in course of time in their new location. At least, this is a plausible supposition,

FIG. 67.—WELL-HOUSE MR. BARR'S GARDEN, ST. JULIAN'S, MALTA. (SEE P. 115.)

merits as a botanist are better appreciated by his successors than they were by his contemporaries, experimented with them. Leeds and Backhouse and Nelson won repute as hybridists. But in spite of these labourers, those who can look back twenty or five-and-twenty years will remember that the sorts then generally known and cultivated could be counted by units, whereas scores or even hundreds would now be required. What originally induced Mr. Barr to take up the subject we do not know; certain it is that he

his couch has not seldom been the rock, the sky his coverlet. Nor has collection been his only aim. Study of their peculiarities has been, and is, a perfect passion with him. Observation and research are continually increasing his store of knowledge, for truly nothing relating to Daffodils is foreign to Mr. Barr.

Those who see the fields of Daffodils in the neighbourhood of London, inspect the piles in the markets or in the florists' shops, or admire the displays

one that some people would pass by as insoluble, and others treat as a matter of indifference. Mr. Barr, however, would, we are quite sure, not consider any Daffodil problem as absolutely insoluble; still less would he treat it with indifference.

The Daffodils with their trumpet-shaped flowers and large coronas or crowns, the Narcissus with their flat flowers and shallow cups vary in stature, colour and form of the parts of the flower. There is the green ovary or young seed pod, which in some flowers is cylindrical, in others obovoid with the broad end of the egg uppermost, in others angular. Surmounting this is the perianth tube, long, slender, cylindrical, or slightly dilated upwards, greenish or yellowish in all the Narcissi proper, broadly funnel-shaped, and relatively short in the true Daffodils. Then comes the limb of the perianth with its six lobes broad or narrow, blunt or pointed, white or of various shades of yellow, spreading or directed forwards. In the centre is the cup or corona, short and shallow like a saucer in the true Narcissi, yellow or orange—especially at the edge, often more or less folded, while in the Daffodils or Trumpet Narcissi the corona is as long as the segments, or nearly so, broadly tubular, of various shades of yellow or orange, but generally darker in shade than the segments themselves. The free margin of the trumpet is regularly or irregularly lobed, and more or less reflexed. Notice should also be taken of the relative length and position of the stamens and styles, and of the periods at which they respectively become mature. All these peculiarities, and many others that might be mentioned, are familiar to the botanist, and are detailed in the works of Baker and Burbidge, but it may be of service to the amateur to indicate where he should look for differences between his favourites.

Mr. Barr's study is situated at Thames Ditton, a few miles from Richmond and Kingston, and easily reached from those towns or from Surbiton. It consists of some 15 acres of flat sandy loam, such as is found throughout the Thames Valley, and this area is largely devoted to Daffodils. Other plants there are—Anemones, Muscaris, Primroses, Paeonies, Lilies, and so forth; but just now the main attraction centres in the Daffodils, which occupy the greater portion of the ground. While other cultivators grow some dozen or twenty varieties at most, Mr. Barr is not satisfied with anything less than a complete representation of the genus. Hence, we find the Hoop Petticoat Narcissi, the triandrus group, the cyclamineus series, the big Daffodils, the little Daffodils, the least Daffodils, the bicolor Daffodils, the cernuus contingent, the incomparabilis tribe, the odorus section, the rugulosus set, the tridymus clan, the poeticus breed, the polyanthus and Tazetta hordes, all as fully represented as possible; and then who shall number, much more describe, the infinite variety of hybrids and crosses, the Leeds mixtures, the Barri bleedings, the Burbidgei combinations, and the Bernardi amalgamations.

Mr. Barr, by long practice, pronounces judgment upon the supposed parentage of these crosses. In some cases, the correctness of the affiliation is obvious to an unpractised eye, but in others we require to be shown, and even then the unpractised eye fails to grasp the points which seem so obvious to the King of the Daffodils. His majesty even goes so far as to trace in the hybrid something of the character of the raiser. This may sound far fetched, but if one thinks of the scholarly, sensitive, refined experimenter, and of the uneducated, rough-and-ready cultivator, it is easy to see that though both may be working for a common aim, their methods are likely to differ, and the results correspondingly to be diverse—alike in principle, modified in detail.

All this and much more we pick up from Mr. Barr as he conducts us round his quarters; we rapidly note the main differences in the colour, form, and size of the perianth; specially are we struck with the variations in colour and breadth of the "grass," or foliage. Clearly the leaves would afford an excellent field for research, and we have no doubt whatever that a clue to the solution of some of the

Daffodil problems we have alluded to would be afforded by a careful microscopic scrutiny of the leaf-structure. But who is to do it? we ask ourselves in despair, as our guide thrusts into our cab, as we are leaving, a big sheaf of varieties, with their fluttering labels attached, as numerous as the bits of paper in the praying wheels of the Tibetan priests.

Ah! there it is—the old story; there is so much to be learnt, so few to learn—so little time or opportunity, so much other work that must be done. Even the king admits that he is occasionally beaten by circumstances, and if that be so with him, a *fortiori*, it must be so with humbler individuals. At any rate, we are obliged to hold our hands, and to defer any special notice of particular varieties till another occasion; but let all who wish to know something more about Daffodils than they can learn from the exhibition table follow our example, and betake themselves to Thames Ditton, and pay homage to the Daffodil King.

PLANTS IN FLOWER AT KEW.

THE following are noteworthy amongst the plants now in flower in the houses at Kew:—

CRINODENDRON HOOKERIANUM (Temperate-house).—A Chilean plant, which is now rare in cultivation, although Messrs. J. Veitch & Sons introduced it many years ago. It is said to form a tree 20 feet high, but in cultivation it is a compact shrub, with horizontal branches clothed with Bog Myrtle-like leaves and drooping axillary flowers. These are very ornamental, as they hang singly on stalks 3 inches long, and are not unlike the flowers of *Clematis coccinea* in texture, form, and colour, except that they are smaller, and coloured uniformly bright crimson. Probably this plant would thrive out-of-doors in the warmer parts of this country. The Kew example is 18 inches high, and bears twelve flowers. There are two species of *Crinodendron*, both of them Chilean.

Rhododendron scabrifolium (Temperate-house).—This is one of the Yunnan species, and is the first to flower in England. It is erect, unbranched, 2 feet high, clothed its whole length with scabrid, hairy, oval, acuminate leaves, $\frac{2}{3}$ inches long, and bearing at the top a compact head of flowers, each $\frac{1}{2}$ inch across, almost flat, with rounded segments, white, faintly tinted with rose. In its present character it cannot be classed amongst first-rate garden Rhododendrons.

Randia (Gardenia) Stanleyana.—A plant 18 inches high, bearing ten flowers, has attracted much attention in one of the stoves. Although introduced from Sierra Leone by the Earl of Derby nearly fifty years ago, and long ago proved easy to manage, free in the production of flowers, and decidedly ornamental as well as distinct, this plant does not appear to find much favour amongst cultivators. The flowers are long, trumpet-shaped, 9 inches long, very fragrant, dark purple outside, white with purple dots inside. The limb of the flower is about 3 inches across.

Eucledia emiliens (Stove).—One of the most remarkable of the Capparidæ, and although not striking in the colour or form of its flowers, yet it is just the kind of plant to arrest attention and excite curiosity. It has flowered every year at Kew since it was introduced by Mr. Bull from West Africa in 1881. The plant is 18 inches high, and the leaves are trifoliate, bright green, deciduous. The flowers are in a large loose head on the ends of the branches; they are erect, with four green sepals and four petals, two of which are 4 inches long, erect, leaf-like, pale yellow, the other pair being scarcely a quarter of an inch long. The leaves are cast by the Kew plant late in the autumn, and it is then kept on the dry side until February. [An illustration from Mr. Bull's plant will be found in our columns on April 29, 1882.]

Rudaea macrophylla.—Several flowering examples of this fine Rubiaceous plant are now in the stove. When healthy, it rarely fails to produce in spring its dense heads of creamy-white fleshy flowers. On strong plants the leaves are 2 feet long, very stout

and leathery. It is a native of Brazil. [Illustrated in these columns, July 12, 1879.]

Cyrtanthus obliquus.—The largest and one of the most distinct of the Cyrtanthi, of which some twenty species have been found at the Cape. It has large, clustered bulbs, stout, leathery, glaucous green leaves 2 inches wide, and erect spaxes 18 inches long, each bearing an umbel of large tubular, curved, orange-yellow and green flowers, suggesting the flowers of *Blandfordia*. A specimen bearing five scapes of flowers is now in the Cape-house.

Peucephygium serpens is one of the prettiest of the Indian Whortleberries. It has a thick woody rootstock, from which spring long wand-like, arching branches clothed with stout bright green leaves, and bearing drooping axillary flowers, which are urceolate, 1 inch long, bright crimson, with darker veins. The leaves of the young shoots are coloured deep crimson. It is a pretty greenhouse plant, and may be seen in flower now in the Heath-house.

Heliconia crinitus (Cape-house), is not often seen, although an old garden plant under the name of *Arum crinitum*. Its large ovate spathe, 9 inches long, 6 inches wide, tawny-yellow in colour, shaggy, with reddish hairs on the inside, and the spinous-looking black-purple spadix are very remarkable, even for an Aroid. The odour emitted by the flowers on first opening is more powerful than pleasant.

Tuacarnum Warvingianum (Stove) is another large flowered tuberous-rooted Aroid, which resembles the *Arisæmas* in its habit of developing the leaf along with the inflorescence. This is pushed from the base of the leaf-stalk, and is 9 inches long, about half as wide, folded at the base; the colour outside is green with numerous lines of brown, whilst inside the colour is purple-brown. The flowers on the spadix are pale yellow.

Echium arborum is now grandly in flower in the Temperate-house. It is a giant Bugloss from Madeira, and is 10 feet high, nearly the same through, whilst the numerous leafy branches are each terminated by a large spike of rich blue flowers. H. H.

POTATO EXPERIMENTS.

We have been favoured from the Horticultural Division of the Rhode Island State Experimental Station with a report of some interesting experiments on the Potato crop in 1889 on the—

METHODS OF PLANTING AND TEST OF VARIETIES.

Much difference of opinion exists among Potato growers concerning the merits of the various methods of planting now practised, and the comparative value for production for market, and for home consumption, of the many varieties of Potatoes that are each season offered for sale for seed purposes. In consideration of these facts, together with a knowledge of the importance of the Potato crop as a source of one of our staple articles of food, this series of experiments was conducted with the object of solving, as far as possible, the following questions:—

1. Is the yield of an individual plant of Potatoes mainly determined by the space allotted to it in the row and the condition of the soil? or is it materially influenced by the amount of seed Potato planted?

2. Is the size of Potatoes influenced by the quantity of seed planted?

3. What varieties are best adapted to that particular soil and climate?

4. Are northern grown Potatoes better for seed than home grown?

5. What varieties are least subject to Potato disease?

The field used for the experiment was new land, the soil loam, with a yellow loam subsoil, and the natural drainage good.

A dressing of farmyard manure was spread broadcast, and turned under with the sod.

After being thoroughly harrowed, the field was furrowed out, May 9, into rows 3 feet apart. Before the Potatoes were planted, a manurial mixture, composed of muriate of potash and ground bone, was scattered and well incorporated with the soil by means of a cultivator. On the two following days, May 10 and 11, the Potatoes were planted, 114 different varieties, including eight duplicate varieties, that the products from seed grown in that latitude might be compared with the yield from seed of the

same kind grown further north. The experiment was divided into three sections as follows:—

a. Seed cut into single-eye pieces, and planted 9 inches apart in the rows.

b. Seed cut into two-eye pieces, and planted 18 inches apart in the rows.

c. Seed planted whole, 36 inches apart in the rows.

The weather being favourable, all the varieties came up evenly. The field was cultivated four times during the summer, and the soil was drawn towards the haulms twice with a hand hoe.

About July 20, during the hot wet weather that prevailed after the excessive rainfall of the month, Potato haulms blasted very generally throughout the State, and although many of the varieties in the experimental field were at that time in full blossom, they all succumbed to a common fate, the haulms dying and all growth ceasing before August 1.

The results obtained may be summarised as follows:—

Two-eye pieces, planted 18 inches apart, gave the best returns, the average yield by this method being more than 11 per cent. greater than with the single-eye pieces planted 9 inches apart, and nearly 28 per cent. greater than when whole Potatoes were planted 36 inches apart. The average proportion of small Potatoes was, however, this season, largest in the two-eye section, and slightly less in the one-eye section, than with the whole tubers.

As a rule, the heaviest tubers grew from the whole seed. The total yield varied considerably with different varieties. The average yield of the entire list was 513 bushels per acre. The five kinds giving the largest yield are, in the order of their productiveness, as follows:—

Thorburn	150 bushels per acre.
Bis's Triumph	...	100	" "
Early Tintian	...	70	" "
Chas. Bessing	...	88	" "
Webb's Early	...	51	" "

It is also a noticeable fact, that with the exception of Webb's Early, the proportion affected by Potato disease of the above-named five varieties was much below the average, the loss being but 2 to 3 per cent., while some other varieties show a loss from disease of from 11 to 17 per cent. of the total yield. *J. J. Willis, Hovepuden.*

ACCLIMATISED LETTUCE SEED IN INDIA.

In reading the account of M. de Vilmorin's lecture on "Plants for Salals," I was reminded of an interesting and successful experiment which I had made in India, in order to obtain good acclimatised Lettuce seed. Gardening in the plains of India labours under this difficulty. Vegetable seeds have to be imported either from Europe or America, because plants grown from Indian seed have a tendency to run to flower readily, and this tendency increases with every successive generation of Indian-grown seeds. Cos Lettuce, for instance, the first year gives very fine heads, but seeds kept from them next year produce plants that "bolt" before the head of the Lettuce is formed.

The following experiment succeeded admirably. The head of Cos Lettuce from imported seed was cut off close to the ground and eaten; only a few leaves were left on the stump. Side shoots from the axils of the remaining leaves soon appeared, and eventually ran up, and flowered, and seeded. The seeds of these next year gave as good results as could be wished. So, that by selecting plants that were well cabbaged at the top every year, and keeping seeds from their side shoots alone, a very satisfactory strain of Lettuce seed resulted. The heads required no tying, for the tops of the leaves overlapped each other, cabbage fashion, so that the inner ones were blanched, sweet and crisp. I found that Lettuce wanted rich loose soil, and plenty of watering. European vegetables can only be successfully grown in winter, in northern India, owing to the dry heat or damp heat in other parts of the year.

Recently a great deal has been written by Weissmann and others on heredity. He holds that no acquired character is transmissible, and that only such characters as are congenital can be inherited by future generations. It appears that this Cos Lettuce is a fair example of an acquired peculiarity becoming transmitted to its future generations. The imported seed from either congenital or acquired habits in Europe gives a slow-growing head the first year. But the influence of its surroundings in India is too much for it. They impress upon its nature a different character, which, in the second generation, produces a quick-growing head, and goes readily to seed without giving time for the inner leaves of the head to blanch. This latter character acquired, from its climatic surroundings, accumulates every successive generation, until the seed becomes useless for salad purposes. Now by cutting off the main stem, and allowing the side shoots to grow and seed, the original character of a slow-growing head is maintained in spite of the climatic surroundings.

I think there is a great deal to be learnt by experiments of this sort, both in biology, and the art of gardening. *E. B.*

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT CASTLE HILL, ENGLEFIELD GREEN.

It is with pleasure that we note the great improvements made in every department of the garden of G. C. Raphael, Esq., by Mr. W. Swan, whose prowess in the gardeners' art had for many years previously been recognised in the more northern counties. In connection with the Orchids is the name of Mr. Swan more generally known, but the condition of the different fruit and flower departments prove that he in no way allows his favourites to over-ride other and equally important subjects.

The *Phalaenopsis* and *Acrocymbium* at Castle Hill are looking remarkably well in the house arranged for them, and in which the plain earth floor, which Mr. Swan considers highly conducive to the health of all East Indian things, is left without tiles. Still affording a further surface of earth, beds like those used for planting *Cymbidiums* are planted with *Fittonias*, *Pleuras*, and other dwarf foliage plants, and over these the plants are suspended; evidence of profuse flowering is seen on all the specimens, some of the *P. Schilleriana* having six or seven branches. A fine form of *P. grandiflora*, and some *P. amabilis*, and *P. rosea*, were also in bloom, and with stout spikes; the pretty white *Angreicum Sanderianum*, *A. Ellisii*, and *A. citratum*.

Among the *Cypripediums*, of which a fine collection of large specimens exists, the nobly-formed *C. Swainianum*, one of the earliest and best of the garden hybrids, raised by Mr. Swan some years ago, stood out prominently, and on the same stage were *C. Dominicanum*, *C. Eozellii superbum*, a fine form of the *C. longifolium* type; several large *C. villosum*, *C. barbatum Warronii*, a very strong *C. bellatulum*, with two flowers on each spike; *C. Hookeri*, *C. Laxmannianum*, and most of the other species which flower at this season.

The *Dendrobies* were making a great display; some specimens of *D. Fendlyanum*, about 2 feet across, and bearing scores of blooms, being equal to, if not better than anything of the kind ever cultivated; *Dendrobium Wardianum* and *D. crassinobis* were also magnificently flowered; a plant of *D. e. Barbianum* having from thirty to forty flowers on each pseudobulb. Many specimens of *D. nobile* and one or two of *D. n. nobiliss* were making a rich display; and *D. crepidatum*, *D. capillipes*, *D. densiflorum*, *D. chrysoctenum*, *D. Pierardii*, and other old favourites, are well represented.

The *Odontoglossums* have chiefly the hybrid forms in flower; one fine *O. Andersonianum* had a six-branched spike, and *O. Lackerianum* was equally fine. Some good forms of *O. luteo-purpureum* and

O. cirrosum were in bloom, and *O. Hallii xanthoglossum* and many *O. crispum* and *O. Pescatorei*. Suspended overhead were plants in bloom of *Sophranitis grandiflora*, *Odontoglossum Cervantesii*, and *O. Rossii majas*, and *Masdevallias* of the *M. bella* and *M. chimera* section.

The *Cattleyas* and *Laelias* were observed in grand order, but with few at present in bloom; some flowers, however, are on the plants of *Cattleya citrina* and *Laelia cimbabarina*, whilst the specimens of *C. Lawrenceana* and *C. Mendelii* were grandly budded. Other specially noteworthy plants in flower were the rare *Cymbidium albiflorum* with several spikes, some *C. Lowianum*, and *C. eburneum*, a few large *Oncidium ampliatum majas*, the curious *O. phynatichilum*, the pretty crimson *Broughtonia sanguinea*, *Acriodes Houlettianum*, *Calanthe veratrifolia*, and with the *Orchids*, a splendid strain of *Anthurium Schotterianum*, and *A. Andreanum*.

In the other plant-houses, among a fine general collection of plants, were a perfectly cultivated and profusely-budded batch of *Gardenia*, another of *Lochnera amazonica*. Some fragrant *Daphne indica*, a finely flowered batch of *Lachenalia tricolor*, many charmingly-coloured *Azalea mollis*, several scarlet *Musa coccinea*, a batch of *Begonia nitida*, another of *Frossias*, some specimens of golden *Celsia*, and most things likely to give flowers at this season. Indeed, Mr. Swan's aim is to have them all the year round.

CALCIPEDIUM ELIOTTIANUM.

We find that this plant enjoys a good share of heat, and the East Indian-house is the best place in which to grow it. A liberal supply of water should be given when established, but care is required before it is established that no water is allowed to lie in the heart of the plant, as this is a great cause of decay. The plant is best cultivated in pots, and the side tables are most suited to its requirements, as in this position the plants are tolerably near the glass, which is essential, for it enjoys sun and light, and requires shading only during the hottest part of the day in summer. For soil, use a mixture of fibrous peat and turfy loam, the greater portion of the fine soil, however, being shaken away; to this add some sharp sand and medium-sized nodules of charcoal, to induce the plant to form strong and vigorous roots, and to produce healthy foliage. The soil should be elevated slightly above the pot's rim, in order to allow the water to pass away more readily, and also to allow the roots greater freedom. This species does not appear to propagate so readily as many of the kinds, but this may arise from the plants not having yet become thoroughly established, so that on this subject we are not in a position to offer an opinion. "*Orchid. Abou.*" t. 397.

DENDROBIUM BAYNERIANUM.

This species is free growing if its wants are supplied, and these are very simple. We find small baskets or pans to suit it best, although we have seen it thriving well in pots. The soil should consist of good fibrous peat (from which all the fine particles have been shaken), and living sphagnum moss; the drainage also must be maintained exceptionally free, as the plant cannot abide anything sour about its roots in potting or basketing. The material should be built up into a cone-like mound above the level, and not too much soil should be used; by this plan the roots of the plant can either penetrate the soil or ramble on the outer surface; this latter, many plants appear to enjoy. Large baskets are not necessary, as this plant does not require much soil about its roots; indeed, the less it has about them the better it appears to like it. The plant should be kept moist at the roots during the season of active growth, but when this is completed, all that is necessary is just sufficient water to keep the bulbs from shrivelling; for the drying-off system should not be carried to extremes. This plant is a native of Borneo, consequently we find the warmest house most genial to it; it should be suspended, say some 18 inches from the glass, and

very little shading given, even through the hottest part of the day in summer. A free circulation of air is essential, and the atmosphere should be well charged with moisture. "*Orchid Album*," t. 308.

DISA GRAMINIFOLIA

is a lovely species, and its thin grass-like foliage from which its specific name is derived, renders it very distinct; but the leaves are not developed with the flowers. The blossoms are of a charming azure-blue, with purple on the tip; they are arranged in racemes, and continue in bloom for a considerable time. This is a somewhat difficult plant to establish, and even when it becomes established, it requires great attention, in order to produce it in the perfection in which it is here laid before our readers. We ourselves have not much experience in growing this plant, but we gather that it grows well in a well-drained pot, and the drainage should have some broken bones added, as we consider this answers the same purpose as mixing manure with the soil, and it has the advantage of always keeping sweet and clean. The soil should consist of about equal parts of loam, peat, and leaf-mould, to which may be added some rough sharp sand, and some moderate sized nodules of charcoal, which greatly assist in keeping open the soil, which should be made firm about its roots. During the growing season a liberal supply of water is requisite, but care should be exercised to see that it passes away quickly; and in the winter, when at rest, the soil must be kept in a nice friable condition, but by no means allow it to become quite dry, for as Disas are found in a state of nature beside streams, on rocks, and in deep ravines, it becomes necessary to imitate the natural surroundings as near as possible. Slight shade is also necessary, for in their natural habitats they are surrounded with trees, which effectually break the sun's rays. This plant appears to have been introduced some sixty-five years ago; but we are not aware that it was successfully established. It has long been a coveted plant by Orchid growers, and now that it is established in our collections, we hope it may long continue. It is a rare and charming colour, and is most desirable in producing a distinct effect among other Orchids. "*Orchid Album*," t. 309.

FOREIGN CORRESPONDENCE.

BERLIN LETTER.

In my last letter (see p. 363), I said that horticulture could make much use of the results of the studies of botanists. I further mentioned that horticulture needed experimental stations. Botanical and physiological institutions, of course, have other fields of study than an experimental station would have, if destined for practical purposes. The scientific man has to study matters the knowledge of which would be of but little use to the practical man in most instances, although there are still a great many matters for study where that knowledge would be of the highest importance to the practical man; as, for instance, why do seeds of *Cratægus*, *Roses*, &c., germinate in the first year if they are stratified, but in the second and third if they are kept dry during the winter? How could these seeds be made to germinate all at once? Then there is another question: *Roses*, *Dahlias*, *Begonias*, and many other groups of plants give only red or white, never blue flowers; is it impossible to produce varieties with blue flowers, even if only by cultivation each year, as in *Hydrangea*? Or, what is the cause of fasciation? Fasciated Cockscombs are of great horticultural value. Is it impossible to grow other fasciated plants, *i.e.*, not to further develop fasciations which have arisen spontaneously, but to create artificial fasciations? It would be a matter of much importance to find a way to produce double flowers artificially.

These questions are examples of what would have to be answered in a horticultural experimental station.

Agriculture has availed herself of the analyses of plants that have been made. Is it not curious that the sister art, horticulture, has not made more use of them? True, analyses of garden plants have been made in great numbers, but horticulture has not generally noticed them. There is still another point to be remarked. The sums of money annually expended on seeds is enormous. In general the seeds, especially of the more common species, are of good quality. But there are sold every year seeds which are not worth the postage, and it would be part of the work of a station to test seeds with regard to their germinating power, purity (freedom from weeds), &c. A seed merchant would be able to announce that his seeds had been tested by the station. Lastly, I should like to hint at the part mentioned in Mr. Thiselton Dyer's communication "A Gardener's Problem," that plants reach under culture a perfection which much surpasses their growth in their natural position. As was truly observed by one correspondent, in Nature each plant has to fight against other plants, and it is, as far as possible, adapted to that position. For, if this were not so, it would succumb in the struggle. In cultivation it has not to fight, and finds such a surplus of nutriment that it would be wonderful if it did not deviate from the original form. A horticultural experimental station would investigate acclimatisation, and select plants suitable for vegetables.

If gardening is to make advances, it must go hand in hand with botany. Now the results of these experiments must be available to all gardeners, and the stations themselves, servants of gardening, must not be worked for the benefit of any one person, but for the progress of horticulture as a whole.

The correct way of solving a question by experiment is either by excluding all factors but one, or only one. The factors concerning plant life are light, heat, moisture, and food. To study the influence of light upon plants, all factors but light must be eliminated, or the light itself withheld in plant life; the latter is the only possible way, as the plant cannot possibly live by the aid of light alone. But it is also necessary to control the other factors, and to keep them in the same condition throughout the experiment. This is almost impossible in the open air. So for many experiments it is necessary that they be performed in closed rooms. Now light has a directing influence upon the growth of plants, inasmuch as that part of the plant which receives most light is of slower growth in length than the other parts. That is why plants are drawn to the windows when grown in rooms with side windows. A mirror placed behind a plant has a beneficial effect, but is rather troublesome sometimes; so a laboratory should have windows not too high. It would be best if a laboratory were built entirely of iron and glass for experiments relating to physical influences. It would be necessary sometimes to vary the moisture of air, and so it would be desirable to construct several compartments, in which this could be regulated.

Another set of experiments would concern chemistry, and for these a chemical laboratory would be required in which analyses could be made. But the conditions under which plants are cultivated in gardens and nurseries must be considered. So a hot-house, a few frames, and a piece of land must be provided. There must also be an arrangement to permit the plant's exposure to the open air, but, at the same time, protect it from rain. Lastly, an ice-cellar would be useful for many purposes. The following, then, is what is required: One structure of iron and glass, divided into several compartments, for physical experiments, a house containing, say four rooms, the chemical, the anatomical laboratory, the physiological laboratories of each one room; and in connection with this a verandah, where the plants could from time to time be placed in the open air. Then a hot-house, a green-house, several frames, an ice-cellar, and about 2 acres of land, also accommodation for the staff. The Director must be a man educated theoretically as

well as practically; he must be well-informed as to what gardening means: general botany, plant geography, and chemical and physical knowledge, he must possess—he it is who formulates the problems; under him are an analytical chemist, a physiologist; also a gardener with good theoretical knowledge, and an assistant, are necessary. As for a great many experiments observation during day and night are required, the whole staff should live at the station. The expenses of the station would by no means be low during the first year. A point of interest is, that I succeeded in obtaining dark blue *Primula sinensis*; sulphur-yellow *Cineraria cruenta*; a pale blue *Azalea indica*, and *Camellia japonica*, also a yellowish *Primula sinensis*. I feel I am on the right way to secure blue *Dahlias* and blue *Roses*, not as varieties or sports, but purely by cultivation! *Udo Danneberg*.

TRILLIUM DISCOLOR ATRATUM.

Permit me to elucidate the history of this plant, and to assure my friend "R. D." that there is no wilful manufacturing of name about it. If any one could be called guilty in this case it would be myself. The plant originally came from America to the Royal Botanic Garden, Berlin, and was labelled *T. discolor*, Wray. About 1873 it was received at Baden-Baden, and as at that time I was not the happy possessor of a complete set of the *Botanical Magazine*, I could not make a comparison, and cultivated it under the above name. I remembered well the beautiful plant at Berlin, and it seemed to me that the plant which M. Bouché was so kind as to send me was in its leafage of a darker and of a more sombre tint than what I had seen there, and having made a comparison, I added the word *atratum*. Mr. Peter Veitch, when visiting my garden, ordered some plants, and so it came to England. There can be no doubt that it is *T. sessile*, L., but the plant is a very distinct and beautiful variety of what is figured perfectly in the *Botanical Magazine*, and it is known that the leaves of plants grown in the open air are much darker in colour, and the blotches are of a sombre grey colour. Whether it be called *discolor atratum* or *sessile atratum*, I maintain that the plant in question is very distinct, and fully merited an award being given to it; and I am quite sure the just mind of Mr. D. would endorse this opinion, if I could have the honour of a visit, and show him a patch of this plant having leaves of more than 3 inches across. *Max Leichtlin, Baden-Baden*.

DAFFODIL FARMING.

WESTWARD of Richmond Park, on the low ground sheltered by the wooded slopes of that charming resort, lies Ham Common, a good specimen of an English common, though not so far off from the great city as to be beyond the jurisdiction of the metropolitan police. The common and its surroundings, and the adjacent village of Petersham, offer many temptations to dilate, but the inexorable limitations of space forbid us from doing more than allude to a farm, situated on the very edge of the common—a farm very unlike what we mostly understand by that name. It no longer pays to grow Wheat, and agricultural depression is a lamentable fact, the existence of which no one now denies. All honour, therefore, to the cultivator, who, recognising the nature of the situation, boldly turns his attention to other matters than corn-raising. The farmer, it is certain, must become more of a gardener than before; he must not only practice garden methods, but he must take a lesson from the gardener, and learn how to grow a larger variety of crops, grow them well, and not remain dependent on the indifferent cultivation of one, or on a few only.

"A Daffodil farm! What nonsense!" "Who ever heard of such a thing?" These would have been the exclamations ten or fifteen years ago, when all that was attempted in that way consisted of lines of the old double Daffodil, *Telamonius plenus*, between the Gooseberry bushes in the market gardens;

yet here is one of some 124 acres, mostly given up to Daffodils, and very pleasant is it to see the long rows of gay flowers, assorting in tint so well with the "grass." Seven rows and an alley, and then seven more rows, of the same or of some other variety—and for a distance of nearly a mile, these "breaks" stretch away to the right and to the left. Here and there fruit trees have been planted, intended to serve as wind-breaks, and, in due time, to furnish the markets with something to eat when the Daffodils have done their year's work, and are preparing for

Mr. Walker's repute in the horticultural world. Time after time has he shown at the Royal Horticultural Society and elsewhere examples of excellent cultivation, and set up with good taste and judgment. When we see the enormous amount of material he has at his command, the way in which the land is farmed, and the plants cultivated, and the care taken in gathering and bunching the flowers for market, we no longer wonder how it is done.

The land is mostly level, the soil a sandy loam, easily worked with a light plough, and the plants so

character; this is only what we find in any group of plants. What is more unaccountable, and more apparently capricious, is the fancy of the public, especially of the lady part of the community, for particular shades of colour.

Some of the many hybrids of the Leeds section at present satisfy this fancy for variations in tint, but who is to tell what will take the fancy of the public next spring? It would almost seem as if painters and decorators, *costumers*, and milliners, must be taken into sweet counsel by the gardeners, so that the latter may be able to furnish what "will go well" with the constructions of the former.

Again, some varieties, though very pretty, are of no use for market purposes; they are not "free" enough, they are not good "croppers," as they say of Potatoes; their colours are not decided, they hang their heads instead of looking one boldly in the face, they are thin in texture, they are too small, or they come in at a season when there are plenty of others, perhaps of better quality for market purposes. All these circumstances have to be taken into consideration in addition to those unaccountable whims and caprices of fashion to which we have already alluded.

The flowers intended for market are cut from the open field when the buds are about half expanded; they are placed in water in a Cucumber-house or similar-heated structure, where they expand, unburied by the casualties that may befall flowers that expand in the open air. From hence they are conveyed to a roomy, paved, well-lighted shed, where they are "bunched" by women, packed in boxes, and sent off over night for the early morning market. A peep into the houses, crammed with expanding flowers, or into the shed where they are being sorted and packed, affords one of the most remarkable sights that can be imagined. When the door of the shed is opened, there issues a perfume as of Araby the blest, whilst the floor and benches resemble one large mosaic of brightly coloured flowers—Daffodils of all shades, from pale lemon to deep orange; white Narcissi (*ornatus*), and deep red Van Thol Tulips. How bright and fresh they look now by contrast with their appearance in the florists' shops, and still more with their aspect when thrust into one's face by the slatternly flower-girl seeking to tempt us by her ill-fortunate cry, "penny a bunch!"

The Daffodil season after all is a short one, so that Mr. Walker has other strings to his bow in the shape of Tulips of all sorts, Lilies of the Valley, Wall-flowers, Paeonies, Dornicums, Irises, Day Lilies, Christmas Roses, and many other hardy flowers, the disposal of which at the market may be relied on.

In addition to these seemingly endless "breaks" of hardy flowers, culture under glass is also attended to. Tomatoes have been grown, and are so still to some extent, the plants being grown in the borders in light span-roofed houses. "Conference" is well spoken of, though it is not to be depended on out-of-doors, but Tomatoes are doomed to be supplanted by Peaches, for whose accommodation no fewer than eight light span-roofed houses have been erected, each 180 feet long by 21 wide, and 14 feet in height. The trees are grown in pots, and treated to scrapings of chamois leather by way of manure. For early work, Alexander, Dr. Hogg, and Hale's Early, are depended on. Then come in a second house Grosse Mignonne, Royal George, and Liver's Early York. These are succeeded by such sorts as Lord Napier, Nectarine Peach, Gladstone, Princess of Wales, and Sea Eagle. As an illustration of the minute points which are forced upon the grower's attention, it may be said that for market purposes, Sea Eagle is objected to, by reason of the little nipple-like process with which it, like some others, is provided. The reason is that this little projection is apt to get bruised and injured in packing or handling, and so the value of the fruit is deteriorated.

It is thus obvious that while Mr. Walker's establishment is not what is called a "show place," and indeed it is not desired that it should be, it is one where the professional visitor will be welcomed, and where he will find much to interest and even astonish him.

FIG. 62.—CASCALINA IN MR. HARRY'S GARDEN, MALTA. (SEE P. 118.)

the next season's campaign. Apples on the Paradise Stock, Lane's Prince Albert, and Bismarck, being favourite sorts. Pears on the Quince and on the free Stock. Among these are more than a thousand young trees of Fertility, a Pear which comes in for market use when the Hessele is over. A few Plums, such as Princess of Wales, are also grown. The variety mentioned always sells well, and comes in before the Victoria, but somehow the variety does not do well.

But the fruit trees at present are "great expectations" rather than accomplished facts, and it is the Daffodils we have come specially to see on this April morning. It is the Daffodil which has made

far apart that the soil may easily be stirred with a light "Planet" hoe. As to manure, the soil is a hungry one, but among the many peculiarities of the Daffodils that Mr. Walker tells of, is the difference between one form and another in the matter of manure. For some too much can hardly be given; others of more delicate digestion can hardly take any without evil consequences. In like manner some varieties when cut will grow in water, others will not. Idiosyncrasies of this kind will, no doubt, be pointed out in Mr. Walker's paper at the approaching Daffodil Conference at Chiswick. It is not surprising to learn that some varieties are "good doers," whilst others have no claim to such a

ENVILLE.

This demesne, called originally Evenfield, shortened to Enfield, and changed to Enville about the beginning of the eighteenth century, was one of the manors bestowed by the Conqueror on William Fitzansculph; and in the twentieth year of the reign of William I. it was held by one Gilbert. The heirs of this Gilbert seem to have assumed the surname of Evenfield, for in the time of Henry III. and Edward I. Richard de Evenfield was possessed of the manor. The family of Evenfield held Enville till the reign of Henry VI. when it was sold to the family of Lowe, of Whittington. Humphrey Lowe was sheriff of this county, 10th of Henry VI. and was returned among "the prime gentry of the county of Stafford." The principal residence was then at Whittington. The daughter and heiress of Humphrey Lowe, Eleanor, married Robert Grey, third son of Reginald, Lord Grey of Ruthin, and thus the manor of Enville passed into the family of Grey. Thomas Grey (who died 2nd of Elizabeth, and whose tomb is in Enville Church), built a house at Enville, and in Plots, Staffordshire, there is a view of the south front of this old house, dedicated to Harry Grey, Esq., with his arms and quarters. The above-mentioned plate in Plot shows the style of architecture of Henry VIII.'s time, having two lofty turrets at the entrance, and rich gabled ends, with ornamental chimneys on each side. In this state Enville continued till 1739, when Harry Grey, fourth Earl of Stamford, having purchased several estates so as to make the whole hill above the house and town his own property, and having married Mary, the only daughter and sole heiress of George Booth, last Earl of Warrington, by whom he had an immense fortune, laid out many thousand pounds in making the place beautiful! Dr. Wilkes says, "This he has done with as much art, and in so elegant a manner, that few places in England can rival, and none of the same compass of ground exceed it." The hall built by this Earl, with additions and alterations, is the one still standing. The poet Shenstone was a great friend of Harry, fourth Earl of Stamford, and laid out the woods and grounds at Enville. The church at Enville, dedicated to St. Mary, is an ancient structure, erected at different periods, and exhibiting various styles of architecture. The north aisle was founded by the Lutteleys in 1333. Philip de Lutteley, a parliament man and escheator to Edward III., had the king's licence to found a chantry in the parish church of Enfield to the honour of God and St. Mary, and for a priest to say mass every day at the altar of Our Lady there.

In 1270, Philip de Lutteley gave lands to the said Chantry for the priest to pray at the altar of St. Mary, for the health of his soul and Maud his wife, and of Sir Tulke de Birmingham, and of other benefactors recited in the deed. The church contains many interesting monuments. In the north side of the chancel is a stone coffin, with the recumbent figure of a priest sculptured on the lid. During the restoration this coffin was opened, and the skeleton of the occupant was found intact. There were faint traces of the robes, and the cup and paten lying by the right hand. The soles of the shoes, kept in their places by the bones of the feet, were in a perfect state of preservation. No inscription or date was found, but tradition says he was the founder of the more modern portion of the church, viz., the south aisle and chancel. There is also an alabaster altar tomb adorned with elaborate workmanship; the figures are of a knight and his lady. The knight is in his armour, his head resting on his helmet, and at his feet a lion; the lady is in the dress of the period, and towards her feet is a small dog catching hold of the folds of her robe. This is the inscription:—
"Here lyeth the bodies of Thomas Grey, of Enveld, esq., and Anne, his wife, daughter to Sir Raffe Verney, of Pendley, with in y^e countie of Bucks, Knight, y^e wyche Thomas died y^e last day of December in y^e yere of Oure Lorde, 1559, and y^e sayd Anne, died y^e day of . . . in y^e yere of Oure

Lorde . . . upon whose sowles God have mercy. Amen."

There are other monuments and monumental tablets to Henry Grey, grandson to Henry Lord Grey, of Groby, 1686; Harry Grey, Earl of Stamford, 1768; Lady Dorothy Grey, founder of the Girls' Charity School, 1781. The registers date from 1627, and contain many interesting entries, among them that of the marriage of the poet Shenstone's brother. During the years 1872-3-4 the church was thoroughly restored and beautified under the superintendence of the late Sir Gilbert Scott, and mainly at the expense of the late Earl of Stamford. It is now one of the finest country churches in the district.

The grounds at Enville are very extensive, and of a most charming character. A notable feature are the specimen Conifers 30 to 40 feet high, and also the fine specimens of Copper Beeches, whose branches spreading out, rest upon the turf; the pools and fountains should be mentioned. Every turn of the path opens fresh views to the pedestrian, and which have a beauty peculiarly their own. Through the kindness of Lady Stamford, the grounds are opened to the public two days in a week during the summer months, and thousands of persons visit the place each year.

The conservatory is a noble structure, built by Messrs. Gray and Ormson, about thirty years ago. It is now in capital condition, and is kept gay at all seasons; it is 180 feet long by 90 feet wide, the centre beds are planted with Camellias, which are of large size, and very robust, and flower well every year. There are also numbers of standard Bay trees, a *Chamerops excelsa*, 18 feet high; some grand *Dicksonias antarctica* with stout stems and fine fronds. In recesses at the sides are large specimens of *Azalea indica*, mostly *A. i. alba*. These plants are of pyramidal form, and measure 8 feet in height by 6 feet in diameter, full of growth, well set for flower, and promise in their season to make again a fine display. Large plants of *Acacia affinis*, a very useful species for cutting purposes is found; a number of plants of *Coprosma Baueriana variegata*, 4 feet high, and bushy withal, were placed among the other plants, enlivening the whole considerably.

Passing into the walled-in garden, where the greater portion of the glass is situated, attention is arrested by a Peach case of 365 feet in length, and in four divisions; three being devoted to Peaches and Nectarines, and one to Cherries. These trees produced splendid crops last season, and are full of promise for the present year. One of the Cherry trees measured 13 yards across.

Capital Muscat Vines and Lady Downes' are found in the vinerias, whose age is sixty years; the colour and finish of the fruit is always excellent. Pines, a specialty at Enville, and a number of houses were filled with them. In the various houses is to be found some of the finest plants of *Encharis amazonica* in the kingdom. These plants are always kept growing; they are carefully shaded during the bright days of summer, frequently syringed overhead, and very seldom shaken out of their pots. This treatment results in great vigour, in freedom from insect, and in quantities of flower-spikes at nearly all times of the year. In the stove were observed many fine specimens of the ordinary class of plants; clean-grown Crotons, Dracenas, and other fine foliage plants employed in house-decoration. Some beautiful baskets, 4 feet in diameter, filled with *Adiantum cuneatum*, whose fronds spread out all round; *A. gracillimum*, *A. Farleyense*, and others, were very large and full of fronds. Here, too, were noticed *Platyterium alcinorne*, an immense mass; and one of *P. grande*, originally placed in a shallow pan, which had grown so much that it encompassed the whole of the pan, and the barren fronds measured 5 feet across. The fruiting frond of this plant, so distinct from the former, was 3 feet 6 inches in length. A plant of *Anthurium Scherzerianum* was 5 feet over. A number of fine *Bouvardias* were in flower; and a quantity of *Clivias* were noted, which have a house to them-

selves. A span-roof house is set apart for small flowering plants in season.

Several houses are devoted to Orchids, and contain a number of the Manley Hall plants, which have now grown to large size. Many *Vanda tricolor* and *V. suavis* are from 3 to 5 feet high, and full of vigour and roots; *V. Batemanii* was in flowering, with a spike 5 feet long; *V. gigantea*, with twenty-four leaves. The *Aerides* are good; masses of *Cœlogyne cristata*, very large; *Dendrobium nobile* is still one of the most useful *Dendros*; *Cypripedium caudatum*, *Maxillaria venusta*, *Cattleyas*, *Oulotoglossums*, &c., were in good health, and some of them in flower.

Poinsettias are largely grown, as are also *Carnations*—the pure white *Queen*, *Nimrod*, *Miss Joffie*, *Souvenir de la Malmaison*, &c., being principally grown. *Veltheimia* in pots is found in great use. There are many other glass structures which space forbids me to mention.

Two walls of 170 yards in length and about 4 in height are covered with Pear trees, which are carefully looked after and well trained, and, doubtless, when in fruit are very attractive.

Bodding out is not carried on to the extent it was formerly, when Enville was far above most other gardens. My notes would be incomplete without mention of the kindness and courtesy of Mr. Green, who conducted me over the greater part of the gardens and grounds. W. S.

PLANTS AND THEIR CULTURE.

THE GREENHOUSE.—Plants of *Azalea indica* which have been forced should be encouraged to make a free growth and an early set of flower-buds. Weak gano water is of great assistance to old plants of *Azaleas* not often shifted, and Clay's Fertiliser is a good one for the purpose.

Small plants whose bloom is over, and which require to be repotted, should without delay be taken in hand, using plenty of clean crocks in the drainage and not overpotting them. Plants now coming into bloom will last longer if they are shaded from hot sunshine, and late bloomers should be placed in a house facing north so as to retard them. Camellias should be encouraged to grow freely, and if intermediate-house temperature can be afforded them and plenty of moisture, growth will be rapid. If planted out, frequent syringing of the plants should be carried out, and shutting up the house early in the afternoon. Hybrid *Rhododendrons* will now be making new growth. We grow ours in an intermediate house, and keep them well syringed from the bottom upwards, and not as is usually done; by so doing new growth is emitted freely by the old wood. Red spider and thrips sometimes infest them, but in a moist house these insects do not give much trouble. Rather small pots are best for these *Rhododendrons*.

Hybrid Calceolarias now throwing up their flower trusses, should get a few sticks to support them, and frequent supplies of water and weak liquid manure should be afforded the plants. If green fly be present at all, succession before flowers appear on the plants. Plants to bloom late should have a repotting (the last), and a place near the light, so that growth may be steady. Zonal *Pelargoniums* to flower late, will require to be shifted into larger pots and grown in a light position. Old stock plants cut back, shake out, and repot in a good compost, or their season of growth will be a short one. A good compost for these plants will consist of loam, and small quantities of decayed cow manure, and leaf mould.

Fuchsias should be stopped at the points, and young stock shifted into larger pots. The early plants may soon be supplied with weak liquid manure—that is, as soon as they fill their pots with roots; cuttings taken now will make useful plants for autumn flowering. Another sowing may be made of *Torenia*, the plants raised being grown in a warm pit. *Nicotiana affinis*, *Balsam*, *Rhodanthus*, *Celosia pyramidalis*, *Cockscomb*, *Primula sinensis*, and a pinch of *Cineraria* seed, if these last named plants be required at a very early date. *Musk*, *Mimulus*, and *Intermediate Stocks* should not suffer for want of moisture at the root.

Named varieties of *Cinerarias* from which cuttings

are desired, may be put into a cold frame not exposed to much sun, the cuttings being taken off when 2 inches high. Liliams, as the top growth increases, should be afforded a top-dressing of decayed manure and loam, and when potting the bulbs it is best to leave space for this. Bulbs late-potted, should have the plunging material removed before stem-growth is far advanced; this succession will require less water than the earlier one. Seeds of Campanulas for pot culture may be sown, and the pans kept at a temperature of 60°, removing the seedlings when visible to a frame. Seedlings of last year may be shifted into larger pots; these plants are of great use in large houses. *C. calycanthum* and *C. pyramidalis* are best for pot culture, and they are best when grown in loam in which a small quantity of decayed manure and old mortar are put, and made very firm. *Geo. Wythes, Syon House, Brentford.*

THE ORCHID HOUSES.

EAST INDIAN HOUSES.—The treatment of the spring flowering variety of *Angraecum sesquipedale* should be in all respects the same as that of the typical plant. It has been doubted if there are two distinct blooming seasons for this plant; to which I say yes, undoubtedly! The plants revel in heat and moisture; but air, and atmospheric moisture must also receive due attention. *Epidendrum Stamfordianum* is a pretty species, seldom seen. When the plant is a strong one, it makes a large spike of brightly coloured flowers, which have the odour of ripe Oranges; it does well in baskets, near to the roof. *E. dichromum* is another pretty Orchid that is rarely found in good condition, it being usually placed in a house that is too cool for it. The plant requires great heat, but thrips are partial to it, and a constant watch should be kept for them. A little tobacco smoke given twice a week checks the thrips, doing this when the foliage is quite dry, and the roots moderately dry. It is not at all necessary that the house should be filled to suffocation. If done as I have suggested in previous Calendars, it acts as a preventive; but where thrips abound, dipping and sponging in tobacco-water and soft-soap must be adopted, until the infested plants are thoroughly cleansed. The temperature may now be 70° at night, with a rise of 15° by sunlight, with air on.

Cool House.—*Oncotoglossum pulchellum majus* will now be going out of bloom, and if the plants were not re-potted in September last, that should be done now. Give *Disa grandiflora* and *D. racemosa* manure-water, as recommended for *Miltonia vexillaria*. Very little water will need to be applied to any plant in this house with the water-can, the syringe, if freely applied, doing nearly all that is necessary. Temperature, 50° at night, with a rise of 10° by day. *A. G. Catt, Parkfield, Worcester.*

FRUITS UNDER GLASS.

ORCHARD HOUSES.—Where a mixed collection of fruit trees in pots is grown there is the risk of a failure of the crop by neglect of root watering at the right time, and besides a collection of mixed kinds sometimes leads to various kinds of compromises at this season of the year which result in poor crops; nevertheless under good management very fine Apples, Pears, Plums, Cherries, Figs, Peaches, and Nectarines may be produced in Orchard-houses, the first three often excelling open air fruits, and especially is this true when the trees are grown on Donnic, Quince, or Mussel stocks, and well supplied throughout the growing season with manure water of some kind. Although Orchard-houses may be a necessity in cold and exposed districts, the handsome looking fruits produced in them are not equal in flavour to those grown in the open in favourable districts; Apples, Pears, Plums, and Cherries, must at all times of night and day (sharp frosts or keen windy weather excepted) have free ventilation, and the trees should be arranged together at the cool end of the house. A little warmth should be maintained in the pipes so as to create a buoyant atmosphere in the house.

Runaway shoots must be pinched to four or six leaves, and thin sprays removed. Watch for the first appearance of insects, and fumigate for aphid or yellow thrip. Syringe the trees occasionally with clear decanted soot water or soapy water, but not

during sunshine; unroll leaves curled round the caterpillar of the winter moth, and destroy the grub. It is not possible to say what number of fruits an individual tree or a bush should carry, but in all cases it is better rather to under than over-crop. Towards the middle of the month of May some of these trees or bushes may be placed in a sunny but sheltered position outside, the pots being plunged in fine coal ashes or Cocoa fibre refuse. If any roots show on the surface top dressings of turfy loam, bone meal, and horse droppings should be given from time to time as may seem to be required.

Tomatos.—Plants raised in August last from cuttings, and set early with fruit, will now be showing colour in the same, and part of the foliage may be removed to allow the inlet of light, leaving two lobes of the leaf unremoved. An irregular system of tying in the laterals is preferable to cordon training for winter-grown Tomatos, owing to the great difficulty of setting the fruit, which has to be done artificially with camel-hair brush, the unfruitful wood having to be pruned out occasionally. Spring-planted Tomatos, or those grown in large pots, are best cordon-trained. I find that Hackwood Park Tomatos, and good selections from the Old Red, set fruits more freely in winter than those of the Perfection type. The plants are best when grown in a free compost, but made very firm, and not enriched with animal manures. Abundant ventilation, but no draughts, is necessary—55° to 60° is the proper night temperature, and 70° to 80° by sun heat. Close stagnant air is fatal to the Tomato; if this be combined with strong manures, it will probably produce the much-dreaded Tomato disease. Therefore, do not close the house to keep up the temperature, excepting after the customary afternoon syringing; but rather keep the ventilators open, little or much according to the state of the weather, and make use of the hot-water apparatus. Prepare the plants required for walls or other contrivances outside, and pot them on as soon as ready in 6 or 7-inch pots, and if a little pot-bound by the middle or end of May, it will be so much the better.

A row of plants planted out in a Strawberry-house when forcing is over, will give abundance of first class fruit up to Christmas.

Strawberries.—If plants have been introduced into the houses as advised, a regular succession of fruit will now be realized, and whenever extra dishes are required, it will be found easy to retard some, or to push on others. The fruit will be of superior flavour if allowed to finish slowly on dry, sunny, airy shelves, and not gathered till highly coloured, and not watered with liquid manure, but given a reduced quantity of clear water.

When fruit is required for travelling, it must be gathered as soon as it is coloured. It will be found advantageous if a board 6 inches in depth be fixed to the front of the shelves, to prevent the sun striking the sides of the pots, and which will also economise watering. Feeder roots may now be observed in the turf squares or pulps of moss under the pots. Keep the syringe going daily amongst progressing crops, and endeavour to keep the foliage free from red spider up to the finish. Strawberry plants once allowed to become dry at the roots so as to flag, are certain to be attacked with spider. Continue to ventilate prudently, and so build up stout foliage; and harden off old plants required for planting out. I treat out-door plantations of mid-season kinds simply as annuals with good results, but for the supply of early runners for forcing purposes, I plant in August runners prepared early, and allow each plant on an average to carry three strong runners, which by July are ready for placing in the fruiting pots. The earliest and best out-door fruit can be gathered from the same source. *W. Crump, Madresfield Court.*

THE HARDY FRUIT GARDEN.

FIG TREES ON WALLS.—The protective materials should now be removed from the trees if this be not already done, and if the pinching and stopping of shoots were closely attended to during the season of 1889, there will be but little pruning now requiring to be done; but if some pruning should be required, the least matured shoots may be thinned out, and any shoots which show the smallest number of embryo Figs cut out clean. The shoots of Figs are better if trained in a horizontal direction, as they become then more fruitful, and the trees are better balanced than when fan or perpendicularly trained. The horizontal training here meant is really a modification of the fan

method. Eo.] Pay particular attention to the protection of bloom on wall-trees of all kinds. There is much damage done to fruit trees by retaining protection too long over them, and in having it of too heavy a nature. If aphides are found at this stage to be infesting the bloom, the shoots most affected may be dusted with tobacco powder or other insecticide, and curled leaves crushed between the finger and thumb. *A. Evans, Lythe Hill, Haslemere.*

THE KITCHEN GARDEN

CEREAL SEEDLINGS.—The earliest plants will be large enough to prick out, and for this succession a frame should be employed to cover them. In preparing the bed for their reception, which should be in a warm spot, place a layer, 6 inches deep, of short warm dung and tread it firmly, and over this put a layer 3 inches thick of light sandy soil, and beat the surface smooth and level with a spade. The plants should be thoroughly watered before pricking out is begun, which should be done at 3 inches apart, watering the soil well at the finish. The frame should be closed for a few days, slightly dewing the plants over twice daily and shading them when sunshine is strong until rooting has taken place, when more and more air must be afforded them. Make a final sowing of the red kinds, in which Major Clark's should be included. Sow in pans or boxes to secure young plants for soups and flavouring.

Broad Beans.—Another sowing should be made on well-tilled soil, if planted in double rows, 3 feet should be allowed between the rows, and 6 inches from plant to plant. Magellan and Longpods sown in February will now be several inches high, and may be hoed freely; and if slugs are troublesome, soot and lime should be dusted over the rows.

Spinach.—Spinach may be more frequently sown than hitherto, and to avoid breaks in the supply it will be advisable to sow small breadths at a time. The round-seeded variety should be sown at intervals of ten days, and the Viridley, which is of robust habit, and is longer in running to seed, less frequently. Sow in beds by itself, or, if needs must, between the rows of Peas, and thin out moderately when nicely up. If the soil be very dry at the time of sowing, water the drills before covering the seed with mould.

Cabbages should be earthed up as they may seem to require it, and whenever the soil becomes baked on the top, it should be broken up with a Canterbury or other hoe. Eiland's Early is a Cabbage that is now fit to cut; and although not of a large size, it is one of the best of the early varieties, and should be cut before heading, or it is liable to split, and then become almost useless.

General Hints. Keep the hoe in constant use on all plots of land, to destroy weeds, and give every attention to the stirring of the surface between growing crops. Potatoes and other vegetables in frames must be well ventilated in fine weather, and not allowed to suffer from dryness at the roots. Stir the soil between young Cauliflowers, Carrots, Brussel Sprouts, &c., and keep down weeds of all kinds. *H. Markham, Mereworth Castle, Maidstone.*

PLANT PORTRAITS.

ARTHURIA VEXILLIGERUM, Garden, March 22.—A pretty greenhouse species, now found to be hardy, or nearly so, although a native of Rio. The proper name for this plant is *A. megastachya*, but the name given by the late Professor Morren will probably survive in gardens.

APICOT (the Peach), Bulletin d'Arboriculture, March.

BILBERGIA PERRINGIANA X.—A hybrid between nutana and Liboniana; flowers in loose racemes, bracts and calyx rose-coloured, petals blue, *Gartenflora*, March 15.

CYMBIDIUM MASTERSII, Lindleya, t. 222.

CYPRIPEDIUM ELLIPTICUM, Orchid Album, t. 347.

DENDROBIUM BLYMERIANUM, Orchid Album, t. 378.

DISA GRAMMIFOLIA, Orchid Album, t. 399.

LELIA PUMILA, Orchidophile, February.

YORISEA MORESIANA X BARILETTANA, Illustration

Horticole, t. 91.—Leaves tufted, oblong, entire; flower-stalk erect, expanding above into a flat two-edged blade or spike, consisting of two rows of boat-shaped bracts, scarlet at the base, greenish-yellow at the tips. Highly ornamental.

EDITORIAL NOTICES.

Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor. Such communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, and sent as early in the week as possible.

Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are also solicited.

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

NEWSPAPERS. — Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, APRIL 15. } Royal Horticultural Society at
Chiswick: Fruit, Floral, and
Scientific Committees, and Def-
erred Conference opens (four
days).

THURSDAY, APRIL 17.—Linnean Society.

SHOWS.

TUESDAY, APRIL 15. } Daffodil Conference at Chiswick
(four days).

WEDNESDAY, APRIL 16.—Newcastle (two days).

THURSDAY, APRIL 17. } Royal Horticultural of Ireland at
Dublin.

SALES.

WEDNESDAY, APRIL 15. } Rose, Shrubs, Climbers, Border
Plants, &c., at Stevens' Rooms.

WEDNESDAY, APRIL 15. } Lilies, Palm Seeds, Plants, &c., at
Protheroe & Morris' Rooms.

THURSDAY, APRIL 17. } Collection of Orchids in Flower and
Bud, at Stevens' Rooms.

FRIDAY, APRIL 18. } Imported and Established Orchids,
at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—48° 2.

Fruit Culture. THE British Fruit Growers' Association has adopted the plan of commissioning competent lecturers to visit particular districts, and give instruction in fruit culture. This is a procedure which our French and Belgian friends have long ago adopted with very great advantage, and it is one which we have over and over again pressed upon the notice of the Royal Horticultural Society, but hitherto without avail, and, as a consequence, another Institution steps forward to take up work which the parent Society was pre-eminently well qualified to undertake, and which, as will be seen from a document that has reached us since these remarks were written, she now proposes to do if asked.

A very large measure of ignorance, and a still larger amount of indifference, prevail in country districts as to the culture of fruit trees, the sorts to be grown, the necessity of care in selecting for market, and the exercise of judgment as to the time when the fruits should be offered for sale with the best chance of a remunerative return.

We have repeatedly called attention to the

waste of energy in the case of local horticultural shows generally. A day's holiday, the transfer of a few shillings, or a pound or two, or it may be of a copper kettle from one possessor to another—these are pleasant and innocent things in their way. We would by no means disparage them; but we would once again ask the managers of these exhibitions, whether the benefit to horticulture is in any way commensurate with the zeal, the labour, and the cost expended upon these gatherings? There is no reason why something of more substantial advantage should not be associated with the friendly rivalries and eager competition of the exhibition tent. The conferences held by the Royal Horticultural Society of late years supply useful models for imitation. Another plan would be to invite some competent practitioner to explain, and, as far as possible, to demonstrate methods of cultivation, to show by actual example how grafting, pruning, or even planting should be done. Exhibitions might be made of the kinds of fruit or vegetable best adapted for general cultivation, or for special use in the particular district in which the show is held. The prizes might consist of selections of the best seeds, or fruit trees, or of orders to dealers which could be executed at the proper season. Something of this kind, we believe, has been adopted with success at Grantham for many years past, and it is easy to see how the plan might be extended and modified so that the local horticultural society might do something more than provide an excuse for an outing, and show that horticulture has higher aims than that of affording an opportunity for beating one's neighbour and triumphing over his discomfiture.

The Fruit Growers' Association has set a good example by commissioning Mr. WRIGHT to address the members of the Ellesmere Horticultural Society on the subject of fruit growing. His address, as we see from the extended report in the *Salopian and Montgomeryshire Post*, was judicious and practical, neither fostering vain hope and exaggerated anticipations, nor undervaluing the real benefits that may accrue from the judicious extension and improvement of fruit culture.

“Mr. WRIGHT commenced his lecture by referring to the differing views that were entertained on the subject of fruit growing—the optimists, he said, regarding it as only another name for fortunemaking, while the pessimists described it as all fudge, fro^o which nothing could be gained. He thought the truth on this and other matters was to be found somewhere between extremities of assertion. He dealt somewhat trenchantly with persons who proclaimed their incapacity as cultivators by preaching in newspapers the doctrine of fabulous profits for all who would plant certain trees, and reminded his hearers that it was very necessary to beware of quacks. He directed attention to the action of the Royal Horticultural Society, the Fruiterers' Company, and the British Fruit Growers' Association in procuring and disseminating information, with the object of increasing and improving the fruit supplies of the kingdom, as altogether more reliable than the preaching of popularity-hunting crusaders. He pointed out the unwisdom of trusting to any one kind of fruit alone, such as Apples or Pears, for producing profitable crops yearly, and adduced instances showing that losses had been incurred by such ventures, especially when a tree each of a great number of varieties had been planted. He strongly advocated a directly opposite course—of planting many trees of a few of the best varieties, not omitting a due proportion of the more certain-bearing small or bush fruits; and said that under the combination system he had never known a total failure; but, on the contrary, with a good choice of sorts, good soil, and good management, a

fair return would accrue to cultivators, and much better than they could obtain from farm crops. He would not, however, advise inexperienced persons to invest all their money in fruit growing, and thought farmers should only regard it as an adjunct to other crops. He should like to see good collections of fruit well grown around the stately homes of England, both for supplying those homes with the rarest and choicest samples, as well as for educational purposes, in showing the tenantry the varieties that would be the most remunerative to them.

“Several examples of land being increased in value by fruit culture were given, and of the consequent higher rents obtained on the termination of tenancies. An extension of the best Kentish methods was advocated, and a distribution of production over a much wider area, as trees were often barren in one district and laden with fruit in another, it might be 200 or 300 miles north of London, through the later blossoming of the trees. The fallacy of the reiterated allegation of fruit to the value of £8,000,000 being imported annually that might be grown in this country was exposed, and it was because the statement had scarcely an approach to truth that there was such a wide field open for British cultivators, who were advised to adopt American methods in selection, culture, packing, and marketing, then the time would not be long in coming when our enterprising rivals would be beaten in our markets. After indicating the periods after planting at which different kinds of fruits become profitable, Mr. WRIGHT gave practical hints on situations and shelter for trees, soil and its preparation, planting, pruning, and manuring some of the more important manipulative points, including the arrangement of trees, being illustrated by large coloured drawings.”

THE ROYAL HORTICULTURAL SOCIETY.—

Much as has been already accomplished by the zeal and energy of the council, some items in the programme recommended for adoption by the outside Committee, have perforce had to be postponed. So zealous has the council been, so energetic its officers, that to complain of delay would be ungrateful. Moreover, the Council has shown itself so desirous to carry out the wishes of the Fellows, and to consider fully all proposals made to it, that there are excellent grounds for the belief that they will continue in that course, which, to the astonishment of some, has rescued the Society from the slough into which it had fallen. Among other proposals, is one for a more adequate affiliation of local Societies with the parent body, and this we trust will be followed by the establishment of local secretaries and district councillors or representatives in every county. The following suggestions have been handed to us for publication:—

“Local societies subscribing £1 ls. will be entitled to (1) two copies of the Royal Horticultural Society's *Journal* for circulation amongst the local Society's members. (2) To nominate one of their members to rank as a £1 ls. Fellow of the R.H.S. with a £1 ls. Fellow's privileges, with the exception of the Society's *Journal*. (3) One transferable ticket, admitting to all the R.H.S. meetings and shows, and which may be used by any members of the local Society. (4) To purchase at cost price one Silver and one Bronze Medal of the R.H.S. (a new medal is being struck, and until that is done the price cannot be fixed). Local societies subscribing £2 2s. will be entitled to: (1) four copies of the R.H.S. *Journal* for circulation. (2) To nominate two of their members to rank as £1 ls. Fellows of the R.H.S., &c. (3) Transferable tickets admitting to all the R.H.S. meetings and shows, &c. (4) To purchase at cost price two Silver and two Bronze Medals of the R.H.S. Local societies are invited to send interesting exhibits and specimens of plants, diseases, &c., to the R.H.S. fortnightly meetings of the Floral, Fruit, Orchid, and Scientific Committees, and to correspond with the R.H.S. Secretary, or any interesting subjects or events in their locality. The secretary of the R.H.S. will at any time be happy to assist the Secretary of any affiliated

FIG. 69.—MR. BIRDA'S GARDEN AT ST. JEROME'S, BATA, (1871, 1872)

W. H. BIRDA'S GARDEN

GARDEN

Society in introducing them to horticulturists or specialists able and willing to deliver lectures on interesting subjects before meetings of their local Societies. W. WILKS, Sec., R.H.S. By order of Council."

HALL OF HORTICULTURE.—Boston has its magnificent hall at the disposal of the Massachusetts Horticultural Society, where its unrivalled horticultural library is housed; Paris is almost equally well endowed. London has to hire a drill shed and two rooms in Victoria Street; and yet no Society of the kind in the world has done so much for horticulture, and none is capable of rendering such efficient service as the Royal Horticultural Society. An attempt is now being made to secure a suitable permanent home for the Society, under conditions which involve the Society under scarcely larger pecuniary responsibilities than at present, and about £10,000 have already been promised. The plan, as already mentioned, presupposes the collection of some £30,000 or £40,000 to be lodged in the hands of trustees, and devoted to the erection of a suitable building. As the horticultural trade are so largely concerned in the matter, their co-operation is invited; and, as will be seen, a meeting is to be held at 117, Victoria Street, on April 22, at 1.30, to discuss the project. We subjoin the circular:—

"Royal Horticultural Society,
"117, Victoria Street, Westminster.

"You have doubtless heard of the proposal to build a great Central Hall of Horticulture in some prominent position in London, similar to the magnificent buildings which the Société d'Horticulture de France possesses in Paris. The effect of those central buildings on the whole horticultural trade of France has, I am told, been very marked, not only in the neighbourhood of Paris but throughout the whole country, and we anticipate that a no less marked benefit would accrue to the whole horticultural interest of Great Britain if we possessed a similar central institution. It would promote, encourage, and stimulate an increased love and knowledge of gardening from one end of our country to the other, and produce everywhere an increased demand for all horticultural subjects, thus greatly enhancing the transactions and emoluments of the trade.

"The promotion of such a scheme is, however, a matter demanding a far greater outlay of money in London than was required by our neighbours in Paris, the comparative value of land in the two capitals being almost beyond calculation. All the more necessary is it, therefore, that all horticulturists, both professional and amateur, should join cordially together in promoting the scheme.

"For these two reasons, (1) the impetus which it would give to gardening everywhere, and (2) the absolute necessity of friendly co-operation, the trustees of the new buildings—Sir TREVOR LAWRENCE, Bart., M.P., Baron HENRY SHERWOOD, and E. A. HAMRO, Esq., have desired me to call a meeting of the whole horticultural trade of the kingdom, to be held at the above address on Tuesday, April 22, at 1.30 p.m., punctually, to consider in what way the trade can best help on the movement.

"Hoping that you, or some representative of your firm, will be able to be present on this occasion,

"I am, &c.,

"W. WILKS, Secretary."

ROYAL BOTANIC SOCIETY.—A series of lectures, commencing on Friday, May 9, and continued on the five following Fridays, will be delivered at the Gardens of the Royal Botanical Society of London, Regent's Park. The first and fourth lectures will be delivered by Mr. E. M. HOLMES on British Sea Weeds and British Mosses. The second and third by Mr. G. R. M. MURRAY on Insectivorous Plants and Flowering Parasites. The last two lectures, on Vegetable Oils and Fats and on India-rubber and Gutta-percha, will be delivered by Mr. J. R. JACKSON. The lectures will be delivered in the Museum in the gardens at

4 o'clock in the afternoon, and they will be free to fellows and members of the Society as well as all visitors in the gardens at the time.

"JOURNAL OF THE ROYAL HORTICULTURAL SOCIETY."—The first part of the twelfth volume has been issued, containing the reports of the Vegetable Conference and of the Chrysanthemum Conference—both remarkable gatherings. The first was of special utility, the second is of particular value from the point of view of history and progress. Events succeed each other so quickly, that the reports of shows held in September and November have lost much of their interest by March—at least, for those who took part in them.

THE DAFFODIL EXHIBITION AND CONFERENCE.—We may remind our readers that this interesting exhibition will be opened at the Royal Horticultural Society's Garden at Chiswick on Tuesday next, April 15, at 3 p.m., by H.R.H. the Duchess of Teck. On Wednesday, Professor Foster will open the Conference at 2 p.m. with an address. Mr. Scrase Dickens, Mr. Burbridge, Mr. Engleheart, and perhaps Mr. Dorrien Smith, will address the meeting. On Thursday, Mr. Baker will preside at the same hour; and Mr. Wolley Dod, Mr. J. T. B. Pocock, Mr. Engleheart, and Mr. Walker, will narrate their experiences. Chiswick is easily reached by rail to Turnham Green, Acton Green, or Gunnersbury stations, all within a few minutes' walk of the garden.

THE WILDSMITH MEMORIAL FUND.—We learn that the promoters of this memorial are very desirous of publishing a concluding list of subscriptions, and bringing the collection to a close. About £20 more are needed to complete the memorial, when the amount gathered will be at once handed over to the committee of the Gardeners' Orphan Fund. It would be a pity if the funds fall short of the occasion by so small a sum.

CONSETT PARK.—Mr. DUNCAN SMITH, landscape gardener and rockwork artist, has been engaged by the Consett Iron Company to lay out their new park at Consett and Black, Durham.

BRITISH FRUIT GROWERS' ASSOCIATION.—The following arrangements have been made for the year 1890:—Conferences: June 27, Royal Aquarium, Westminster—Strawberries and Bush Fruits. August 5, Leicester—Fruit Culture for Profit. September 5, Crystal Palace, Sydenham—Plums and Stone Fruits. September 11, Brighton—General Fruit Culture, including Grapes and Tomatoes. October 15, Royal Aquarium, Westminster—Apples. Hon. Secretary, LEWIS CASTLE, Hotham House, Merton, Surrey.

MEXICAN FLORA.—M. MAXON has been requested by the Mexican Government to accompany the surveying expedition charged with the preparation of a map of the country in the capacity of botanist. M. MAXON will collect specimens for the Paris and other herbaria.

"EPHARMOSIS."—Under this title a distinguished French botanist, M. VESZAR, has published a series of valuable papers on what in this country are called adaptive characters, that is to say, characters or points of structure, dependent upon the conditions of soil, temperature, light, &c., under which plants grow. This relation of structure to "environment" is for M. VESZAR "Epharmosis." The species of Capparidæ were studied in their anatomical relations, and now we have before us a similar treatise on the Guttiferae. The anatomical characteristics of the plants constituting the order are detailed, a distinction being drawn between those which are congenital, and those which are acquired, no fewer than 162 anatomical plates being given. The necessity of studying the minute anatomical characteristics of a genus is becoming as apparent as the investigation of the ex-

ternal morphology has long been. It is unfortunate, however, that its study must tend more and more to foster specialism. The time required in these researches is so long that the student will be compelled to confine himself to one or two groups only. This being the case, it is of the utmost importance that students should obtain a sound general knowledge of botany before they launch into specialism. This general knowledge it is which is neglected in the botanical teaching of the day. The study of the adaptive characters is likely to prove of the greatest value to cultivators, as indicating to them the conditions under which the plant has grown, and those, therefore, under which, with the necessary modifications, it may be expected to grow in gardens. We earnestly hope that some one will treat *Occhil* structure on the same lines as M. VESZAR has done the Guttiferae.

VARIATION THE CONSEQUENCE OF FROST.—MR. ETTINGHAUSEN and KRAZAN have observed, that after a severe frost, which did much injury to certain Oaks and Beeches, leaves were put forth in the following spring—unlike the ordinary leaves, but recalling those of some of the American species, and even some species now only known in a fossil state. The authors are of opinion that the species now only known in a fossil state did not disappear suddenly by the extinction of individuals, but by successive change of characters, according to circumstances, so that they acquired ultimately an appearance quite different from that which they had at first. Similar changes in the leaves of the same tree have been observed as a result of the attacks of insects. Hence existing species are the result of transformations effected in the parent stock. In connection with this circumstance, we may recall a similar illustration in the case of the Japanese Maple at Mr. JONAS WATERBURY'S nursery, one side of which was injured by salt winds, and which has ever since produced leaves and flowers of a different character to those on the opposite side of the tree.

BEEES IN GERMANY.—We read in the *Alsee and Lorraine Bee Journal* that, according to an estimate presented to the German Reichstag, the culture of bees brings in yearly a total net profit of 17,000,000 marks to those engaged in the occupation. This is a much larger sum than anyone had imagined, and which may be still further augmented.

ROSES.

AMONG THE ROSES.

"I SUPPOSE you are come to see the ruins," was the salutation which greeted me from Mr. George Mount, as I entered his Rose nursery at St. Dunstons, Canterbury, on March 17. I at first hardly solved what he meant, but then the remembrance of the bitter frost that we experienced on the morning of the 14th ult., occurred to my mind. "Were you hard hit, then?" was my question. "Come and see" (not quite in the sense of some perennial advertisements). I did go and see, as mournful a sight as it has ever been my lot to witness.

Canterbury lies in a basin, through which the River Stour slowly wends its way, and consequently is liable to damp touches of frost; but although I have known it for many a long year, I have never known it to undergo such a bitter experience as on this occasion, when the thermometer went down, at a foot from the ground, 5° below zero, and it may well be imagined what havoc it wrought. Fortunately there had been a good fall of snow previous, or the results would have been more disastrous still; but just let me say how my friend Mr. Mount suffered from it. He has gone in very largely for growing Roses for cut blooms, as well as for plants. For these cut blooms

he has several large houses for early work, while for the later work of June and July, he has several wooden fences throughout his gardens, as well as a large number of dwarf standards, and it is amongst these that the sweep has taken place; he had grand plants of *Maréchal Niel*, *Rève d'Or*, *William Allen Richardson*, and others, so useful for bouquets. These are all, if not killed, so utterly crippled, that it will be probably better to cut them all away; at any rate, as far as this year is concerned, they are worthless. And yet, looking at the wood, I should in many cases have said this is all right, it looks plump, and shows no sign of withering. I said so. "And so," said Mr. Mount, "I thought, until this morning, but knowing you were coming, I determined to go round previously, and I have condemned them. Look at this piece, it seems plump, we will cut it," He did, and the discoloured bark told its tale: it would not die off, perhaps, but the shoots would be so weak as to be utterly useless. Now all the havoc occurred in about two hours between 6 and 8 A.M. on the morning of the 4th. The night had been cold, and it was freezing sharply, but this cold "snap" did not come until the morning. All the Rose trees in the garden, hybrids and Teas alike, had been killed to the snow-line, but these will, of course, shoot up again; some standards that had been worked in the autumn, and were not so full of sap, escaped, and so did the dormant buds.

I have thought it worth while to record these facts, because amateurs will be, or ought to be, amongst the Roses at this time, and the all-important question of pruning will be occupying the thoughts and employing their hands; and after seeing these plants, I should say that if anything like this frost has occurred generally, the pruning must be hard this year. It will soon be time to get amongst the hybrids, and they should be cut hard, unless in some exceptional cases, where the strong growth of some kinds must be taken into consideration, or else if pruned hard they will go to wood; but even this admits of limitation. When writing of strong growers, most people cite as an example *Etienne Levet*, but with me it never grows very strong, as mine is not a Rose soil. I thought nothing of this, but I was surprised to have so experienced a grower as Mr. Ben. Cant say the other day, that it never grew strong with him, and yet he has good Rose soil, and knows how to treat Roses.

Those amateurs who grow for exhibition, will probably not only not disturb the mulching on their beds at this season, but will add to it, so as to give fresh vigour to the young shoots, and lead them to produce fat blooms. Those who do not, will now clear off from their beds all the long littery stuff of the autumn mulching, and gently fork in the short stuff, or else take all away, long and short. I have always allowed the thin straggling wood of the previous year to be cut out in the autumn, leaving only the three or four long shoots which have come up from the base of the plant. This will greatly facilitate the process of pruning now. Those who have small gardens must remember that this continual heaping on of manure has its drawbacks; the land becomes so full of it that the bushes cannot assimilate. Turtle and milk punch may do very well now and then, but they would not quite form an everyday diet to live upon; and I have known many an ardent amateur who supposed that he had nothing to do but to manure highly and go in and win, after a season or two fall lamentably into the background, the Roses refusing to grow. There are only two ways in which this can be remedied, the first, not always practicable, a complete change of garden; the other, within the reach of most people, taking out a portion of the soil every year and putting in instead an equal quantity of good loam, thus gradually renewing the beds.

Although in the system of pruning adopted by exhibitors, the form of the bush has but little importance, there are certain matters to be observed. Care should be taken to cut to a bud which points outwards, so that the centre of the bush should not be crowded. Although the French use

the "sécateur" most for this operation, I believe that with us the knife is the favourite weapon; the former is apt sometimes to bruise the shoots, and with a stout arm and a pair of gloves, there can be nothing better than a good pruning knife. Experience can alone teach the grower as to how perpetual Roses may be pruned, but generally speaking, the more delicate-growing varieties require to be pruned the hardest, and should be cut down to about three eyes; the more robust will not need such hard pruning, and in the same way if a plant of a Rose, which, in ordinary circumstances, is a fair grower, exhibits weakness, it will be best to cut it in very hard. When the beds are done, the cuttings should be raked off, and the beds made generally tidy.

It is impossible just now to forecast the season, but all one can say is, that where that terribly severe snap of frost was not experienced, Roses look well, and are not nearly so forward as some people imagined they must be.

I need hardly say that it is too early to prune Tea Roses, they should be left for another month. *Will Rose.*

PHALANOPSIS IN THE PHILIPPINE ISLANDS.

It is undoubtedly of great importance to our botanists to have as much information as possible when describing a new species; its surroundings, its nearest allied neighbours are almost as necessary as the simple description of the plant itself. As far as my own experience will allow me, I will endeavour to give here the exact distribution of the section *Euphalanopsis* which grows in the Philippine Islands. The long chain of extinguished volcanoes, running from south to north, connecting the Moluccas with the Island of Formosa and Japan, seem to have had their part in the distribution of *Phalanopsis*, as almost all the known species lie in this line, and away from which they do not appear so numerously. Moreover, we may connect each well defined species with its own extinguished volcano, and around which it grows more numerous than elsewhere. Singularly enough the few active volcanoes, although well-wooded to a great height, are almost destitute of *Phalanopsis*. Beginning at the southernmost point of the Archipelago lies the small island of Balut, at 6° N. lat., with its extinguished volcano Sarangani. Here the typical form of *P. Sanderiana* grows—leaves green, and flowers dark rose-coloured and no other form is to be found on the island. Their area of distribution may be said to lie between the sea-level up to an elevation of 800 feet, which corresponds exactly with the limits of Bamboos in these latitudes—the beginning of the Fern region. Crossing the channel to the Island of Mindanao, the second in extent of the Philippines, along the coast from the south point, Sarangani to the west, as far as the volcano of Pollok, a white-flowered *Phalanopsis* grows, with silver-grey markings on the leaves, similar to those of *P. Schilleriana*, but not yet described as a distinct species, although often sent home amongst plants of *P. Sanderiana*. It is most likely that from here came the variety described as *P. Schilleriana alba*. Turning east to the Bahía de Davao, from Sarangani to the River Hijo, from the very sea-shore up to the slopes of the volcano Apo, came all the *Phalanopsis* sent home as *P. Sanderiana*. It is on this particular spot that so many varieties have been found having variation in the colour of their flowers and the markings of the leaves—the result, undoubtedly, of inter-crossing between three different species, viz., *P. amabilis*, *P. Sanderiana*, and the white-flowered silver-grey-leaved species.

In no other part of the Islands are so many species formed in such near proximity as there. Although *P. amabilis* and *P. Schilleriana* are to be found growing in close proximity to each other in the island of Luzon, yet they do not seem to intercross with such facility as the above-mentioned species undoubtedly do. On the north coast of Mindanao,

from the south-west point of Zamboanga up to the River Agusan, but not crossing that river, *P. amabilis* grows in great abundance, and amongst them in the Bahía de Iligan a singular variety of *P. amabilis*, with flowers more richly marked with yellow, and the plants are generally found growing in clumps together. The same island is also the home of *P. Stuartiana*, and we may give the valleys around the lagoon of Meinit as their favourite haunt. This lagoon lies at the north-east point of Mindanao at an elevation of a few hundred feet above sea-level, having its source in the very centre of a crater. *P. Stuartiana* is also to be found in great profusion in the very humid valley of the River Agusan, far into the interior of Mindanao until reaching the rivers flowing south, where some strayed *P. Sanderiana* may be found; hence natural mules between them have already appeared. So far Mindanao, which in extent is the second of the Archipelago, is the richest in species, but a great part of the island is not searched yet, and there can be no doubt that some new species may yet appear.

P. amabilis grows all over the Philippine Islands, indeed very few are entirely destitute of them, yet its cradle may be traced to the central part of Luzon, which is the greatest of the 100 Islands, and lies 300 miles north of Mindanao. The central part of Luzon, on the Pacific coast, and few adjacent islands, are the only places where *P. Schilleriana* is to be found growing, and where it occupies amongst its congeners the smallest area, and distant from the home of *P. Sanderiana* about 350 miles. The latter is considered to be a natural cross between *P. amabilis* and *P. Schilleriana*, which it may be botanically; but it seems to be too far off from at least one of its supposed parents for this to be likely. The several groups of volcanic islands connecting the Philippine Islands with Borneo, although included in the Archipelago, yet judged by their flora and fauna more belong to Borneo; but here is found the link connecting the *Phalanopsis* of Borneo with those of Java. In the Tawi-Tawi group a form of *P. amabilis* grows and in the Island of Palawan, *P. grandiflora* is found. From these islands a straight line down to Java may be traced, around which the different forms of *P. grandiflora* are growing. *C. Reichen, Singapore.*

VEGETABLES.

STANDARD BEARER CELERY.

I was glad to see this recently-introduced variety of tall Celery shown in fine condition at the late Vegetable Conference. The habit is sturdy, growth large, the stalks solid and of fine flavour. It will prove to be one of the best Celeries yet sent out. It is valuable because it will remain in good condition until late in the season; and at the present date (April 4), we have some of it that is very good. Standard Bearer was shown in good condition at the meeting of the Royal Horticultural Society, March 25, and the Fruit Committee considered it to be a valuable late-keeping variety. Those who may require Celery late in the season should certainly give it a trial. It is equally good for early use, as the Committee, at the Chiswick Conference, awarded it a certificate of merit. Much of its red or pink colour disappears by keeping it through the winter, and it is blanched very easily. It is dwarfier than most of the large red Celeries, an advantage of some moment, as less cutting-up is required; seed may be sown now, and again at the end of the month. I would also advise sowing the seeds very thinly for the last sowing, and in a cold frame, and planting out the seedlings in the trenches without first pricking them off. Thus treated there is no crowding in the seed-bed, growth is sturdy, and progress is rapid. I have had no experience with this variety on heavy soils, and an writing in its favour from having grown it on a light soil; but I have no reason to doubt its excellence in any other, as it has proved itself the best Celery for general purposes we have yet grown, and remarkable for hardiness. *G. Wythes, Syon House.*

FRUIT REGISTER.

STRAWBERRY EDWARD LEFORT.

A VARIETY figured in the *Revue Horticole* for February 6, and having globose fruit, with a long thick stalk or neck; the colour is rich crimson, the pips deeply imbedded. The highest character is given to the variety as a cropper, for flavour, and as a market fruit bearing carriage well. It seems to have carried off special prizes wherever shown. It is a seedling from a variety called General Chanzy. Our contemporary does not say where this highly praised novelty is to be obtained.

PEAR LEGER.

A novelty with fruit of middling size, irregular form, and when ripe it is still green. Flesh yellowish-white, watery, without sweetness or aroma.

The tree is enormously fruitful.

QUELIER BUENÉ.

A new variety, which possesses every property of a good Pear for extended cultivation, or small gardens.

The fruit is of medium size, light green with a light tinge of red on the sunny side whilst on the tree, and when ripe it is yellow.

The flesh is firm when ripe, of very pleasant flavour, and with fine aroma. Trees grow well on the wilding stock, and bear well. Ripe, October and November.

PEAR MANSUETTE DE BOUGNIES.

An old but still unknown variety, with numerous synonyms and certainly of Belgian origin. Handsome, regular form, flesh juicy, aromatic, somewhat acid and half melting. The rind almost wholly of a fine red colour. Rip in September. The tree is a strong grower, and well suited for general cultivation. *Bulletin d'Arboriculture.*

STICKING PEAS.

If a race of Peas could be produced which required no stakes to keep them erect, what a boon it would be to gardening. Here we have one of our most popular as well as useful of garden vegetables, presenting more trouble in its culture than almost any other. It is not that labour in staking Peas is grudged, that is a comparatively small matter, although with many, one of some concern. The difficulty lies rather in the getting Pea sticks at a fair price; with many, indeed, it is getting them at all. The gardener whose lines are cast in woodland districts, has, so far as Pea sticks are concerned, comparatively no trouble about them as compared with his urban or suburban brother, whose sticks, if he can get any to buy, cost nearly as much as the crop of Peas is worth when gathered; because for Peas we must have sun rays, its power of endurance is limited, and rarely are sticks of much service the second year. Thus it happens that if we will have our peas staked where sticks are dear and scarce, we must pay for the luxury. No wonder that myriads of town dwellers who have fair sized gardens prefer to buy their Green Peas to growing them, and that is bad for both the seedsman and the consumer, because if he grows good sorts he could have even from his own garden Green Peas on his own table, of the highest quality, whereas buying in the market he must take what he can get. In some cases birds present considerable difficulties to the cultivation of Peas. But, on the whole, they are more troublesome in woodland districts than elsewhere; and, all the same, Peas are widely grown there. It is possible to ward off the attacks of birds, because their damage is chiefly confined to eating the tops just as they come through the ground, or until strong growth has followed. Threads of wool or worsted, strained along the rows, will do much to keep away the depredators; but wire Pea-guards, enduring for many years, are on the whole best and cheapest. The use of a gun, when the Peas are in pod, although charged

with powder only, will have good results in keeping the birds away. But it is easier to ward off depredators than to provide the Peas with the needful support, and the problem to be solved is, what constitutes the cheapest and best substitutes for sticks. Perhaps the best on the whole would be found in stout squares or sections of flat wire trellis, made in heights of 4, 5, and 6 feet, and in 6 feet lengths. The mesh should be rather diamond-shaped than square, as the wires running obliquely would enable the Pea bud to secure a better grip of the trellis, than if the pattern be square. The mesh should be about 6 inches in height and 5 inches across, so as to afford full liberty to the hands in gathering; wire sections of this kind could be fixed more rapidly than ordinary Pea sticks can be, apart from the earlier labour in

intervals of some 9 inches apart from stake to stake along the rows, it will be of no service probably after one season's exposure. We might use soft iron wire for the purpose, having small holes in the stakes, or staples driven into them at intervals to pass it through; both stakes and wire would endure probably some three or four years if carefully stored during the intervening winters. Stout dwarf Peas, having rigid erect stems, are not at all difficult to sustain erect when cropping, but those who provide support of any kind, seem to think it will only pay when applied to tall growers, and when Peas reach 6 feet in height, they are in wet and windy weather very difficult to keep upright, especially when laden with pods. No doubt, for that purpose, nothing, not even good hazel sticks, will or would be so advantageous as the stout wire sections, 6 feet square, advised for tall Peas. In some parts of the kingdom where it is the detestable fashion to trim up the Elm tree stems to a mere mop-head, excellent branches for making Pea sticks may be obtained, about every six years. That is, of course, but an intermittent supply, and does not replace the considerable clearance of Hazel-wood which seems to be going on. Even where Hazel is plentiful and Pea sticks may be purchased cheaply they constitute such cumbrous material that cost of transit, proportioned to the actual value of the sticks, is abnormally great. It is about time that raisers of new Peas put on one side all varieties which exceed 4 feet in height, and give us ordinary kinds of exceptional stoutness. Also that wire makers favoured gardeners of Peas with cheap, satisfactory, and enduring supports. *A. D.*

FIG. 70.—TOOPE'S PLANT STAND.

pointing them, as it would be needful to drive in stout stakes at 6 feet intervals, and tie the sections of wire to them with stout string. When not required, fifty or 100 such sections could be stowed away in a shed or loft, occupying little space, and giving little trouble. With ordinary care, such wire supports should endure for twenty years, at least, during which time they would save their first cost, as compared with the cost of sticks, twice over. A temporary and cheap method of supporting Peas would be found in large mesh nets of varying heights and lengths, tied to stakes as for the wire sections. Still it is doubtful whether if ever so well cared-for the netting would endure for more than two years, and would make a flabby sort of support at the best. For dwarf Peas we might manufacture cheaply rough forms of trellis from thin wood for frames, and plasterers' laths for the intersecting mesh. If string be employed to sustain the Peas, being run at

USEFUL INVENTIONS.

The accompanying illustration (fig. 70) represents a new introduction of Messrs. Toope & Co., Stepney High Street, London. The article is sufficiently explained by a reference to the figure, which shows a snail turning away with disappointment when he finds there is water to be crossed. The top part of the pot is made of perforated zinc, and fastened in a watertight metal dish. The pot, or plant, is placed in the top part, as shown, and the dish is filled with water, so that slugs, &c., would have to swim to get a footing, to enable them to reach the plant. The dish also acts as an evaporating-pan.

CULTURAL MEMORANDA.

FUNKIA GRANDIFLORA.

The bold, sub-cordate leaves and spikes of pure white fragrant flowers, thrown well above the rich green, Eucharis-like foliage, entitles this Japanese Liliaceous plant to be extensively grown in borders and pots. It is a good plant for standing in vases in rooms, entrance halls, and for decorative purposes generally. The plant will reward generous treatment, and plants potted up now in sandy loam and leaf-mould, or as soon as they have made a little growth, in $\frac{1}{2}$ -inch and 6-inch pots, and stood on a bed of coal-ashes, in a low pit or frame, and kept close for a few days, make nice flowering plants by the autumn. The Funkia, of which there are several varieties, loses its leaves in winter, during which period the pots may be stood in a cool-house, or pit, or plunged to the rims in coal-ashes, out-of-doors, where water is not likely to lodge. *H. W. Wiant.*

LEMON-SCENTED VERBENA.

Cuttings a couple of inches long, taken off the tops of young shoots of this shrub, and inserted round the side of small well-drained flower-pots, filled with sandy soil, watered, and placed anywhere in heat, will soon take root, when they may be potted off singly in the same size pots, and being afterwards attached to in the way of giving water at the roots, pinching the shoots, and syringing over-

head, nice bushy little plants may be obtained by the autumn for furnishing purposes, and for cutting from. *H. W. W.*

THE BULB GARDEN.

NARCISSUS SIR WATKIN.

In a recent issue Mr. Wolley Dod gave an interesting account of this handsome form, and in the course of which he says that only one bulb had been known to vary from among the original stock, and this was regarded as a sport. My own experience does not quite agree with this, for frequently I find many flowers with the perianth segments of quite a pale sulphur colour, while the majority have segments of the dull tint of yellow seen in many of the Trumpet Daffodils. I send three blooms of each shade of colour, showing that it is not merely a chance flower, and it will be observed that the colour penetrates right through the segments, and is quite distinct, whether viewed in front or at the back. Neither is this variation of colour a matter of age in the flowers, for I put three blooms of each kind in water on March 25, and these retained their colour as when cut. The difference appears to be that the light-coloured flowers have their segments nearly, or quite, identical with *N. incomparabilis Stella*, while the dark ones have segments identical with those of *Golden Spur* in colour; I have, however, never seen the slightest variation in the colour of the cup, which appears to mark the one Mr. Dod refers to. *J.* [The blooms were coloured in the manner our correspondent describes. *Ed.*]

In speaking of this fine and stately incomparable *Narcissus*, Mr. Brockbank, at p. 396, tries once again to match it with the engraving on plate 41, fig. 1, of Hale's, or Hill's, *Elen* (1757, &c.) Personally I do not think that that figure was ever made from the variety we call Sir Watkin to-day. This, however, matters but little; still I am anxious that Mr. Brockbank should not, in error, suppose that Hale's, or Hill's, figure is in any sense a faithful and original one. The fact is, the figure alluded to in Hill's *Elen* is a reversed copy of a figure in *Hortus Floridus*, published by Crispian Passe, junr., at Utrecht, in 1811-17. At plate 4 it is therein named "*Narcissus onium maximus*," or "*Narcissus Nonpareille*." I believe I am right in saying that *Elen*, or a *Combat Bulb of Gardening*, was one of the works of the late Sir John Hill, a noted literary pirate and charlatan of his day. That he pirated many of Passe's original engravings is past all doubt, and he was accused of plagiarising Miller's *Gardeners' Dictionary*, and of many other little bits of smart piracy. He quarrelled with David Garrick, and the Royal Society of his day, which had refused to elect him, and seems to have been generally unreliable. *F. W. Buchholz.*

HOME CORRESPONDENCE.

THE GARDENERS' ORPHAN FUND.—The comparatively assured success of the Wildsmith Memorial Fund, a matter for warm congratulation, removes from the list of expectant recipients of the ordinary fund one orphan at least, and leaves the field open more fully to those who shall be nominated for election next July. Of these there is one child whose election is being promoted by that eminent and esteemed gardener, Mr. Rust, of Fridge Castle Gardens, which seems to have for various reasons a strong claim upon the sympathy of subscribers. Of course the claims of the child in question, an absolute orphan, having neither parent alive, will be fully set forth with those of other candidates at the next election, by the committee; but there is one special reason for sympathy in this case—one which, because somewhat sentimental, cannot be properly adverted to on the nomination paper. It is that the orphan in question is the child of an Irish gardener, and Mr. Rust makes natural as well as earnest appeal that the case should receive support on the special ground that it is the first application for the benefit

of the Fund from Ireland, and that the subscribers would show impartiality as to nationality as well as kindly sympathy in supporting the claim by their votes. Of course every candidate has a circle of friends anxious to secure the election of their favoured orphan. Still cases differ appreciably, and this particular one is sad enough. Apart from that, I would earnestly join with Mr. Rust in urging subscribers to show that they are above all prejudice, and are willing to manifest by their votes their breadth of sympathy, which is not limited to England, but extends to all parts of the United Kingdom. I have been looking over the published list of subscribers and givers of donations for the preceding year, and find a total of 1750. Out of these it is worthy of note that but 41 are from Scotland, 40 from Ireland, and 32 from Wales—in all 113; an infinitesimal number compared with the total, and an unsatisfactory proportion. The question is, does not this comparative paucity of subscribers from the sister kingdoms arise from lack of confidence in the management of the Orphan Fund, so far as securing the benefits for orphans is concerned. That is the point to which I would draw attention, because it is obvious, if such is the case, English subscribers will do much to help remove that impression if they secure the election of Mr. Rust's Irish *protégé*. It would be indeed a misfortune were Scotch, Irish, and Welsh gardeners or horticulturists led to believe that their efforts to secure the election on to the

FIG. 11. THE SHUTTLECOCK FERN.

Orphan Fund of some suitable candidate would be in all cases swamped by the enormous proportion of English votes. Gardeners in Ireland, Scotland, and Wales, though excellent men, are not so numerous relatively, nor have they such good wages generally as English gardeners; hence, whilst the comparative fewness of subscribers from these countries is to be deplored, it is to some extent explained. Still, it does seem as if, were greater confidence in the impartiality of the English subscriber inspired, a much larger number of subscribers from the sister kingdoms would result. Neither Ireland or Scotland have a vice-president representative, but Wales has Sir J. T. D. Llwydell. Still, there is not a single representative from either of the allied kingdoms on the executive committee; but it can easily be understood that such representative, if elected, could rarely attend. Scotland and Ireland each have four local secretaries, who are honorary members of the committee; and Wales has two. Still, it does seem as if direct members of the executive, such as Mr. Dunn, for Scotland; Mr. Bradshaw or Mr. Dumper, for Ireland; and Mr. Muir or Mr. Pettigrew, for Wales, were appointed, good would result, and a strong sense of confidence created. It is worthy of note that so far every child on the Fund now is from some English district. *A. Dean.*

SHRUBBY CALCEOLARIAS.—These plants should be removed from the cutting-frames before becoming drawn, and planted out in a well-sheltered aspect. It is a good plan to plant them in shallow trenches, with a layer of short dung at the bottom, this being

covered with 6 inches of moderately light loamy soil. By this mode of treatment the plants at planting-out time are furnished with a compact mass of roots and soil. Plant firmly at about 6 inches apart, and pinch out the tops, if this has not been done. Whilst in the cutting-frames, some slight protection against frosts will be necessary, a slight amount of shade will be necessary during bright sunshine. See that the plants do not suffer from dryness at the root, and sprinkle them lightly at the close of warm days. The culture of these plants has declined of late years, on account of their dying off suddenly in summer time, and the shortness of their bloom in hot seasons. *Golden Gem*, a variety which I grow, is dwarf, robust, and very productive of flowers. Early planting, much manure, and a deeply-worked soil, that should not be allowed to get very dry, suits the *Calceolaria*; and in hungry soils, occasional applications of manure-water are beneficial, after the plants have become established. *H. Markham.*

ALEXANDERS.—The old-time pot-herb, called "*Alexanders*" (*Smyrniolum olusatrum*), is abundantly naturalised near Dublin—indeed, all over Ireland—on or near the sites of old abbeys and other religious foundations. What is the golden fungus which gives to it such a bright yellow variegated effect, as now growing on the Sutton or sunny side of Howth Head, a peninsula extending on one side of Dublin Bay? It may be very common—I should say it is—but it is unknown to *F. W. Buchholz*. [See our answers to Correspondents in our last issue for the name of the fungus. *Ed.*]

THE SHUTTLECOCK FERN.—The *Struthiopteris* are among the finest and most noble of the hardy Ferns, as they attain a large size and are of striking appearance, the fronds generally attaining a length of 3 or 4 feet, and are so arranged, that the plants have the appearance of shuttlecocks. The outside fronds are of a beautiful pale shade of green, and are barren, the fertile ones appearing later in the season in the middle of the plant, and being of a dark brown colour, they are conspicuous. Towards the autumn, these fertile fronds become of a still richer shade. Although this species of *Struthiopteris* will grow almost anywhere, the most suitable place for it is one which has moisture and a porous soil, on which the creeping stolons extend themselves very fast, and soon form quite a colony of plants. Not only do such situations favour growth and development, but the plants are kept much healthier, they not being so much subject to thrips or red spider. The *Struthiopteris* are early to start into growth, and the spot should be a sheltered one, or the early fronds will get cut by cold winds. *S. pennsylvanica* is the larger of the two, and with *S. germanica* should be in every garden and freely planted, as well as grown in pots for grouping or embellishing greenhouses during the first months of the season. *J. S.*

EFFECT OF FOG ON PLANTS.—I was much interested by the notes on the subject of fog by your able correspondent, Mr. Hudson, in last week's *Gardeners' Chronicle*; as it fully corroborates my own experience. I was once under the impression that the effects of fog were often exaggerated, and that failures were due in some instances to other causes; but having had two winters and springs in this locality, and having to do a lot of early forcing, I have good reason to change my views. In fact, I believe we suffer more in this respect than Mr. Hudson, as we are much lower than he, and only a few feet above the river level, consequently fogs remain longer with us. I have had the same trouble with Strawberries, and thought that perhaps I should be more successful with another variety; so this season I gave up the useful Keen's Seedling for Laxton's Noble and King of the Earlies for the earliest lot; but I would not advise any one to follow my plan. We gave the plants a nice mild bottom-dress of sweet Oak leaves, but I should have done better if I had used the house for other purposes, for every pot failed to fruit. Some certainly showed bloom, but after a few days of fog both the blooms and young leaves were affected. I shall now take Mr. Hudson's advice, and not attempt very early forcing, and keep to the well-known and proved varieties, namely Keen's Seedling and Vicomtesse Héricart de Thury for fruiting at this date, using the latter for the first lot. We have a splendid set of Keen's at this date, and when about to start the early lot, in November, a few picked plants were placed with the others, but the plants failed to show bloom. I got the Laxton's potted up very early from runners taken off young plants that had all the

first blooms picked off to get strong runners for the purpose, and the plants were showing the bloom-spikes at the time of my housing them. I felt sure of success, but the result was the same: the foliage was strong but little bloom showed, although placed close to the glass, and the temperature was all that could be desired. The loss of a few Strawberries, although annoying, is not so serious as that of Grapes. The early forcing of these in this district has become a serious matter, especially as in our case Grapes are wanted all the year round. When in more favoured districts, where more light and sun are enjoyed, and less fog, this is not at all difficult; but around London if the gardener has only a limited number of houses, I feel sure he should not be expected to produce very early Grapes. With abundant means at our disposal we can only secure half a crop, and the Vines themselves do not last long; therefore I agree with Mr. Hudson that pot Vines are our best anchor; but these will produce little fruit if not of special goodness and strong. We use both pot and permanent Vines; the pots come in a short time before the permanent ones, and are useful, but we do not get such good bunches from them. The late Mr. Woodbridge adopted the method of planting canes and fruiting them the next season, restricting the roots to a small space and feeding highly, and after a couple of seasons' hard forcing planting new ones; some small pits were employed for this purpose, and the results were very satisfactory, as he used pot Vines, but was not dependent on one house only, for should fogs be prevalent at the time of setting the result is most disastrous, and there is the chance of a clear atmosphere for one of the houses. The effects of fog on the bunches is as described; they gradually turn yellow and curl up, and in a short time the ends drop off. The small amount of light and sunshine diffused around London is much against successful forcing, and when combined with fog, the operations are expensive. We have, after a few days fog, to wash the outside of the glass-house, and have the glass rubbed up with a brush before the fifth leaf has begun to be moved. The effects of fog on early Cucumber and Melon are equally disastrous, and one of its effects is to make the foliage thin and injuriously affected by the least amount of bright sunshine, so that it is necessary to have a succession of plants ready to make good the losses occasioned. *Orechids* suffer dreadfully—we had a house full of *Calanthes* in full bloom, and after two days of fog, the blooms dried up, and large numbers fell off. *Cypripediums* shrivel and lose their colour if they have been out only a few days. *Bouvardias* lose both their leaves and flowers. I was much surprised at this, the first winter after I came here, as I thought there must be mismanagement somewhere. I thought they had had too much tobacco smoke, but I was assured it was all due to the fog. I was giving them ordinary treatment, but this year I adopted the higher temperature for plants in bloom, and the plants do not suffer so much. Most of the plants I have named have suffered in a similar way, and we have endeavoured to ward off the evil effects, by a lopping a temperature a few degrees higher, and getting the winter blooming plants propagated early, so as to give them greater strength. *Camellias* do not, I find, drop the buds so badly if got into early growth; and many other plants which are weak do not survive through the winter months if propagated late. Tree Carnations are most difficult to keep in anything like a healthy condition if not strong at the approach of winter. My able predecessor gave up the cultivation of *Violets* in frames after several attempts to grow them. This is very disheartening, as gardeners in the country have very little trouble with these ordinary garden plants. The plants at the present date outside look very miserable, and scarcely a leaf or bloom to be seen, and yet up to November last they formed fine masses, and were grown on a warm raised border. The bad effect fog has on all newly-painted wood or iron is very marked. The paint requires renewing yearly in this district, and more oil must be used, as the continued washing and excessive moisture combined soon affect the wood if not well covered. I have no doubt that some suffer worse than others from the fog, and avoid growing any plants that are subject to its evil influences as much as possible, but this is not practicable in all cases. I have, in a few words as possible, given my experience, and the means I have taken to cope against fogs as far as I possibly could do so. *George W. Hines, Spina House, Epsom.*

LAWNS.—The month of April is almost too late in the spring to undertake the making of a lawn, still in northern districts it may still be done, and

a good even surface of verdure follow this late work. Never make a large extent of turf quite flat, as this would ruin it for walking on after rain; but give the ground what is called a "hanging level," or slope, however slight, to cause water the sooner to drain off. If the soil is not very rich, it will still make a good lawn; and if it be rather heavy in its nature, it should not be made lighter by the addition of sand, ashes, &c., as a lawn on stiff soil always keeps of a good colour in the driest of weather, whereas light soil is drained of moisture with rapidity, with the sure result of brown turf in warm weather. The one thing to be observed with heavy soils is to drain them well by pipe or rubble drains, and have plenty of catch-pits in the adjoining walks to carry off the water falling on the latter.

—Where lawns are almost taken possession of by a carpet of moss, I have found after experimenting with several remedies that nothing is so certain in its effects as a dressing of wood ashes. The effect is not immediate, but is seen in the course of the following summer; the moss disappears, and a thick sward of fine grass with a profusion of White Dutch Clover succeeds. In some places difficulty is found in obtaining wood ashes. In that case collect all the prunings of hedges, shrubs, bushes, and other waste materials of a similar nature that are found about most places, and burn them in a heap. Lacking wood ashes a thin sprinkling of lime may be applied, and afterwards one of soot. Some gardeners apply soot and lime mixed together, but this should not be done, as lime robs soot of its usefulness. Where verges or edges of grass from annual cutting have widened the walks to an unsightly degree, strip off the turf a foot wide, which should be cut to make good the turf to its original width. Prick up the soil lightly and make hard and relay the turf, but do not lay narrow strips of turf near to the walks. In extensive lawns there is seldom any attempt made to dig out the *Daisies*, except in the most prominent places; but in small places these are objectionable weeds, and are sometimes spaded out and got rid of in other ways. Some people do not think of doing this until the plants are in bloom, when by digging them out holes and bare spots are left which remain unsightly all through the summer. To avoid this, the proper time is March and April. After digging out the roots fill the holes with soil, and make firm afterwards, sowing Lawn-seed mixture. *A. Evans, Lipholt.*

HOME-GROWN SPIRÆA JAPONICA.—As I have been trying to grow these plants for some time, so as to secure a stock for forcing, I will relate my failures and ultimate success, for the benefit of your readers. Some imported clumps, after being forced, were planted out in due course on a warm border, where they grew fairly well, and the second year afterwards I took them up to force again; but they did not flower at all satisfactorily, and my employer thought the best place for them was in a neighbouring wood, but I thought I would try again, and this time the result was no better; so I had to think of some other plan. This time I planted them, last spring, on a north border, and as they were planted a good quantity of clayey soil was placed around their roots. The plants grew as well as one could wish, and on being taken up for forcing I was obliged to divide them with the spade before I could get them into 32s. I have now about fifty plants, measuring 2 feet across, which carry from twenty to thirty spikes of bloom—far exceeding the number I ever saw on imported plants. I have forced only half my stock this year, as I intend to have two lots of plants, forcing them each alternate year. It is to the rest the plants had that I attribute my success, and to the brick earth, into which they rooted very freely, and did not suffer from drought. *Alfred Bishop.*

LILIES OF THE VALLEY.—Londoners need not go to the eastern counties to find large Lilies of the Valley, although there can be no doubt whatever but that Mr. Jannoch, of Dersingham, has succeeded in showing that as fine Lily crowns can be produced in England as in Holland. My example is found at Twickenham, where, as has so often been mentioned, Messrs. Hawkins & Bennett grow their fine Victoria Lily of the Valley in beds, and which produce crowns equal to the best to be purchased anywhere. Lilies of the Valley need a few years to get them into that high condition of development essential for market value; but then, on the other hand, what other plant is so valuable over a rod of ground as is the Lily. Literally where well grown thousands of fine crowns may be taken from a rod of soil, the value being great, because a market can always be found for the roots—

where, as in this country, so largely employed for forcing. It is true that at Twickenham the firm which produces such splendid Lilies of the Valley prepares the beds by excavating the soil and making new ones absolutely, but they are driven to that contingency for want of room. If they set out to grow roots for market sale, as Mr. Jannoch does, no doubt they would go further afield and secure fresh soil, but that is not possible, therefore the fresh soil is brought to them. The beds are about 6 feet in width, that they may be protected by frames and lights in the blooming season; but although the plants are densely crowded, yet annual top-dressings of manure put on in the winter with plenty of water given in dry weather, keep the beds in the finest of growth for some eight or ten years, when they are broken up and re-made. We ought to be able to utilize for our Lilies of the Valley occasional sewage floodings, for the roots are gross feeders and well repay feeding. *A. D.*

LACHENALIA PENDULA.—An effective way in which to grow this plant is in a basket, the natural droop of the leaves and flowers fitting it admirably for this purpose. At the present time we have a pair of baskets in the conservatory whose diameter is 2 feet 6 inches and their depth 2 feet, and 300 fully-expanded spikes of greenish-yellow are visible, and many buds at the tips of the bloom-spikes; the baskets are quite hidden under the mass of foliage and bloom. *Lachenalias* require a very small amount of skill to grow, and are so free from noxious insects that it is a wonder that they are not more commonly grown as basket and pot plants. If the baskets in which they are grown are large, it is not necessary to remove the tubers for the purpose of adding new soil every year, each alternate year being often enough to transplant them, providing manure-water is supplied when growth is most active, which is when the flower-spikes are appearing. Circular baskets give the best effects, and if these are 12 or 13 inches deep they will be large enough—ours are made of No. 9 galvanised iron wire. The side-wires are fixed to the circle at the top, at 2 inches apart, and the basket is suspended by four looped wires, and fixed to a hook in the roof timber. After flowering, the baskets are removed to a cool house, and less and less water is given to them until the foliage dies off. The baskets are then hung up in the potting-shed, where they remain without any water being given to them until near the end of the month of September, when roots begin to form, and new growth to take place. The bulbs may then be removed and sorted into two sizes, the smaller ones being reserved for other baskets, or potted six or eight in a 5-inch pot, to increase in strength. When filling a basket, suspend it close to the potting-bench; cover the bottom of the basket with long green moss and a layer of compost, consisting of turfy loam three parts, leaf-soil and horse-dung one part, and some silver-sand. It is not necessary to place any of the bulbs actually at the bottom, but the first row may be placed at 3 inches away from the centre; the leaves and spikes of flower from the first row will fill the lower space. The bulbs should be placed in layers 2 or 3 inches apart, allowing the point of the growing shoot to protrude through the moss horizontally, and continue to plant in layers until the basket is full, when a few strong bulbs should be planted upright, so as to cover the top. The soil should be moist, so that no water will be required for several days, when a thorough soaking may be given, and afterwards as often as water is needed. The baskets may be hung in any cool light house until the bulbs begin to flower. Forcing is detrimental to the appearance of the plant, and should not be practised. *E. M.*

BOOKS AND SPECIMENS AT THE NARCISSUS CONFERENCE.—It would be most interesting if an exhibition of the books, especially the older ones, relating to the history of the Narcissus as a flower, could be made in connection with the Narcissus Conference, to be held at Chiswick, April 15, 16, 17, and 18. The works of some of the "old masters" such as Gerard, Parkinson, Sweet, Crispin Passe, jun., "Hortus Floridus." The rare *Jardin du Roy*, and the still more rare *Campy Ellysic*, vol. ii., of the *Rulbecks*, *Barrellier's L'ouvres*. The *Theatrum Floræ* is another rare folio containing splendidly etched figures of Narcissi, including the newly re-introduced *N. cyclamineus*, and the enormous elephant folio *Hortus Eystettensis*, would also of itself form a most interesting feature. Perhaps the Director of the Royal Gardens, Kew, could oblige us in this

matter, or add to the botanical interest of the exhibition by exhibiting dried specimens or drawings (of the wild species of Narcissus), as he so generously did for us at the Chrysanthemum Conference last November? At any rate, the subject of rare books and authentic wild specimens and illustrations seems worthy of consideration in connection with the reading of papers, and the exhibition of cultivated species and forms. *F. W. Burbidge, F.R.H.S.*

BERRIED AUCUBAS AT CHISWICK GARDENS.—Some years ago the late Mr. John Standish contributed to the columns of the *Gardener's Chronicle* a suggestive paper on "Evergreens for Towns," and in it he strongly recommended the use of *Aucuba japonica* for town planting, and he particularly recommended that in the London squares there should be planted the dark green-leaved varieties of both sexes, regarding them as much more handsome than the variegated forms, and predicting the time when if the types be named were planted, they would be seen "loaded with their rich coral-like berries." In the several beds and clumps of *Aucubas* at Chiswick, Mr. Barron has planted male *Aucubas* in the centre, surrounding these with a line of the variegated female *Aucuba*, a dwarf green-leaved type known as vera being used as an edging plant, and which are as well berried as the others. The leaves of *A. feminea* vera being small, the large and numerous clusters of bright red berries show prominently. Plants of this type are worthy of being grown in pots for conservatory decoration, and although the male forms bloom much earlier than the females—apparently before the flowers of the latter are sufficiently developed to become impregnated with pollen—the same slow fertilisation is accomplished. As the Japanese *Aucuba* is an excellent London plant, it is no reason why the successor to John Standish should not see his own words exemplified:—"Only fancy the London squares lighted up with such plants loaded with their coral-red fruit from Christmas until June." *R. D.*

SOCIETIES.

ROYAL HORTICULTURAL.

April 8.—At the Royal Horticultural Society's meeting, held on Tuesday last in the Drill Hall, at Westminster, there were comparatively few exhibits, and nothing specially remarkable.

Mr. W. Ingram, of Belvoir Castle Gardens, Grantham, read an address on "Spring Flower Gardening," in which he alluded to the plants he employs in the now well-known spring flower garden at Belvoir Castle. The lecturer was attentively listened to by a large company, whilst in a chatty style he described the colour, height, habit, and length of flowering of his favourite plants, and showed how much floral and leaf beauty may be added to our gardens by a large increase of the flowers of spring.

An account of the spring flower garden at Belvoir is given in our issue for May 22, 1880, p. 460, and many other notices occur in previous issues.

The lecture was efficiently illustrated by living plants kindly supplied by Messrs. Paul & Son, Cheshunt.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. S. Hibberd, T. Baines, H. Herbst, C. T. Drury, T. W. Gardstone, B. Blair, H. B. May, R. B. Lowe, C. J. Jeffries, B. Wynne, G. Paul, F. Ross, and Rev. H. H. Doornbrain.

A nice and pleasing group of pot Roses was sent by Mr. W. Rumsey, Joynings Nursery, Waltham Cross. The plants were well grown and flowered, and comprised such varieties as Madame Marie Rhodocanthi, Charming Niphetos, Lady Mary Fitzwilliam, Miss Hassard, Duke of Edinburgh, and General Jacquemont. Also a box of some handsome cut blooms, including Mabel Morrison, Savenir de la Malmaison, Innocente Proda, Séniateur Vaisier, Duke of York, &c. Messrs. Paul & Son, Old Nurseries, Cheshunt, contributed largely to the display, having a number of alpine plants in pots, a small collection of flowering shrubs, a group of *Amaryllis*, and three standard hardy *Azaleas*, which were laden with well-developed bloom. Other plants were *Ribes cuneifolium*, *Berberis Darwinii*, *Troop Paeonies*, *Talpa Greigi* var., alpine *Auriculas*, a fine lot of *Doronicum plantagineum* excelsum, *Tecophylla cyanocrocus*, with a beautiful

blue flower; *Fritillarias*, *Caltha minor*, *Saxifragas*, a pot of *Psydanthera barbata*, which forms a dense tuft, and bears white flowers having five petals. There were some thirty plants of *Amaryllis* from this firm, and they made a brilliant show, having well-coloured flowers, of moderate size, and fairly dwarf. Tritium, white ground, with heavy crimson edge, was one of the most striking.

Old-fashioned greenhouse plants were sent from the collections in the Royal Gardens, Kew, and included some useful old favourites, which, when well grown and flowered, make a good effect, and are useful for all cool conservatories. Among others were *Banera rubroidea*, *Agapetes buxifolia*, *Gondia latifolia*, *Macaya bella*, *Grevillea Thellermaniana*, *Eupatorium atro-rubens*, very showy; *Polygala Dalmaisona*, *Chorig-ma varium*, full of its brightly-hued flowers, and many others of a similar character.

A number of alpine *Primulas* were contributed by O. T. Hodges, Esq., Lachine, Chislehurst; they were healthy, well-grown examples, and bore nicely-coloured flowers. The following species were in the collection:—*P. alba nitens*, *P. verticillata*, *P. marginata*, *P. rosea*, *P. viscosa*, *P. pubescens alba*, *P. glaucescens*, *P. tyrolensis*, &c. Half-a-dozen pots of *Lachenalia Nelsoni* were also sent by this exhibitor.

Two handsome *Amaryllis* came from Messrs. J. Veitch & Sons, Royal Exotic Nursery, King's Road, Chelsea, S.W. *Dante*, white with red flush and band, was very fine; and in *Grand Monarch*, was a large flower of deep red down to the very base of the perianth segment, which makes this a desirable variety. *Primrose*, Oakwood Blue, was sent by G. F. Wilson, Esq., Oakwood, Weybridge, it is a seedling from Scott Wilson, and has flowers of dark plum-colour with a conspicuous yellow eye. Mr. Hudson, gr. to Messrs. the Royal Hort. Soc., Orchard House, Acton, sent flowering branch of *Mazodola conspicua*, a very handsome shrub, *Habenaria muscaria*, *Scilla*, and *Manantia Waterhousei*. Mr. Wilkins, gr. to J. M. Peas on, Esq., The Cottage, Kingston Hill, Surrey, sent a few varieties of *Primrose*, and Mr. R. D. Blair, Esq., also contributed a few varieties, one of which, *Terra Cotta*, a *Polyanthus* form had flowers in which red and brown were charmingly combined. The Rev. W. Wilks, Surley Vicarage, Croydon, sent an example of *Cytisus Alami* from the Laburnum. Representative collections of *Daffodils* were staged by Mr. Walker, Whitton, and by Messrs. Barr & Son, Covent Garden, and a few considerably to the display.

Orchid Committee.

Present: D. M. T. Masters in the chair, and Messrs. De B. Crawley, D. M. Pellett, H. Ballantine, C. J. Fisher, J. Denney, E. Hill, L. Castle, S. Carttall, J. Douglas, A. H. Snow, J. O'Brien, T. B. Hayward, and E. Dean Schrader.

From Mr. P. Blair, Planting Gardens, Stoke-on-Trent, came a small collection of nicely-grown and well-flowered *Orchids*. There were the hybrid *Dendrobium chrysocentrus* with seven flowers, *Dendrobium nobile nobiliss*, and *D. n. Cooksoni*, both with very finely flowered examples. *Cattleya Triana*, a Thomson variety, with tall flowers of delicate hue, the lip being very brightly coloured; also *Odontoglossum flavescens* and *O. triumphans*, with large flowers.

Mr. W. H. Young, gr. to F. Wigam, Esq., Clare Lawn, East Sheen, also sent a pretty group, in which a fine plant of *Cattleya Schoderi* was conspicuous, others being *Angara Leonis*, *Lacoste Harrisonae*, *Cypripedium hirsutissimum*, and *C. saxissimum*, all very creditable examples.

E. Ellis, Esq., Manor House, Wallington, gr. to Mr. T. A. Glover, had a very good piece of *Arides saxissimum*, bearing four spikes of bloom, the flowers being of a delicate rose colour with the lip of yellow.

From the collection of I. G. Tautz, Esq., Shepherd's Bush, W. gr. to Mr. C. Crowley, there were sent *Miltonia vexillaria*, a form having large flowers of rose with a white border, *Cattleya Lawrenceana*, rosea, with richly coloured flowers, and a well developed piece of *Cypripedium selligerum majus*.

Mr. G. Palmer, gr. to F. H. Powell, Esq., Drinkstone Park, Bury St. Edmunds, sent a bloom of a good coloured form of *Odontoglossum Pescatorei*.

The Rev. — Handley, Bath, gr. to Mr. Veerstedde, sent a fine form of *Odontoglossum crispum*, with large flowers; *Angraecum sesquipedale* with six blooms, and a plant of *Odontoglossum maculatum* with five large flowers. A pigmy *Cypripedium niveum*, having flowers only 1½ inches across, was sent by

Messrs. J. Laing & Sons, Forest Hill. A very interesting object was sent by Messrs. J. Veitch & Son, Chelsea, the plant being *Dendrobium atro-violaceum*. The specimen exhibited had one erect raceme of five flowers, which are carried in a drooping manner, the stems about 12 to 15 inches in height with no leaves; the petals are 2 inches in diameter, yellowish, the flowers are 2 inches across, narrower, and both spotted with violet, the lateral lobes of the lip are ascending greenish-yellow outside, streaked heavily with violet within, the median lobe also being streaked and dotted. A Botanical certificate was awarded to this plant by the Scientific Committee.

Fruit Committee.

Present: Sir C. Strickland, Bart., in the chair; and Messrs. P. Crowley, R. D. Blackmore, T. F. Rivers, W. Warren, J. Smith, J. Wright, A. Watkins, G. Wythes, H. Balderson, H. Weir, J. Hudson, and J. Choul.

A few fine fruits of Laxton's Noble and Auguste Nicaise Strawberry came from Mr. James Smith, Mountmore Gardens, Leighton Buzzard. Mr. Miller, gr. to Lord Fowley, Esher, sent a fine lot of Mushrooms; and from the Society's Gardens, Chiswick, came a collection of Broccoli, Purple Sprouting, Longington, and Sutton's Dwarf being very good.

Awards were made as follows:—

By the FLORAL COMMITTEE.

Books of Merit.

To *Psydanthera barbata*, from Messrs. Paul & Son.

To *Primrose Oakwood Blue*, from G. F. Wilson, Esq.

To *Polyanthus Terra-cotta*, from Mr. R. Dean.

To *Amaryllis Grand Monarch*, from Messrs. J. Veitch & Son.

Medals.

Silver Bankian, to Mr. W. Rumsey, for group of Roses in pots; to Mr. J. Walker for collection of *Daffodils*; and to Messrs. Paul and Sons, for a group of plants in flower.

Bronze Bankian, to O. T. Hodges, Esq., for a group of *Primulas*.

By the ORCHID COMMITTEE.

Medals.

Bronze Bankian, to F. Wilson, Esq.; and to Mr. B. Blair.

By the FRUIT COMMITTEE.

Book of Merit.

Strawberry Auguste Nicaise, from Mr. J. Smith.

ROYAL CALEDONIAN.

April 2 AND 3.—This Society held its spring show in the Waverley Market, Edinburgh, on Wednesday and Thursday last week. The weather was auspicious on both days, and the event was a success financially. Few finer shows have been held by this Society. The competitive groups of plants for effect in the nurserymen's class were placed on the floor instead of being elevated on tables two feet or more in height as had been done formerly. The groups themselves were better seen; they presented less obstruction to the general view of the show. In the class for a group of plants of 100 square feet, Messrs. Laird & Sons and Messrs. Inland & Thomson were the only competitors, and they were placed by the judges in the order named. *Paeonia*, *Ferns*, and other foliage plants, *Azaleas*, *Hebe*, *Cytisus*, *Rhododendrons*, *Syracusa*, and the usual flowers of the season, natural or forced, were included.

An attractive feature was the table of *Primula Sieboldii* varieties, set up with taste by Messrs. Ryder & Son, of Sale, near Manchester. The plants were arranged in pans of about 12 inches diameter, plunged in a bed of fresh green moss, sloping towards the spectator, the boxes springing erect to the height of from 6 to 9 inches in well defined circular masses, displayed charmingly their bright and varied colours. It was a charming display.

Mr. John Downie of Beecothill Nurseries, Edinburgh, exhibited a fine lot of large-flowered *Cinerarias*. Messrs. Methven & Sons, Princes Street, Dicksons & Co, Waterloo Place, James Dickson & Son, Hanover Street, Edinburgh, each contributed attractive tables of flowering and foliage, greenhouse and stove plants, intermixed with forced and hardy flowers, which by their gay colours and excellent arrangement, added much to the beauty of the show.

Forced flowering plants were in great abundance. In the class for twelve plants, the competition was keen, Mr. McIntyre, The Glen, Innerleithen, Mr. McKinnon, Melville Castle, and Mr. Laing, Salisbury Green, shared the honours in the order named. In the collection of the last-named competitor was a very perfect plant of the Scotch variety of *Labium*, very well flowered, which should induce others to make free use of it for exhibition and home decorative purposes.

Indian Azaleas were represented in about their usual numbers and styles. In the larger class of four specimen plants, Mr. Paterson, Milbank, took first honours; Mr. Bald, Canaan House, and Mr. Grossart, Oswald House, were 2nd and 3rd in their order. In the smaller class of two specimens, Mr. McLennan, Restalrig House, came to the front, with Mr. Copeland, Orwell Lodge, a good 2nd. The class of four plants in pots not exceeding 8 inches, placed Mr. Paterson again victor, followed by Mr. Copeland, and Mr. Donaldson, Murrayfield, in their order.

Stove and greenhouse plants were in about the usual form at these shows, and the familiar names of Paterson, Bald, Grossart, Fraser, Canaan Park, and McKinnon, were the principal prize takers.

Cap. Heaths.—In the case of four distinct varieties, Mr. Paterson was an easy 1st; 2nd, Mr. Bald. Mr. McKinnon had no competitor in the class for two distinct, but his plants would have been hard to beat had there been more candidates for places.

Azalea mollis, these in all classes were generally so well exhibited in regard to quality, that comment is needless. Mr. Paterson and Mr. Henderson, Clermiston, and Mr. McIntyre distinguished themselves in the order named in the larger class of six plants distinct; while in the class of three standards, McKinnon was placed 1st, and McIntyre 2nd, having the competition to themselves.

Orchids were neither numerous nor very remarkable. The best six came from Mr. Grossart, and comprised *Cypripedium Warneri*, *Lycaste Skinneri* alba, fresh and well bloomed; *Dendrochilum glutinaceum*, *Cattleya Lawrenceana*, and *Cymbidium Lowii*, all in good form. The best three were set up by Mr. McIntyre.

Ferns were numerous, and as usual, well done; there were eight classes. The principal prize takers were Mr. J. Napier, Rockville, whose four distinct exotics took first prize; A. Crichton, Southfield, first in the class of two distinct; Mr. Paterson 1st for three *Gleichenias*, distinct; Mr. Anderson, an amateur, Edinburgh, 1st for three filmy Ferns, which were very fine; the same competitor also taking 1st for six dwarf British Ferns, which were altogether admirable; and Mr. Laing took 1st in the class of Tree Ferns.

Roses were an excellent show, marking an advance on the numbers and quality of some recent years. The best six in pots were tabled by Mr. Paterson; and the best three in pots came from Mr. Johnstone, Sillerton Hall, Hawick.

The best twenty-four cut blooms were set up by Mr. Henderson; the best twelve by Mr. Wynter, Rockville, Linlithgow; the best twelve *Gloire de Dijon* by Mr. Chalmers, Davidson's Mains; and the best twelve *Maréchal Niel* by Mr. T. Fender, Creiff.

Hyacinths.—In these there was a perceptible falling off in quantity, but generally there was better growth, though hardly the usual excellence of finish. The 1st prize twelve in the gardeners' classes were set up by Mr. McBean, Johnstone, Renfrewshire, who also took the same position in the class of eight; and in the class of six, Mr. George Lawrie took the 1st place. In the amateurs' class of six, Messrs. Adam Brydon, Tweed Bank, Innerleithen; John Barrie, Jock's Lodge; and R. McKean, Norton Place, took honours in their order.

Tulips.—These were generally excellent and plentiful, and gardeners and amateurs entered the lists against each other. The leading prize takers in the several classes were Grossart and Barrie.

Fruit was scarce. Mr. McIntyre tabled the only Pine, and Mr. Dow the only six pots of Strawberries. The finest thirty Strawberries were from Mr. McIndoe, Hutton Hall, Gaisburgh, being Laxton's Noble, which for colour and perfection of form were the admiration of all. Mr. Smith, Oxenford Castle, and Mr. McIntyre were 2nd and 3rd respectively. For two bunches of black Grapes, Mr. McIndoe took 1st place; Messrs. Smith and McIntyre being 2nd and 3rd. The 1st prize for twenty-four kitchen Apples went to Mr. Potter, Secliffe, N. Berwick, who also took 1st position with twenty-four dessert Apples. The best twelve dessert Pears were put up by Mr. Robertson Hartridge, Jedburgh, who also tabled the best twelve kitchen Pears.

Vegetables.—The collections of twelve distinct kinds were numerous, and of high excellence. They each comprised samples of forced Asparagus, Kidney Beans, Seakale, Potatoes, Rhubarb, and the three which took the allotted prizes, have never been surpassed in quality at this season here. The prize winners in their order were Mr. Robertson, Mr. Cairns, Bonjedward, Jedburgh, and Mr. G. Potter. The best collection of salads came from Mr. T. Milne, Sunnybank Cottage. The best brace of Cucumbers from Mr. McIndoe; the best pint of Mushrooms from Mr. Thorburn, Valleyfield, Penicuik. The best fifty pods of Kidney Beans from Mr. J. Cossar, Spot House, Dunbar; the best twenty-five Asparagus from Mr. Crichton; the best six heads Seakale from Mr. Robertson; the heaviest six stalks Rhubarb from Mr. Thomson, Ferry Road, Leith; the best twelve forced Potatoes from Mr. S. Bigham, Jedburgh; the best three Broccoli from Mr. Dow, New Byth; the best twelve Onions from Mr. Johnstone; the best six Leeks from Mr. R. P. Brotherton, Tringhame; the best six Beet from Mr. Gourlay, Musselburgh, &c.

Narcissus classes were, as usual, good, and honours in them keenly contested. At the outset we have noted the leading class in this section—the group for effect. Messrs. Laird & Sons had no competition in the class of twelve hardy *Rhododendrons* in pots or tubs which were grand, tree-like specimens, splendidly flowered. Messrs. Ireland & Thomson were an easy 1st, with twelve hardy *Rhododendrons* in pots not exceeding 12 inches diameter. The 1st prize for two *Camellias* in bloom went to Messrs. Laird & Sons. Messrs. Ireland & Thomson were an excellent 1st, with four *Azalea indica*; they also excelled with their twelve dwarf *Azalea mollis*, but were beaten by Messrs. Laird & Sons with six standards of that species. Messrs. James Dickson & Sons took 1st prize for twelve *Conifers* in tubs or pots. Laird & Sons were again placed 1st with six *Palms*, also with three *Crotons*, and three *Dracenas*. Two Tree Ferns brought Messrs. Dickson & Co. to the front, and twelve table plants again gave the leading position to Messrs. Laird & Sons, who were also 1st with four new and rare plants.

For twenty-four *Hyacinths*, the 1st prize was earned by Messrs. Kerr & Sons, Roxburgh.

For six *Tulips*, Messrs. Laird & Sons were 1st, as also for six pots of *Narcissus*.

In the two classes of twelve cut *Roses* distinct, and twelve *Maréchal Niel*, Mr. Bryson, Helensburgh, had the running to himself.

Primulas of sorts, including *P. obconica*, the hardy *Primroses* and *Polyanthus*, &c., were with the exception of *Auriculas*—which were very indifferent samples—more numerous and better presented than they generally are at these shows. The collections of alpine plants also were pretty numerous, although species questionably alpine are too freely admitted in the category by the judges and committee. The educational effect of competitions of this kind is, may be permitted to remark in passing, very unsatisfactory when an *Arabis asarifolia* is permitted to stand for two days labelled *Saxifraga* without being corrected.

The collection of hardy spring flowers of Messrs. Munro & Ferguson, set up in competition, was rich in good old and new and rare things of this kind, and had the 1st prize awarded to it. At one end of the table was a small collection of interesting spring flowers from Mr. Boyd, of Fauldonside, Melrose, among which was a spike of flowers of an alleged hybrid between *Scilla bifolia* and *Chionodoxa Lucidifolia*. The inflorescence and ovary were those apparently of the *Squill*, while there was little besides a paling down of the blue to almost a white tint at the base of the perianth to show any resemblance to the other alleged parent.

An interesting collection of *Dalrids* was exhibited by Messrs. Peter Barr & Son, London.

SCOTTISH HORTICULTURAL ASSOCIATION.

The ordinary monthly meeting was held in the lecture hall of the Young Men's Christian Association, St. Andrew Street, Edinburgh, on the 1st inst., Mr. Morrison, Vice-President, in the chair. The Rev. Mr. Marjoribanks, of Preston Kirk, gave an interesting popular lecture on "A Trip Across America to California and Alaska, Returning by the Canadian Pacific Railway."

Exhibitors on the occasion were sent in by Mr. James Mathieson, gr. to Mr. Buchanan, Currie Hill,

of beautiful examples of *Schizanthus pinnatus*, and S. Grahami. Some sixteen varieties of hybrid *Rhododendrons*, exhibiting the blood of R. Thomsonii, R. Campbellii, and R. arboreum, were sent in by Mr. Morris, Hay Lodge, Trinity. They were mostly deep reds, with large campanulate blooms, which were very effective. The same exhibitor had also a truss on the table of a large trumpet-flowered *Rhododendron*, said to be the result of first crossing R. formosum with R. ciliatum, and re-crossing the progeny with R. Edgeworthii.

LIVERPOOL SPRING FLOWER SHOW.

APRIL 8 AND 9.—Just after the Easter holidays, the Liverpool Horticultural Association decided to hold their spring show. It took place in St. George's Hall, a place eminently fitted for showing plants and flowers to the best advantage. Three longitudinal tables did duty in the area, and the wings at the side were relegated for the larger specimens sent for competition by gentlemen gardeners. As a whole, it was a floral show, not without some large plants to tone down any squat formality.

The principal showy plants came from the greenhouses of the gentlemen about and around Liverpool, Mr. B. Cromwell, gr. to Mr. Timms of Allerton, had splendidly grown plants of such as *Dendrobium nobile*, *Clerodendron Balfourianum*, *Kentia Fosteriana*—particularly fine, and *Croton Disraelii*. In addition to these, he had capital *Azaleas*, of which Madame Ambrose Verschellit was in best condition. He had also a capital plant of *Francesca amperiflora*, of *Rhododendron Veitchianum*, of *Erica Devoniana*, bristling with crimson tubular blossoms. Mr. Jellicoe, gr. to Mr. Essage, had very fine plants of *Cycas revoluta*, the pure white fragrant hybrid *Himalayan Rhododendron*, a capital *Dioa edule*, *Rhododendron Gibsoni* covered with bloom, and several other good plants. Mr. Winkworth had a fine example of a really effective hardy *Rhododendron* called *Phantom*. Mr. McKelvin, had grand plants of *Davallia Mooreana*; excellent example of *Azalea mollis* were staged from Mr. Morris, gr. to Mr. Jones. Mr. H. Wales, Eden Hall, had a striking specimen of *Calamus ciliaris* and of *Kentia Delmoreana*. Mr. Bonnds had the best *Azaleas*, and Mr. James Kelly showed a well-grown and flowered plant of standard *Azalea*, after the style of *Apollon*. *Lachenalia pendula*, grown in a basket, and suspended, clearly showed that this was a good system, as the habit of the plant, and the quantities of pendulous flowers of yellowish-green, took the eye much better than when presented on a level. Mr. L. E. Bahr had excellent hybrid perpetual *Roses*.

Among *Orchids*, which were comparatively numerous, and briskly competed for, Mr. Osborn, gr. to Mr. Robinson, Woolton, had the best, his *Odonoglossum crispum* and *Cypripedium calceolatum* were particularly noteworthy. Among others were *Odonoglossum Elvridgii*, *Cattleya Trianae*, *Dendrobium Wardianum*, *Chysis bracteata*, and several well-known *Dendros*. For the best single specimen, Mr. Smith, gr. to Mr. Y. Varrondo, took 1st with a well-grown *Phalenopsis amabilis*, but a poor variety. Mr. Jellicoe was 2nd, with a well-grown plant, properly flowered, of *D. Jamesianum*; and Mr. Thomas Wilson was 3rd with *Yanda suavis*, with three spikes of bloom.

Hyacinths were past their best, and the general bulb classes were only indifferently represented.

Roses were good, the cut *Maréchal* and *William Allen Richardson* very fine indeed, from Mr. John Campbell, Mersey Road.

The other exhibitors were the Liverpool Horticultural Company, with a variety of excellent articles for general decoration. Messrs. Davies & Son, Wavertree, with a lot of bulbous plants, among which were several well-flowered *Amaryllis*, and other useful plants. Ryder & Son, Sale, had an excellent group of *Primula Sieboldii*, really an excellent decorative plant in a great many shades of colour, which won the plaudits of the visitors.

CATLEYA TRIANÆ.—M. Lucien Linden sends us a flower with the segments in pairs instead of in threes. There is no ovary, two sepals placed laterally, two lip-like petals placed at right angles, and an erect column, without an anther. A similar malformation is very common in *Orchids*, and is the result of arrest of growth and suppression. Some who are fond of speculation, suppose that such flowers indicate a descent from some more simple stage.

MARKETS.

COVENT GARDEN, April 10.

The holidays are still making our business very dull, especially with forced goods. James Webber, Wholesale Apple Market.

FRUIT—AVERAGE WHOLESALE PRICES.

Table with columns for fruit types (Apples, Grapes, etc.) and prices per bushel or dozen.

VEGETABLES—AVERAGE RETAIL PRICES.

Table with columns for vegetable types (Asparagus, Beans, Beet, etc.) and prices per bushel or pound.

POTATOES.—Old Potatoes have been selling freely at the low prices. Tendrils for New ones, much lower prices. Heavy arrivals are due this week. J. B. Thomas.

PLANTS IN POTS—AVERAGE WHOLESALE PRICES.

Table with columns for plant types (Araha Sieboldii, Arum Lilies, etc.) and prices per dozen.

** Bedding plants in variety in boxes, and also in pots.

CUT FLOWERS—AVERAGE WHOLESALE PRICES.

Table with columns for flower types (Abutilons, Anemones, Bouvardias, etc.) and prices per dozen.

ORCHID-BLOOM IN VARIETY.

SEEDS.

LONDON: April 9.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, London, report a steady demand for all kinds of seeds required for immediate sowing. All descriptions of Cloverseeds are now obtainable at remarkably low rates. Imported and perennial Rye grasses meet a brisk sale at previous low currencies. Of English Sanfain the supply seems all exhausted; fine French seed, however, can be bought on very moderate terms. Lucerne, like nearly everything else, is cheap this season. Tares realise last week's rates. Fine Blue Peas are getting into a narrow compass. Mustard and Rapeseed keep firm.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, for the week ending April 5.—Wheat, 28s. 8d.; Barley, 20s.; Oats, 18s. 1d. For the corresponding week in 1889.—Wheat, 30s. 1d.; Barley, 25s. 4d.; Oats, 17s.

FRUITS AND VEGETABLES.

SPITALFIELDS: April 9.—Good supplies of all kinds of green stuffs. Moderate supply of fruit. Plentiful supply of Potatoes. Demand good for fruit and vegetables, but very dull for Potatoes. Prices.—English Apples, 4s. to 7s. per bushel; American Apples, 10s. to 22s. 6d. per barrel; forced Rhubarb, 1s. to 1s. 6d. per dozen bundles; natural ditto, 1s. 3d. to 2s. 6d.; do.; Seakale, 1s. to 1s. 6d. per punnet; Curly Kale, 4d. to 6d. per bushel; Spinach, 2s. to 3s. do.; Turnip-tops, 1s. to 1s. 6d. per sack; Swede-tops, 1s. to 1s. 6d. do.; Sprouting Broccoli, 6d. to 9d. per sieve; do., 1s. to 1s. 6d. per sack; Parsnips, 4d. to 8d. per score; Beetroots, 4d. to 6d. per dozen; Cauliflowers, 1s. to 2s. 6d. do.; Greens, 2s. to 3s. 6d. per dozen bunches; Turnips, 2s. to 2s. 6d. do.; Carrots, 1s. 6d. to 2s. 6d. do.; Cabbage Lettuce, 1s. to 1s. 6d. do.; Endive, 1s. to 1s. 6d. do.; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; Parsley, 2s. to 3s. per dozen bunches; Horseradish, 1s. to 1s. 4d. per bundle; English Onions, 4s. to 10s. per cwt.; Spanish do., 3s. 6d. to 12s. 6d. per case; Bordeaux do., 7s. to 7s. 6d. do.; Dutch and Belgian do., 5s. to 6s. 6d. per bag of 110 lb.; Carrots, 12s. 6d. to 30s. per ton.

STRAFORD: April 8.—Supply has been good during the past week, and a fair trade was done at the following prices—Savoys, 3s. to 5s. 6d. per tally; Cauliflowers, 6s. to 11s. 6d. per crate; Turnips, 25s. to 35s. per ton; Carrots (household), 25s. to 40s. do.; do. (cattle-feeding), 18s. to 22s. do.; Mangolds, 15s. to 18s. do.; Swedes, 15s. to 19s. do.; Onions, English, 4s. to 10s. 6d. per cwt.; do. Dutch, 6s. to 7s. per bag; Apples, English, 10s. to 25s. per barrel; Watercress, 6d. per dozen; Cress (hot and cold), 9d. per dozen baskets; Celery, 4s. to 8s. per dozen rolls; Rhubarb, 1s. 6d. to 2s. per dozen bunches.

POTATOES.

BOROUGH AND SPITALFIELDS: April 8.—Quotations.—Regents, 40s. to 55s.; Hebrons, 30s. to 50s.; Magnums, blackland, 30s. to 40s.; Bedford, 40s. to 45s.; Lincolns, 40s. to 55s.; Yorks, 45s. to 80s.; Scotch, 47s. 6d. to 100s.; Imperators, 40s. to 70s. per ton.

SPITALFIELDS: April 9.—Quotations.—Magnums, 30s. to 45s. 6d.; Regents, 50s. to 65s.; Champions, 10s. to 17s.; Imperators, 30s. to 60s.; Hebrons, 30s. to 40s. per ton.

STRAFORD: April 8.—Quotations.—Scotch Regents, 55s. to 75s.; do. Magnums, 55s. to 75s.; do. light English Magnums, 45s. to 60s.; do. dark, 37s. to 45s. per ton.

HAY.

Averages.—The following are the averages of the prices obtained at the various metropolitan markets during the past week: Clover, prime, 70s. to 92s.; inferior do., 40s. to 75s.; hay, best, 60s. to 87s.; inferior do., 25s. to 50s.; and straw, 20s. to 35s. per load.

THE WEATHER.

THE PAST WEEK.

The following summary record of the weather for the week ending April 5, is furnished from the Meteorological Office:

"The weather has been very fine and bright in all parts of the kingdom, with fairly warm days, cold nights, and very dry air. At the close of the week, however, it had become less settled, and slight rain was experienced at our western and northern stations.

"The temperature has varied a good deal in different parts of the country; but, as a rule, it has been rather high during the daytime, and very low at night. The averages for the week were somewhat above the normal value over Scotland and in the north of Ireland; but in most other districts a slight deficit is shown. The highest of the maxima, which were recorded either on March 30 or April 5 over England, and on irregular dates over Ireland and Scotland, ranged from 65° in 'Scotland, E.' and 'England, S.W.', and from 61° in the 'Midland Counties,' to 57° in the 'Channel Islands.' The absolute minima were very low for the time of year, and occurred during the latter half of the period,

when they varied from 24° in the 'Midland Counties,' to 28° over the north of England and south of Ireland. In the 'Channel Islands' the lowest reading was only 41°. The ground frosts were very severe, the thermometer on the grass falling to 18° at Oxford on the night of the 1st-2nd, and to 17° in London on that of the 4th-5th.

"The rainfall was altogether absent until the close of the week, when slight amounts were registered in the western and northern districts.

"Bright sunshine has been more prevalent than for many months past, the percentage of the possible duration having ranged from 48 in 'Scotland, N.,' to between 60 and 70 in most other districts, while in 'England, S.W.,' and the 'Channel Islands,' 76 and 77 per cent. were recorded respectively."

[By the term "accumulated temperature" is meant a figure representing the aggregate amount, as well as the duration, of the excess or defect of temperature above or below 42° Fahr. for the period named; and this combined result is explained in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns for DISTRICTS, TEMPERATURE (Day-deg., Night-deg., Accumulated), RAINFALL (10ths of an inch), and BRIGHT SUN (In. Per cent.).

The districts indicated by number in the first column are the following:

- Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N. E.; 4, England, E.; 5, Midland Counties; 6, England, S.
Principal Grazing Ac. Districts—7, Scotland, W.; 8, England, N. W.; 9, England, S. W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

ENQUIRIES.

"He that questioneth much shall learn much."—BACON.
CARDAMINE FRATENSIS (CORIOLR Cuckoo-flower).
Will any reader of the Gardeners' Chronicle kindly supply Mr. J. Morton, surgeon, New Brompton, Kent, with a plant or two, the common single variety, as growing in woods and fields. Reciprocation is offered, and parcel-postage will be paid. Those who can supply the plant in request should kindly write first, to avoid duplications.

NOTICES TO CORRESPONDENTS.

* Owing to the large extension of our circulation, we are under the necessity of going to press at an earlier time than heretofore, and request our regular correspondents to favour us with their communications as EARLY IN THE WEEK AS POSSIBLE.

AMELOPUS, ROSES, &c.: W. W. A. SON. There is no disease, but the leaves appear as if injured by fumes—sulphur perhaps—or by the application of strong manures.

BELGIAN PLANTS: W. M. The materials employed by the Belgian nurserymen is not obtainable here;

Testimonials.
"Shirburn Castle, January 5, 1890.
"Sir, As you requested my opinion of the houses which you erected for me some 1 1/2 years ago, I beg to inform you that I consider them a perfect success, and I have recommended them to many of my neighbours.—Yours truly (signed) MACLEOD STELLER."
"Hornby Castle, Lancaster, February, 1890.
"Major FOSTER has much pleasure in stating that the various and forcing houses which were erected by Mr. Helliwell in 1884, continue to give perfect satisfaction, both to himself and his gardener."
"Estate Office, Ripley, Yorkshire, January 23, 1890.
"Sir HENRY INGHILL has much pleasure in stating that the glazing work executed by you, under your patented system, at the Ripley Castle Gardens, has been in every respect entirely satisfactory. The work has stood its years' wear and tear extremely well, and his hitherto cost nothing to keep it in repair."
HELLIWELL, 9, Victoria Street, Westminster.

ESTATE SALES.
The Best County Medium for Advertising Sales of Estates is THE "WORCESTER HERALD," ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other Property advertised in the Columns of the "HERALD."

Sales of Stock and Agricultural Effects.
The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.
Land Agents, Estate Managers, and all having Farms to Let would do well to advertise in the "WORCESTER HERALD," the Leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.
For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

Apply for terms. Price 2d. Published Friday for Saturday.

TO FLORISTS.—A young Lady seeks a re-engagement in the above. West End experience. Good references.—P. E. K. 55, Abingdon Villas, Earl's Court, W.

HOLLOWAY'S OINTMENT and PILLS.—A frequent cause of gout and rheumatism is the inflammatory state of the blood, attended with bad digestion and general debility. A few doses of the Pills taken in time are an efficient preventive against gout and rheumatism. Anyone who has an attack of either should use Holloway's Ointment also, the powerful action of which, combined with the operation of the Pills, most infallibly effect a cure. These Pills act directly on the blood, which they purify and improve. Having once subdued the severity of these diseases, perseverance with the Ointment, after fomenting the affected joints with warm brine, will speedily relax all stiffness, and prevent any permanent contraction.

Send for ILLUSTRATED LIST of

JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,

For Raising Water for the Supply of Towns, Villages, Irrigation, Railway Stations, Mansions, Fountains, Farms, &c.

No Cost for Motive Power, which is obtained from the Stream of Water passing through the Ram.

NO OILING OR PACKING REQUIRED.

MADE IN SIZES TO RAISE FROM 300 TO 200,000 GALLONS PER DAY. WILL FORCE TO A HEIGHT OF 1500 FEET.
SPECIAL RAMS for HIGH FALLS to send up to Two Gallons out of every Five Gallons passing through them.

Fig. A.

This Ram raises a portion of the same water that works it.

This View represents Fig. A Ram forcing up a part of the same water that works it, which is supplied from a spring. Special Rams of A make can be supplied to force to a height of 800 feet.

Fig. B.

This Ram, whilst worked by a stream of impure water, will pump clean water from a well or spring.

TESTIMONIALS.

From Mr. THOMAS VARLEY, Agent to the Trustees of the late William Ronnell, Esq., Gladstone Estate, West Marton, Skipton, August 11, 1887.

"DEAR SIR.—The Patent Hydraulic Ram you fixed five years ago on this estate is still working as well as it did on the day it started. It is driven by spring water carried along the hillside in 950 yards of iron pipe, and forces up an abundant supply to an underground tank on the hill at a distance of two miles from, and at an elevation of 280 feet above the Ram. The water is then gravitated through several pipes and branches, having a total length of about four miles, for the supply of the mansion, gardens, stables, estate workshop, and steam boiler, the village of West Marton, and several farms. There are five fire-plugs inside the mansion, and seven outside; and as the underground reservoir is 70 feet above the mansion, seven jets of water can be thrown over the house in case of fire. As there is still a considerable overflow from the underground reservoir running to waste, I intend to form a second reservoir at a lower level, and utilize the water for other farms. I have much pleasure in being able to report as above."

From C. PAGE WOOD, Esq., Wakes Hall, Wakes Colne, Essex, January 11, 1889.

"SIR.—In reply to your inquiry, the Hydraulic Ram you put down for me in 1884 has cost me only sixpence in repairs (for a new stud my blacksmith made); the second Ram you put down to supply an off-hand farm, has been running three years, and has cost not a penny for repairs; the third and largest Ram you put down two months ago, which is for the supply of water to my neighbours, is running satisfactorily. All three Rams throw up more water than you guaranteed. From inquiries I have made from friends who have Rams of other makers, I am convinced of the superiority of yours, and my third order is a proof of my good opinion. My abundant water supply is the greatest possible comfort to me."

"C. PAGE WOOD."

From MATTHIAS SMITH, Esq., Hill Top Hall, Pannal, near Leeds, January 14, 1889.

"DEAR SIR.—I have great pleasure in bearing testimony to the marvellous efficiency of the Ram you fixed here in January, 1888. It is worked by spring water of irregular volume, the dry-weather flow being 6 pints per minute, with which quantity you promised to work the Ram, forcing through 300 yards of delivery pipe to an elevation of fully 114 feet, but out of 5½ pints per minute, 160 gallons per day are sent up; and out of 2 gallons per minute now flowing through the Ram, 540 gallons per day are delivered at the same height. Considering the extremely small quantity of driving water, I certainly did not expect so grand a result. With every wish that you may get the reward you deserve,—I am, dear Sir, yours faithfully,

"MATTHIAS SMITH."

From Mr. HENRY ROBINSON, Engineer to the Stockport District Waterworks Company, September 8, 1883.

"DEAR SIR.—I can now report well of the two Hydraulic Rams we have fixed to your instructions for the supply of Disley Village. 40,000 gallons per day was the quantity you promised they would force to a height of 85 feet, but on testing them I am convinced that 50,000 gallons is not the limit of their power, whilst the quantity of waste water used in driving them is not equal to half the capacity of the 6-inch pipe by which they are fed, and I am inclined to the belief that a more simple and efficient pump cannot be found."

From J. A. RUTHERFORD, Agent to C. F. H. Bolekow, Esq., Estate Office, Marton Hall, Middlesbrough, September 26, 1883.

"DEAR SIR.—I am glad to say that the Rams you put down on the Hambleton Estate for Mr. C. F. H. Bolekow are working very well. You undertook, with 16 gallons per minute, to send up 1500 gallons a day, and with enough water to work the Rams at full power, 2000 gallons a day. With a supply of 1½ gallons per minute they are lifting 2200 gallons, and when working full power 3100 gallons per day are sent up to a height of nearly 400 feet. They made a clear start, and have gone well since." (The delivery pipe in the above case is 900 feet in length.)

From CAPTAIN TOWNSEND, Wincham, February 10, 1877.

"In answer to your inquiry I am glad to say the Hydraulic Ram you sent me in November, 1875, is working exceedingly well, and gives no trouble. It will work when quite immersed, as it has been several times during the floods this winter, forcing up water through a delivery pipe 900 yards long, at the rate of 80,000 gallons per day, although you only promised 50,000."

JOHN BLAKE, HYDRAULIC ENGINEER, ACCRINGTON, LANCASHIRE.

BRADBURY, AGNEW, & CO., Lombard Street, Precinct of Whitefriars, City of London, in the County of Middlesex, and published by the said WILLIAM RICHARDS, at the Office, 41, Wellington Street, Parish of St. Paul's, Covent Garden, in the said County.—SATURDAY, April 12, 1890. Agent for Manchester—JOHN HEYWOOD.

SALES BY AUCTION.

Thursday Next, April 24.

VALUABLE IMPORTED and ESTABLISHED ORCHIDS. MR. J. C. STEVENS will SELL, by AUCTION at the Great Rooms, 67, King Street, Covent Garden, W.C., on THURSDAY NEXT, April 24, at half-past 12 o'clock precisely, by order of Mr. F. Sander, St. Albans, CATTLEYA TRIANA, a splendid importation. The plants are in grand order, with fresh green leaves and plump eyes; there are many fine masses among them, with 100 bulbs and upwards. The plants now offered are the result of a special journey made by our collector to the district from whence we imported, some years back, the several consignments that produced the marvellous and hitherto unsurpassed varieties, so well known to Orchid lovers, Cattleya Triana-Leana, C. T. Schroderiana, C. T. Emporer, C. T. Meusuresiana, C. T. Courtlandiana, and many of others, whose names are too long to offer; we are sanguine that our expectations with regard to the lot now offered will not be disappointed, and that many extremely beautiful and distinct forms will be found to exist amongst them. It is well known that there are many forms of Triana greatly differing in shape, size, and colour, the finest varieties always coming from the district whence these came, but owing to its impracticable roads and enormous outlay, and the attendance, it is rarely that plants from this particular region are introduced.

CATTLEYA SPECIES.—We prefer designating the above as species, from the fact of the consignments having become mixed. Our collector writes as follows: "Cattleya with a very large lip, like Sanderiana;" "Cattleya with three colours, pink, maroon, crimson and yellow;" "Cattleya colour of Skinner, large, with yellow throat;" "These plants have been mixed in packages." Our collector was lying dangerously ill from the continuous hard work in the mountains and forests (far beyond the track of any white explorer), that has nearly cost the life of one of our best collectors. We were then there.

At the same time there will be offered fine Established Plants of the following:—

- Odontoglossum crotosium
- Orchis thalictroides grandiflorus
- Sophronitis grandiflora
- Cyclopogon Wayana
- Cervantesia
- Cyclopogon calosium
- Oncidium Papilio

And many other species of value. On view morning of Sale, and Catalogues had.

Thursday, May 1.

SPECIAL SALE OF ORCHIDS IN FLOWER. MR. J. C. STEVENS begs to announce that he will hold a SPECIAL SALE OF ORCHIDS IN FLOWER and BUD, on THURSDAY, May 1, and will be glad if Gentlemen desirous of ENTERING BIDS FOR THIS SALE will send their names and OFFERS AS USUAL, but at latest, by THURSDAY NEXT, as several Entries are already in hand. Auction Rooms and Offices, No. 5, King Street, Covent Garden.

Tuesday Next.

ESTABLISHED and IMPORTED ORCHIDS. A large quantity of the most beautiful and ESTABLISHED ORCHIDS, by order of Messrs. J. W. Steel & Co., of Chingwell, who are giving up their business, including a large variety of plants particularly suitable to gentlemen forming collections, and also about 120 lots of well ESTABLISHED, and SEMI-ESTABLISHED ORCHIDS; ORCHIDS from Mr. W. Gordon, of Two-busham, and an importation just to hand of the beautiful Cattleya Triana-Leana, ORCHIDS in flower, &c.

MESSRS. PROTHEROE and MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on TUESDAY NEXT, April 22, at half-past 12 o'clock. On view morning of Sale, and Catalogues had.

Wednesday Next.

GREENHOUSE PLANTS and FERNS, a large quantity of the most beautiful and ESTABLISHED FERNS, including a large quantity of BULBS from the Cape, HARDY PERENNIALS, and several lengths of INDIAN RUBBER HOSE.

MESSRS. PROTHEROE and MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on WEDNESDAY NEXT, April 23, at half-past 12 o'clock precisely. On view morning of Sale, and Catalogues had.

Friday Next.

CATTLEYA ALBA CHRYSOTOXA. DENDROBIUM FOROSUM GIANTUM. MESSRS. PROTHEROE and MORRIS have the pleasure to announce that they will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY NEXT, April 25, a large Consignment of Imported ORCHIDS; also a large quantity of popular varieties, specially adapted for the Trade.

CATTLEYA ALBA CHRYSOTOXA.—Without doubt, this is the most lovely Cattleya in the section to which it belongs. It has also another great recommendation, by its being a free grower and not "sniffy" under cultivation, as its Central American congener. Our collector, who first discovered this plant, has, after months of search, sent us a few more plants, which he has grown under glass, and which being round and plump, and the leaves green and healthy.

It is impossible to exaggerate the beauty and excellence of this magnificent Cattleya, and we can recommend it to purchasers with the fullest confidence, knowing that among them there are splendid novelties. The sepals and petals are usually of a brilliant primrose-yellow, the lip velvety-crimson, distinctly veined with golden-yellow. As many as four of its lovely blossoms are sometimes produced from a single bud.

DENDROBIUM FOROSUM GIANTUM. There are many forms of this species. The one now offered is a colossal variety, requiring precisely the same treatment as the ordinary type; the plants are very robust, and the buds are being stout and healthy; the flowers measure from 3 to 5 inches across, and are of great substance; they are pure white, the lip having a broad blotch of rich yellow in the centre. The flowers last a long time in perfection, hence it is most useful

Continued on next column.

Continued from previous column. for exhibition purposes, and also for cutting. Also a fine lot of Odontoglossum luteo purpureum in fine condition; Cattleya Mendocino, and numerous other varieties; Cypripedium Curtisii, a most beautiful species; Dendrobium Dearei, a fine list of plants; D. Jamesianum in fine condition; Phalaenopsis Schilleriana, a few very fine specimens. Also a fine importation of ODONTOGLOSSUM ALBAE LEHMANNI, Robt. L. just to hand. This is a simply lovely form, extremely rare, and producing great branching spikes, the lip always is spotted with large spots of a crimson-chocolate colour, of which there are generally five.

Also about 100 lots of CHOICE ORCHIDS in Flower and Bud, from Messrs. F. Horsman & Co. On view morning of Sale, and Catalogues had.

Special Sale, Tuesday, April 29.

ORCHIDS IN FLOWER. MESSRS. PROTHEROE and MORRIS desire to announce that their NEXT SPECIAL SALE OF ORCHIDS IN FLOWER, will take place as above for which they will be GLAD TO RECEIVE NOTICE OF ENTRIES AS SOON AS POSSIBLE.

Eltham.—Expiration of Lease. CLEARANCE SALE OF GLASS ERECTIONS, HORSES, CARTS, GREENHOUSE PLANTS, by order of Mrs. MESSRS. Nicotine Soap.

AN Unrivalled INSECTICIDE for the use of Plant Cultivators, being an effectual ERADICATOR OF SCALE, THIRPS, GREEN FLY, MEALY BUG, and ALL PARASITES affecting PLANTS, WITHOUT INJURY TO FOLIAGE. It has now undergone a thorough test by some of the most practical men in Horticulture, and it is proved, beyond all doubt, that no Insecticide will bear comparison with it for its deadly effect on Insects, combined with perfect safety to the Plants themselves.

Some hundreds of Testimonials lately received from men of considerable experience throughout the Kingdom.

Sold in Jars, 1s. 6d. and 3s.; in Tins, 15s. 6d.; and in Drums, 2s. 1b., 25s.; 56 lb., 50s.; 112 lb., 95s.

Full directions for use upon each Package.

MESSINGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses, Illustrations of every description of Glasshouses, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Gerio Frames, also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. **Price 2s. post-free.**

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country, an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made and gentlemen waited on in any part of the country. Plans and Estimates free on application.

CUTBUSH'S MILL TRACK MUSHROOM SPAWN.—Too well known to require description. Price 6s. per bushel (1s. extra per bushel for package), or 6d. per cake; free by parcel post, 1s. None genuine unless in sealed packages and printed cultural directions enclosed, with our signature attached. W.M. CUTBUSH AND SON, Nurserymen and Seed Merchants, Highgate Nurseries, N.

DANIELS BROS., TOWN CLOSE NURSERIES, NORWICH,

BEG to offer the following from their splendid Collection of Choice Named **FLORIST'S FLOWERS**, &c., all guaranteed true to name, and sent Carriage Free at prices quoted:—

- Chrysanthemums.**—Strong rooted cuttings from s. d. our fine collection of Japanese and Incaered varieties ... per doz. 2 6
- .. Extra choice sorts ... per 100, 21s. 3 6
- .. Six superb new Japanese, including Mrs. Alpbach Hardy, 7s. 6d.
- Fuchsias.**—Single and Double-flowered. All the most beautiful sorts. Nice young plants from single pots ... 6 for 2s. 3 6
- .. Extra choice sorts ... 6 for 2s. 6d. 1 6
- .. Four superb new varieties, including Countess of Aberdeen, 8s. 6d.
- Pelargoniums.**—All autumn-struck, well rooted young plants from single pots:—
- .. Single flowered Zonal, from our magnificent collection, including the newest and most beautiful sorts ... 6 for 2s. 6d. 4 6
- .. Extra choice and new varieties ... 6 for 2s. 6d. 8 0
- .. Six superb new varieties of 1889 (Pearson's sort), 7s. 6d.
- .. Double-flowered Zonal. A splendid class of lightly improved varieties. Fine named sorts, our selection ... 6 for 2s. 6d. 4 6
- .. Extra choice varieties ... 6 for 2s. 6d. 6 0
- .. Six superb new varieties of 1889, 7s. 6d.
- .. Double-flowered Ivy-leaved. A magnificent class, splendid for pots, hanging baskets, vases, or for holding out. Fine varieties to name ... 6 for 2s. 6d. 4 6
- .. Extra choice sorts ... 6 for 2s. 6d. 6 0
- .. Three fine new varieties of 1889, 11s.

- Carnations and Picotees.**—Choice named varieties, our selection ... 6s. 6d. and 12
- Hardy Flowering Plants.**—A splendid assortment including such fine plants as Bellflower, Primrose, Anemone, Pinks, Foxgloves, &c. Best distributed plants from single pots ... per 100, 30s.; 25 for 8s. 4 6
- Begonias, Tuberous-rooted, Single.**—Immense flowers, and in the most beautiful variety, strong flowering dormant tubers ... per 100, 10s. 6 0
- .. Double-flowered, splendid varieties ... 9 0
- Gladiolus, Gandavensis hybrids.**—Choice named sorts, our selection, in splendid variety of showy sorts ... 4s. 6d. and 6 0
- .. Exhibition varieties, very fine ... 6s. and 12 0
- .. Broad-leaved, the true old showy scarlet variety ... per 100, 10s. 6d. 1 6

SAMUEL SHEPPERSON,

Florist and Seedsman,
PROSPECT HOUSE, BELPER, DERBYSHIRE.

Wags to inform the readers of this Paper that he is prepared to execute Orders for the following Plants, all of which are of the very finest strains that money can buy. They have all been grown on the Derbyshire Hills, and are hardy and strong. Catalogue free. Cash with order. Descriptive LIST, 4d., free to customers.

CHRYSANTHEMUMS.—Special culture, not a collection of old-fashioned sorts, but the cream only of the best English, French, American, and Japanese raises, including the very latest novelties. Good well-rooted plants, 12 for 2s., 25 for 3s. 6d., free. Also Seed, 1s. and 2s. 6d. per pkt. all new of 1888 and 1889, for 4s.

PANSIES.—A great Specialty. Five Silver Cups, and other Prizes. The cream only of the most noted raises, the latest new sorts, and the winners at all the great shows. Good plants, correctly named, Show or Fancy, 12 for 3s., 25 for 5s. 6d., free. Also Seed, 1s. and 2s. 6d. per pkt.

PHLOX, special culture, the cream only from Downie, Laird & Sons, Kelway, Ware, and other first-class growers. Six fine varieties for 2s., 12 for 3s., true to name. Strong stools, to bloom well.

CARNATIONS, PICOTEES, and CLOVES.—Strong layers, to bloom well, finest named varieties, 12 distinct colours for 1s., 25 for 7s. 6d. Also Seed, 1s. and 2s. 6d. per packet.

CANTERBURY BELLS.—Grand new colours and new forms; double and single, telescopes, cup and saucer, and other varieties, 12 plants, to bloom well, 1s. 6d.; 25, 2s. 6d. Also Seed, 6d. and 1s. per packet.

THE BEAUTIFUL PURE WHITE and PINK MALVA MOSCHATA, one of the best hardy border plants in cultivation. Strong 2-year old plants, 12 for 1s. 6d.; 25 for 3s. 6d.; also Seed, 6d. and 1s. per packet.

HOLLYHOCKS.—Warranted all fine double flowers. Claret's select strain. Strong year-old plants to bloom well, 12 varieties, 3s.; 25 varieties, 2s.

POLYANTHUS and PRIMROSE.—Hybrids, splendid mixed colours, finest strain grown, 12 for 1s. 6d.; 25 for 2s. 6d.; 100, 1s., all good blooming plants. Also Seed, 6d. and 1s. per packet.

HYACINTHUS CANDICANS.—A really fine and stately hardy white-flowered border plant. Six flowering bulbs for 1s. 6d., 12 for 2s. 6d.

DELPHINIUMS.—In all the colours found in this flower, regular and irregular plants. Strong plants to bloom well, 6 for 1s. 6d., 12 for 2s. 6d., free. Also Seed, 6d. and 1s. per packet.

FOXGLOVES.—Gloxinia flowered. Dean's grand new large spotted, and pure white varieties, 12 for 1s. 6d., 25, 2s. 6d. Also Seed, 6d. and 1s. per packet.

SWEETLY-SCENTED, PURE SNOW-WHITE PINKS, quite hardy, 12 for 1s. 6d., 24 for 2s. 6d.

CARNATIONS, PICOTEES, and CLOVES.—Strong year-old plants, from finest varieties only, including many new sorts; 12 beautiful varieties for 2s. 6d., 6 for 1s. 6d., 10s. 15s.

FANCY PANSIES.—Unnamed, 12 for 1s. 6d.; 25 for 3s.; 100 for 10s. All different and first-class sorts.

THE NEW DOUBLE SCARLET GEUM, A hardy free bloomer, strong two-year-old plants, 12 for 1s. 6d., 25 for 2s. 6d., 6d. and 1s. per packet.

AURICULA (Alpines). A splendid collection from strong plants to bloom well, most beautiful colours and sweetly scented, 12 for 3s.; 25s. for 5s. 6d. Seed, 6d. and 1s. per packet. Also **ARIZONELLA,** the real old Irish Lady Miller, sweetly scented, 3 for 1s. 6d.; 6 for 2s. 6d.

THREE WHITE GEMS, CAMPANULA PÆNICIFOLIA, Single White, Double White, and CORONATA, all quite hardy and unrivalled for cut flowers, 3 of each for 2s.

THREE WHITE HARDY BEAUTIES GNAPHALUM LANATI M., everlasting, last for years after being cut. **HEBES CORIIFOLIA,** evergreen, and pure white. **ARIZONELLA** All the largest pure white, 1 each for 1s. 6d., 2 each for 2s. 6d.

TOMATOS.—The best sorts in cultivation. See Chiswick Great Tomato Trial. 1s. 6d. per dozen.

TWO GEMS, PRIMULA CORTUSOIDES and PRIMULA CASHMIRIANA.—Gardening papers say it would be difficult to find more beautiful plants for the Rockery, Borders, or Greenhouse than these, 2 each, 1s. 6d.; 4 each, 2s. 6d. Also **Primula** Su. bold ovata, the Queen of Primulas, Geoghe's International Prize, 3 distinct varieties named for 2s.

12 HARDY PERENNIAL BORDER PLANTS (named), distinct and useful for decoration and cutting purposes, for 2s.

12 VARIETIES of SHOWY, Free-flowering, and other WINDOW PLANTS (named), for 2s.

NEW STRAWBERRY, NOBLE (Laxton's).—This is, without doubt, the earliest, hood-ripest, largest, and best Strawberry in cultivation; 12 fruiting plants for 1s. 6d., 25 for 3s. 6d., 100 for 7s. 6d.

STRAWBERRY PLANTS.—Selected Crowns for fruiting this year: British Queen, Pauline, Sabreur, Vocontesse, J. de Thury, Duke of Edinburgh, King of the Earths, Sir Harry, Dr. Hogg, President, The Captain, and other new and extra sorts, 2s. for 100.

VARIETIES OF VARIATION,
WITH SPECIAL REFERENCE TO
BRITISH FERNS.

THE causes which lie below the sudden and wide departures from the normal types which occur so frequently in the vegetable world, both under culture and under natural conditions, are such deeply hidden secrets of Nature, that so far no theory has ever been broached to account for the phenomena observed.

In many cases, amongst highly cultivated plants, which by a long course of selective propagation have lost all outward semblance of the original type, the sudden change of form is seen manifestly to be a case of reversion more or less complete to the normal. In these cases the change may be attributed, on the Darwinian hypothesis of Pangenesis, to the presence in the system of the plants of reproductive germs continuously transmitted through many generations from the normal wild ancestor, which germs or gemmules, under favourable circumstances, overpower the influence of the abnormal ones, and reproduce the more natural form whence they originally sprang. This phenomenon takes place the more frequently through the seed or spore, the resulting plant, though derived from a highly modified form, reverting entirely or partially to the original type. Less frequently this reversion takes place in the bud, the result being a branch or offset springing directly from an abnormal parent, and yet devoid of all the characters which long and careful selection through numerous generations had apparently permanently fixed in the parental constitution.

How this may be brought about can be easily imagined by adopting the Pangenesis hypothesis already alluded to, for though in each successive generation of an abnormal form, the proportion of normal gemmules or reproductive molecules, which is transmitted in the blood or sap of the offspring becomes reduced, their complete elimi-

nation is unlikely, hence a fortuitous collection of them at a given centre of growth, may determine a predominance sufficient for the production of the old form instead of the modified one.

The converse cases, however, in which very abnormal forms suddenly appear by bud, seed, or spore variation, to which we are indebted for most of the myriad forms of flower, fruit, and foliage plants which figure in our botanical collections, and to a far greater extent in our florists' catalogues of the present day, permit of no such explanation. In these cases, it may and does happen that a type which has been steadfast for ages, suddenly assumes, through its reproductive centre, a form differing very widely indeed from the normal type. Such forms, moreover, may be and often are endowed with the power of transmitting these newly-acquired peculiarities quite constantly to their offspring, so that a permanent type is produced with the new characteristics. In many cases the metamorphosis is so thorough, that reversion does not appear to occur at all. The abnormal new type, on the other hand, may be only partially modified, the result being not only more or less inconstancy, i.e., partial reversion, but also great diversity in the offspring, of which the majority may be entire reversions.

Much of the difficulty which attends the study of these phenomena, and the deduction of any consistent theory from the result of the observations made, is doubtless due, in the first place, to the enormous area of research; in the second, to the splitting up of that area by the fact that the distinctive features of each tribe of plants are only likely to be properly noted by specialists, who restrict themselves to a comparatively small field, and finally, by the want of some adequate generalising brain to collate the data, and draw the deductions they may justify.

Darwin himself has done this to an unparalleled extent in his *Animals and Plants under Domestication*, in which he brings together a vast host of facts derived from the animal and vegetable kingdoms, in both of which the phenomena of variation run on identical lines. The Fern specialist, however, cannot fail to be very strongly impressed by the necessarily incomplete record afforded by the work in question, when he finds that the very remarkable, and, in some respects, unique powers of variation possessed by the Fern family are summed up in a solitary short remark on the power of spores taken from abnormal fronds to reproduce the abnormal character. This is the more striking as the thousands of curious instances of sports and reversions which have occurred chiefly under natural conditions, i.e., in wild plants, render it probably a better representative than any other of the manifold phenomena of variation.

With a view, therefore, to the initiation of a record (supplementary, of course, to the data published in the works of the late Mr. T. Moore, Mr. E. J. Lowe, and others), I propose to give an account of the peculiar phenomena of constant and inconstant variation which have come under my own personal experience, trusting that other Fern lovers may add their records thereto, and thus by bringing the various experiences to a focus render palpable some clue to the origin of the peculiarities observed; just as our statisticians, by collecting a mass of apparently unconnected and inchoate figures, often find them arrange themselves into symmetrical groups and curves which reveal laws otherwise undreamt of.

To begin with one of my own finds, *Lastrea filix-mas* polydactyla, Drury. This plant forms one of the most striking instances of unexpected inconstancy and reversion. It was found in a roadside coppice, near Kilmarnock, in 1884, and when discovered was growing as a single crown in the midst of a dense mass of normal plants. The crown bore four or five fronds, each of full size, i.e., about a yard long, the tips of the fronds and extremities of all the pinne being expanded into broad flat tassels, formed of, in many cases, more than a score of slender

filaments. All the fronds were perfectly symmetrical, and the pinna being longer and slenderer than in the normal form, the weight of the tassels imparted a peculiarly graceful pendulousness. On bringing it home, it was pronounced by the late Col. A. M. Jones, one of our best judges, to be by far the finest polydactylos form found, the next best not being more than half so much divided. As the plant was profusely sporiferous, an immediate sowing was made, from the polydactylos tips only, in order that so charming a form might be perpetuated and distributed. In due course, this being one of the deciduous forms of the species, it died down. The following spring it rose vigorously, but was utterly unrecognisable, though perfectly healthy and robust, the fronds presented no sign whatever of creasing, and were mostly disfigured by a number of depauperate pinnae, the only abnormal feature distinguishable, save perhaps, a faint trace of slenderness in the pinnae. Practically, with these exceptions, it seemed a thorough case of reversion. In the autumn a single frond arose with a few pinnae slightly divided. Since that time, the large majority of the fronds have shown the depauperation only, the rest, with one exception, which was fairly divided throughout, bearing traces only of creasing here and there. From the spores, taken carefully, it will be noted, from the most abnormal portions, viz., the much divided tips, a plentiful crop of young plants resulted, these followed exactly the same course, one or two started very promisingly, showing creasing in all the early fronds; but one and all took eventually to reversion and depauperation exactly like the parents. At my suggestion a second search was made in the coppice, and a second precisely similar plant, with three crowns, was found, one of which was sent to me. This was obviously of identical origin as my own find, as it went through precisely the same course, viz., reversion, depauperation, and spasmodic attempts at reassertion of the tasselled character. One of these three crowns, however, which was retained in Scotland, sent up in 1889 a perfectly symmetrical set of fronds fully equal in all respects to the state it was in when found.

The instability of the abnormal character in this case is very extraordinary, when the perfect thoroughness, symmetry, and extreme development is considered. The depauperation of so many of the fronds, both in the finds themselves, and in the progeny of the first one, is also remarkable, for though it is entirely absent in this case, when the fronds are markedly polydactylos, we find it constantly correlated with another crested form of the same species (*L. f.-m.* Jervisii), a Staffordshire find, every frond of which is more or less depauperate on one side. Mr. Lowe also chronicles *L. p.* m. depauperata Monkmanni as a non-crested depauperate seedling from the cristata form, which is very constant and symmetrical. Another crested form (*Lowia*) is also recorded by the same authority as constantly partially depauperate. It is difficult to account for this correlation, as the abnormalities seem essentially opposed in character, one being a deficiency and the other a redundancy. Nor is this apparently a matter as at first sight it might seem to be, of robbing Peter to pay Paul, as there is no extra development of the pinnae on the opposite side of the frond to the depauperate portions, the occurrence of which seems quite fortuitous. *T. Drury, F.L.S., Fernholme, Forest Gate, Essex.*

(To be continued.)

THE HANBURY INSTITUTE.—Mr. THOMAS HANBURY, of the riches of whose garden at La Mortola we have so often had occasion to speak, has founded, in connection with the University of Genoa, a botanical laboratory and museum, which will be placed under the direction of Professor PENZIG. The botanical institute will be open to all properly accredited students, whether connected with the University or not. It is expected that the buildings will be finished so as to be utilised for the Botanical Congress, to be held at Genoa in 1892, in connection with a Geographical Congress and the Columbus festival.

NEW OR NOTEWORTHY PLANTS.

ERANTHEMUM TUBERCULATUM, Hook.

THERE are many plants cultivated in gardens that have never been referred to a botanist for identification, and have received names without having been described at all, or with a very imperfect description from a botanical point of view, and it is always desirable that these should be identified with known species when possible. One of these botanically little-known plants was sent to Kew recently by Mr. Lynch, the Curator of the Cambridge Botanic Garden, under the name of *Eranthemum eboracense*, which, on comparing with the Kew Herbarium specimens, I find to be *Eranthemum tuberculatum*, Hook., described and figured in the *Botanical Magazine*, t. 5405, and the *Floral Magazine* for 1864, vol. iii., pl. 182. On looking for a reference for the garden name *E. eboracense*, I find it was sent out under this name by Mr. Bull in 1881, who gives a brief description of it on p. 18 of his catalogue for that year. Mr. Bull introduced it from Duke of York's Island, but it is also a native of New Caledonia, Isle of Pines, and the adjoining Loyalty Islands, and in all probability several other of the South Sea Islands. It is a pretty little shrub, with woody stems covered with small tubercles, from which it receives its name. The leaves are exceedingly variable in size, even in the same specimen, ranging from one-third of an inch to 2 inches in length; they are elliptic, elliptic-oblong, or oblong, slightly sinuate on the margin, obtuse at the apex, and narrowed into the petiole at the base. The flowers are freely produced; they are about an inch in diameter, with a tube of the same length, and are pure white. *N. E. Brown.*

LISIANTHUS.

THE plant figured as *Prepusa Hookeriana*, p. 421 [and which we may here say was flowered at Kew], with the remark that "many of these Genians, such as *Lisianthus*, are difficult to cultivate," suggest remarks on their cultivation. It may be taken for granted that many plants of supposed difficult management are easily enough grown, when their cultural requirements have been discovered. The *Prepusa* referred to was discovered in the first place by Mr. Gardner, and the figure in the *Botanical Magazine* was from a drawing made of native specimens, no clue being given as to how the plants sent over in a living state throve under cultivation. Gardner says he found it on the "summit of the Orgau Mountains, at an elevation of 6,857 feet above the level of the sea, growing in large patches in most exposed places, and flowering in March and April." Here, in a few words, is a valuable clue to the system of cultivation best adapted for this particular plant. It may not be that a too close imitation of the natural conditions under which a plant is found growing is the best, or one that it is possible to follow; but it is well that we should know what they are.

The *Asplenium marianum* grows freely, exposed to every wind that blows on the rugged rocks overhanging the sea; but if by careful management we may chisel some of them out alive, and transfer them to our gardens, they succeed there best in a warm vinery, under the Vines—conditions the very opposite of the natural ones. In the year 1835, Mr. Drummond sent home some seeds from San Felipe d'Austin, Texas, with the remark that the plants from which they were gathered were not excelled in beauty by any. The seeds were sown, and the plants flowered in 1837, first under the care of Mr. Turnbull, at Bothwell Castle, and then in the Glasgow Botanic Garden, by Sir W. J. Hooker, K.H. The plant was *Lisianthus Russellianus*, named in honour of the Duke of Bedford of that time, a liberal patron of gardening. The figure in the *Botanical Magazine*, t. 3626, from Mr. Turnbull's plant, shows a remarkably well-grown spray.

Now here is a plant supposed to be difficult of

cultivation, whereas it is easily grown if it gets proper attention, and when well grown is worthy of intense admiration. If good seeds can be procured, that is the chief thing; plants could not

They are very small, and much like those of *Calceolaria*. The mode of culture to ensure certain success is this:—The seeds are sown in a pot or pan of fine sandy peat, which has previously been

in an intermediate-house. If the soil should become dry before the plants appear, it must be wetted by plunging the pot or pan in water for half a minute, or long enough to wet the mould, but not to saturate it; for if the mould be made too wet, the seeds may perish.

When the plants appear they will want careful attention, and if water is required, it should be applied as before. When ready to prick off, place three plants round the sides of small pots; they do not grow very rapidly, but they would require to be shifted into 4 or 5-inch pots by September, and would pass through the winter in these pots on a shelf near the glass in a warm house; but the plants have an awkward habit of dying off during the winter, and to reduce the losses, I would still advise dipping the plants instead of watering them in the usual way. [To avoid the necessity for frequent waterings during winter, it has been found to be an advantage to plunge the pots containing them in other and bigger pots, filling in the intervening space with sand, fine coalashes, or sandy peat. When growing, the plants may stand in saucers in which is a little water, taking care that the pot is full of roots first. Ed.]

When the plants begin to grow early in the spring, let them be repotted into 8 and 9-inch pots, and in these they will produce their flowers about July and August. I wintered a fine lot of plants some ten or fifteen years ago in a Cucumber-house, where the temperature was seldom below 65°, and they grew into very fine flowering specimens. The plants should also be shaded when they flag in bright sunshine early in the year. I have had single pots of these plants with a hundred flowers upon them; these are of a lilac-purple colour, and resemble those of a small Tulip.

Sixteen years ago, I wrote an article on the culture of this plant for the *Florist and Pomologist*, which brought out another in the next number from that good gardener, Mr. James Barnes of Exmouth, wherein he quite agreed with the above method of culture, and described how well an amateur of small means grew them at Exmouth, he having only a small greenhouse and a two-light pit. This amateur, by name Webber, used 10 and 12-inch pots in which to grow his plants, and a compost of well-decomposed cow-dung, leaf-mould, heath soil or light turfy loam, and plenty of sharp sand to keep the compost open. One point in their culture I noted, that in winter the pots containing the plants were placed in saucers, the reason being that they were never watered on the surface of the soil, "but tepid water is always applied to the saucers." If the surface of the soil, late in autumn and through the winter, is watered, the plants are very liable to shrink off or canker at the surface, and that, too, very suddenly.

When the old plants have flowered, they may be thrown away, unless it is intended to save seeds from them. They are produced freely in a greenhouse. *L. princeps* is a very desirable plant if we could obtain living plants, and flower them. Dr. Lindley first described this beautiful plant in vol. iv. of the *Journal of the Royal Horticultural Society*, September 12, 1849. But he had not seen a living plant. M. Linden, of the Luxembourg nursery, had raised it from seed, but it had not flowered with him at that time; but it was figured later in the *Flore des Serres*. Dr. Lindley described it as a plant of great beauty, the corolla being 5 inches long, and 1 inch wide in the widest part; the cup of the calyx is half an inch deep, and we now know the corolla is yellow and crimson. It is a native of New Grenada. I remember being present at a sale in Stevens' Rooms some eighteen years ago when a packet of seeds, sent home by some collector, was sold for about £17, Mr. B. S. Williams being the purchaser. Whether any of the seeds vegetated, I do not know; but I have not heard of, nor ever saw, a flowering plant of it. Collectors ought to look out for this fine plant.

In the same year that Dr. Lindley published his account of *L. princeps*, another rather pretty species, *L. pulcher*, was figured in *Bot. Mag.*, t. 4421. This

(SEE P. 493)

easily be obtained in the trade, and even if they could, I advise the purchase of a packet for about a shilling. The seeds are not always good, as not being much in request, they may not always be new.

watered and allowed to drain, and is sprinkled over lightly with silver-sand. A piece of glass is placed on the pot, which is shaded from the sun. The sowing may take place in May or June, and I find a good place for the seed-pots is a shelf near the glass

species is also of New Grenada, and was detected by Mr. Purdie on the Monte del Moro in October, 1845. It forms a tall shrub, 5 to 7 feet high, and the spikes of flowers are much like a scarlet Pentstemon, with the flowers having a white throat. It grows, Mr. Purdie says, at an elevation of 7000 to 8000 feet, on shelly limestone rocks, which are merely covered with a thin stratum of dry peaty soil. It would be a great boon to many of these two last-named beautiful plants could be freely cultivated; it is not much use writing about them, except to ascertain where and how they are grown. *J. Douglas.*

A HISTORY OF ENGLISH GARDENING.

(Continued from p. 418.)

ELIZABETHAN GARDENING.

On either side of the "open" paths of the garden, were often ranged at various distances from one another, columns of stone,* "greate Tarkie Jarres," pyramids of wood, or of other material, or "large Carnation pots." The latter, Sir Hugh Platt tells us, were generally pierced "with ranks of sloping holes of the bigness of a man's finger, each rank one inch distant from another," then planted with "Carnations or Lilies," and in every hole was set a plant of Hyssop or Thyme, which was "kept even by much clipping." These Carnation pots, we gather from the same old author, were set upon "fair pillars" in the garden.† "Also," writes Platt, continuing, "you may make either of stone or of wood, pyramids, losinges, circles, pentagons, or any forme of beaste or fowle, in wood, or burnt clay full of slope holes (as before in Gillefower pots); these being planted with herbes, will very speedily grow greene according to the forme they are planted in. And in this manner, in two years space you may make a high pyramid of thyme or rosemary."‡

The knots, as we have mentioned in a previous article, consisted of flower-beds (sometimes merely marked off by a border from the same level as the adjoining ground, sometimes raised about a foot above the level of the gravel walks §), edged, as Parkinson observes, with "living herbs or dead materials." "Of herbs," writes Parkinson, "there are many sorts wherewith the knots and beds in a garden are used to be set."

Dwarf Box, which appears to have been introduced into this country by the French gardeners, was the material most commonly used, though Thirist, we are told, was the "most aunciently received." Gerarde, writing in 1597, remarks that the latter plant was much used for "the bordering up of beds and banks for which it serveth very fitly." It also had a "tendencia to growe thicke and bushie," and "in summer tyme sent forth many short stalks of pleasant flowers which serveth to deck up a house among other sweet herbs." Germander, Hyssop, Marjoram, Savory, and Thyme, "in like manner being sweet herbs," were also used "to border up the beds and knots."¶ Lavender cotton, being "a raretie and a noveltie," was only used in the gardens of "great persons."** Slips of Juniper and Yew were also "received of some, and planted because they are always greene." The "dead materials which Parkinson speaks of were," as he says, "verie divers," and consisted of leads, tiles, bones, "round whitish or big pebble stones of some reasonable proportion and bignesse, and such-like things."

The pattern of the knots was strictly geometric, stiff and formal, like the patterns of Arabic tracery, but wital very well adapted for filling in with har-

monious colouring. Sometimes the knots were filled with divers coloured earths, but as Bacon remarks, "they be but toys; you may see as good sights many times in tartes." More generally, however, they were thickly planted with flowers. Parkinson mentions an arrangement of spring flowers which, "all planted in some proportion, as neare one unto another as is fit for them will give such a grace to the garden, that the place will seem like a piece of tapestry of many glorious colours, to increase every one's delight." He also tells us that "Tulips may be so matched, one colour answering and setting off another, that the place where they stand may resemble a piece of curious needlework or piece of painting." These kinds of flowers which "being strangers unto us, and giving the beauty and bravery of their colours so early, before many of our owne bred flowers, the most to entice us to their delight," were the most generally chosen by the Elizabethan gardeners for filling in the knots. It was one of the chief aims of the gardener to produce a rich effect of colour, and therefore he planted such flowers as Daffodils, Fritillarias, Hyacinths, Saffron flowers, Lilies, Tulips, Anemones, and a "number of such other flowers, very beautiful, delightful, and pleasant, wherof although many have little scent to commend them, yet their earliness and exceeding great beautie and variety doth so far countervail that defect, that they are almost in all places with all persons, especially with the better sort of the gentry of the land, as greatly desired and accepted as any other the most choicest, and the rather, for that the most part of these outlandish flowers doe show forth their beauty and colours so early in the year, that they seem to make a garden of delight even in the winter time, and doe so give their flowers one after another, that all their bravery is not spent until Gilliflowers, the pride of English gardens, do show themselves.**

Of Daffodils there were almost a hundred sorts—"every one to be distinguished from the other," and many of them bore flowers "so exceeding sweete, that a very few" were "sufficient to perfume a whole chamber." Of Fritillarias or "Chequered Daffodils," there were some "half a score, several sorts, both white and red, both yellow and blacke, which," says Parkinson, "are a wonderfull grace and ornament to a garden in regard of the chequer-like spots that are in the flowers." Of Hyacinths there were nearly fifty sorts, "some like unto little bells or stars, others like little bottles or pearles, both white and blew, sky-coloured and bluish, and some starlike of many pretty various formes, and all to give delight to them that will be curious to observe them." Of Crocuses there were only about twenty sorts known to the Elizabethan gardeners. One of these, the "Medowe Saffron," was called "the sonne before the father," but, as Parkinson observes, "not properly." "Then have wee," writes the same old author elsewhere, "twenty several kinds of Lillies," among which he reckons the Crown Imperial "that for his statley forme deserveth some special place in the garden." This latter plant was a great favourite with the Elizabethans, and is often mentioned in the poetry of the period. Shakespeare, it will be remembered, mentions it in *Winter's Tale*, act iv, scene i.† Many varieties of Martagon Lilies were grown, "both white and red, both bluish and yellow," and they were generally set by "themselves apart as it were, in a small round or square of a knot without many other, or tall flowers, growing neare them." The number of sorts of Tulips grown by the Elizabethan gardeners were "so many as to be almost infinite." They were, too, of "such wonderfull variety and mixture of colours," that it was "almost impossible for the wit of man to decipher them thoroughly." The Tulip was introduced into this country probably about the year 1577; and less

than fifty years afterwards we read that there was not "one lady or gentlewoman of any worth," in the whole realm, "that was not caught with the delight of cultivating these flowers, or not delighted with them." Anemones or Windflowers were also planted out in the knots because they were "so full of variety and so dainty, so pleasant and so delightful flowers, that the sight of them doth enforce an earnest longing desire in the miunde of anyone to be a possessor of some of them at the least." Another flower grown in the borders was the "Beare's ear," or Auricula, and of it were many varieties of "many differing colours, not unfurnished with a pretty sweet scent which doth add an increase of pleasure to those that make them an ornament for their wearing." Of Irises there were many sorts, and they were much esteemed. "The Greater Flaggie," says Parkinson, "well doth serve to decke up a garden and house." "But," he continues, "the chief of all is your sable flower, so fit for a mourning habit, that I thinke in the whole compasse of Nature's store, there is not a more patheticall, or of greater correspondency, nor yet among all the flowers that I know any one coming neare unto the colour of it." The Hepatica was "another flower of account, wherof some are white, others red or blue or purple." The Elizabethan gardeners also cultivated in their knots a number of varieties of Ranunculi and French Marigolds, which made a glorious show for colour.

The "side-beds" of the Elizabethan Gardens—the beds which were laid out immediately inside the garden walls, were generally reserved for the cultivation of what Parkinson calls "English" flowers. Among these may be noted: Primroses and Cowslips, "wherof there be many varieties."** Wallflowers, "very delightful to be set under a parlour or chamber window."† Sweet Williams, grown as Gerarde remarks, "more to please the eie than either the nose or the bellie."‡ Snapdragons and Columbines, "single and double, of many sorts, fashions, and colours, very variable, both speckled and party-coloured;" "flowers of that respect that no garden would willingly be without them that could tell how to have them." Pansies or Heartsease, "of divers colours; and, although without scent, yet not without some repute and delight." Double Poppies, "of a great and goodly proportion, adorning a garden with their variable colours, to the delight of the beholders." Stocks, "almost as common as Wallflowers, especially the single kinds, in every woman's garden." Double Daisies, "white, red bluish, speckled, and party-coloured." Double Marigolds, Canterbury Bells, Paeonies, double and single; and Carnations and Gillyflowers, "whose bravery, and variety, and sweet smell, joyned together, tyeth everyone's affection with great earnestness, both to like and to have them." Besides these old-fashioned plants, Sunflowers, Hollyhocks, and a few other large-growing ones, not suitable for planting in the knots, were cultivated in the "side-beds." *P. E. X.*

(To be continued.)

NURSERY NOTES.

CINERARIAS AT FARNHAM ROYAL.

On April 29, 1879, eleven years ago, there was issued with the *Gardeners' Chronicle* a coloured illustration of three of the red-hued varieties of Mr. James's then popular strain of Cinerarias. The production of this plate on the occasion of a recent visit served most admirably to mark time in the onward advance made by Cinerarias when compared with the wonderful flowers of to-day. Taking the plate referred to as evidence of the life size of the blooms at the date named, it is certain that during the past decade Cineraria flowers have practically doubled in average size, and have as greatly advanced in breadth and stoutness of petal. At the recent visit referred to, there was special interest attached to the

* Hentzer, writing in 1595, tells us of columns and pyramids of wood and other materials "up and down the garden," at Theobalds.

presence of one visitor who had been a grower of Cinerarias for market largely some 30 to 35 years ago, and in whose day Weatherill's strain occupied the place of pride. With the recollection of these flowers of old days still strongly lingering in his mind, and full of belief that it was the best strain ever seen, the old grower confessed that he was astounded at what he saw of the Cinerarias at Farnham Royal. If the illustration of but eleven years ago shows by comparison how great is the advance made in that short interval, it is not at all difficult to realise what has been the advance made in some three times that length of time. But it is not only in size and quality of bloom that advance has been made. There is a remarkable advance in habit evident. A tall leggy plant is never seen at Farnham Royal, although some 2,500 are just now blooming there, yet the front row ranks start at 10 inches, and they rise gradually up to a height of 14 inches, but nothing taller. Thus we find an average of about 12 inches as the natural height of the present good strain of Cinerarias, and those which are taller and leggy in habit should be discarded.

If there be no great variation in colours beyond what were seen in the old days, there is much greater body and more defined markings. It is difficult to define the most pleasing, as the selfs are so rich, whilst the ringed flowers are so lively. There has been a very marked advance in the pure self, indeed these stand out as a specially valuable section, because of the ever-increasing demand for white flowers. Mr. James mentions that the white selfs invariably come very true to colour from seed. Taking the selfs as found in one long house, they start with big blotches of whites, then rich cobalt blues, purples, rosy-reds, and deep reds and crimson. Whilst the whites are pretty much alike, there is divergence of shade and tint in the other sections, but for seed-saving purposes some half dozen of colours suffices. In a second house are blocked in a similar way the edged or ringed flowers. Of these come first the blues in diverse tints, all wondrously beautiful and effective. Then follow the purple and purplish-red tints, some of the blooms being of inordinate size. The most brilliant section, however, is found in the deep red and crimson-lined edged flowers; these make glorious banks of colour, and, seen in the subdued sunlight, are beautiful indeed. Finally come the light reds and carmine-edged flowers—a very pleasing selection. Some flowers of the best possible form measure from 3 inches to 3½ inches, but the average size is about 2½ inches. The entire show will be in the finest form about the middle of April, and a month later the splendid collection of Calceolarias will be a brilliant show also. A large number of plants in 10-inch pots we may hope to see in London when in full bloom. They are just now the very picture of health. A.

ORCHID NOTES AND GLEANINGS.

BRIDGEN PLACE, BENLEY.

WORTHY of ranking among the leading collections in the neighbourhood of London stands that of Mrs. Arbuthnot. The garden, a fine one, has been laid out with taste and discrimination by her son, F. G. Arbuthnot, Esq., and an excellent selection of Orchids made, which, thanks to the good accommodation provided for them, and the skill of Mr. Mitchell, the gardener, have attained to great vigour and floriferousness.

In every collection there is a leading feature—a something which strikes the visitor more forcibly than anything else; and this feature at Bridgen Place comprises the Cattleyas and the Odontoglossums. At present the latter give the better show, and it is not often that one sees a display more satisfactory than that which is found in the commodious Odontoglossum-house at the present time. There are scores of fine spikes of *O. crispum* and *O. Pescatorei* of a very fine strain, all being large-flowered, some prettily spotted, and shaded with

crimson and rose, and one is of a very great size and unusual form, the labellum being elongated so as to approach the petals in length. Another exceptionally fine strain is that of the *O. Rossii majus*, which at Bridgen Place appears in much variety. Let us select the three best. First should come *O. Rossii rubescens*, a plant with several spikes and flowers, the latter suffused with bright rosy-lilac; then comes a variety with flowers of fine size and substance, the petals and labellum wax-like, and of a clear French white; and the third with an unique crimped labellum, much longer than usual, the callus at the base of the lip bright yellow, and the rest of its surface, and the petals, beautifully veined with pink. In addition to the reddish blotches usually seen on the lower half of the petals, the variety in question has several other large blotches irregularly scattered over the outer half of the petals. These are three charming forms of *O. Rossii majus*. In the same house, in bloom, were some fine plants of *O. triumphans*, a noble form of *O. Harryanum*, *O. luteo-purpureum*, *O. Andersonianum*, *O. Wickenum*, *O. odoratum gloriosum*, the beautiful *Oncidium lamelligerum*, *Masdevallias*, and other showy things.

About the staging of this house: it will be well to remark that the close staging for giving off moisture is covered with small coal, the upper open staging being a wood frame covered with half-inch galvanised wire-netting for the plants to stand on, the legs of the upper staging standing in pans of water on the close staging, in order to keep creeping insects of all kinds from having access to the plants. Rain-water is used, and a system of free ventilation believed in and acted upon.

In the other two divisions of the new range of cool-house area, in the first division, magnificent *Miltonia vexillaria* and *Cypripedium hirsutissimum*, *C. villosum aureum*, *C. Boxalli*, *C. callosum*, and others, in bloom. In the second division is a splendid piece of *Maxillaria Sanberiana* with three of its noble white and crimson flowers; a beautiful form of *Miltonia cuneata*, whose flower segments are yellow or buff at the tips; a pretty *Calogyne breviscapa* with many flower-spikes; *Odontoglossum hastilabium*; some fine species of *O. cordatum*; *Epidendrum prismatocarpum*, and here, as in some of the other houses, are some grandly flowering plants of *Oncidium sarcochloa*.

In the Cattleya-houses are some fine forms of *C. Trianae* in bloom, also *C. Schroderae*, the very handsome *C. labiata speciosissima*, and, well set with sheaths, some good specimens of *C. labiata Warneri*, *C. Mendelii*, and all the other showy Cattleyas and Laelias. In this range, too, is to be seen a fine display of varieties of *Lycaste Skinneri*; a charming variety of the crimson *Broughtonia sanguinea*; a grandly flowered specimen of *Oncidium Marshallianum* with a seven-branched spike; two specimens of *Adiantum nanantiaea*, each with eight spikes; *Cymbidium charybdeum*, and some *Odontoglossums*.

In the East Indian house were *Phalenopsis* of all the leading species—large, well-flowered plants, some sprays of *P. grandiflora* and *P. Luddeமானiana* superba being especially good. Here, too, in bloom, are *Angraecum citratum* and *Miltonia phalenopsis*, the last-named growing very vigorously, and sending up spikes in profusion, in a corner allotted to it, just within the doorway.

In the stoves and general plant-houses—of which there are many, and all in fine order—were specimen *Anthuriums*, now well furnished with spathes, and other stove foliage plants with these being the *Dendrobies*, among which were *D. fimbriatum*, *D. f. oculatum*, *D. nobile*, *D. Devonianum*, the rare *D. chlorolabium*, with twenty to thirty of its yellowish-white flowers on each spike, and others now in bloom. *J. O.E.*

THE KILNS, FAIRBairn.

The name of John Gair, Esq., is familiar to all Orchid growers in Scotland. I had looked forward with pleasant anticipation for some time to a visit I was to pay to The Kilns. The collection has been

recently thinned of some of the duplicate and surplus plants, which have been disposed of, but the houses seem to be, in spite of this, as well filled as before. Plants of *Cattleya Trianae* were making a good show in its varied forms; and the following *Cypripediums* were in flower:—*C. Druryi*, *caulatum*, *Sedenii*, *caudatum*, *Warneri*, *Dominiannum*, and others; *C. grande* was also showing a fine flower-spike. The delicately coloured *Dendrobium luteolum* was flowering freely beside its brighter ally, *D. litidiflorum*, and overhead were two fine pans of *Dendrochilon* (*Platyclinis*) *glumaceum*, at their best—not one of the most strikingly coloured, but certainly one of the sweetest-scented Orchids we have.

Fine masses of *Cattleya citrina*, on blocks, were growing and flowering freely, as a rule. Mr. Fairbairn told me these plants had been in his charge for some years, and they do not show the slightest diminution in size of plant or of flowers.

Odontoglossum Cervantesi, and var. *roseum*, were flowering side by side, showing the superiority of the latter over the type. Other varieties of *Odontoglossum* were well represented by *O. crispum*, *O. triumphans*, *O. Rossi* in variety, and *O. gloriosum*. A striking object in this house was a compact mass of *Sophranitis grandiflora*, covered with its brilliant flowers. Of a large number of *Dendrobium nobile* some were in flower, large pieces of the pure white variety, *D. nobile album*, being amongst them. These were in bud, and seemed to be quite as free-flowering as the type form. I have seen this variety in bloom, and can speak as to its beauty. It not only flowers freely, but the flowers last a long time.

The work of hybridising has not been neglected here, for I was shown some promising seedling *Cypripediums*. This, as I have often heard it remarked, is a slow part of the business. Granted that it is; by patience and perseverance good results are sure to come, and no one knows excepting those who have indulged in it, how interesting it is to watch the progress of seedling Orchids.

Other departments at The Kilns are quite in keeping with the Orchid-houses, everything being in the best of order and good keeping. I returned to Loch Long feeling amply repaid for my visit by witnessing the results of Mr. Fairbairn's skill as a gardener. *J. Brown, Ashlaroch, Loch Long, N.B.*

FLORISTS' FLOWERS.

THE HOLLYHOCK.

THERE were very few raisers of the Hollyhock in England forty years ago. As far as I can recollect, Messrs. Paul, of Cheshunt, were taking them up. Mr. Baron, a shoemaker, and Mr. William Chater, both of Saffron Walden, had been doing good work for some years previously, and had laid a foundation that other men have built upon. It was stated, then, as it has been since, that Chater's best flowers were raised from seeds obtained from foreign sources; but in a communication of his in the *Florist*, vol. i., p. 323, this is denied. He says, "Neither Mr. Baron or myself ever had foreign seeds; they are all true English sorts. I have seen thousands raised from foreign seeds, but never in my life have I seen more than one or two which I considered worthy to rank as first-rate flowers." I procured a variety from Mr. Rivers, of Sawbridgeworth, which, he told me, he raised from German seeds, I call it *Turantia*; it is novel in its colour, and good in form. At that time the characters of the different varieties had not been fixed, as is now the case; for it is a well known fact, that seedlings raised from a good variety will come as good, and of much the same colour as the parent. There may be 50 per cent. of them below the quality of the parent, but as many will be as good, and some excel it in quality. I fancy Mr. Chater's flowers must have been fertilised by bees, which are very fond of the nectar of the flowers.

Mr. Chater remarked that "some sorts have a

peculiar propensity to sport into opposite characters; for instance, Black Prince will always produce some of a creamy-white, as well as black, and this I am quite certain from the same plant, and I believe from the same seed-pool. Reds again, will produce yellows; and yellows, reds, as well as various tints and shades." The Safron Walden flowers of Baron and Chater were of good form, high in the centre, but rather small. The Scotch flowers are large and flat, with wide guard petals, like Tam o'Shanter bonnets. One of the raisers of Hollyhocks was Mr. John Luig, of Dysart, now of Stanstead Park Nursery, S.E., who was constantly looking out for what he could improve. He tried to cross the Tam o'Shanter bonnet type with the small, neat and high centred Safron Walden Seedlings, and was very successful, and in a few years had almost revolutionised the Hollyhock.

The Hollyhock is hardy enough, but to grow such flowers as may be seen at Newcastle-on-Tyne and other northern exhibitions, they must be wintered in pots in cold frames or in a cool greenhouse. Two classes of plants must be prepared. Those intended to flower from the end of July well into August should be raised from cuttings or single eyes the previous summer or early autumn. The latest flowering plants may be struck from cuttings or root-grafts in the spring; the plants to flower earliest may be planted in April, and the later ones in May. Seedlings are easiest managed, and need no glass protection in winter. Sow the seeds in May, and grow the young plants on in boxes, or on a piece of well-prepared garden ground, until they are large enough to plant out where they are to flower, which will be some time in July. Plant in rows 4 feet apart and 3 feet asunder in the rows; they will flower grandly the following season.

Some good growers in the south have become greatly discouraged, because of the Hollyhock fungus (*Puccinia malvacearum*) attacking the leaves in every stage of their development. The growers in the north have to contend with this same troublesome disease in their plants, but they are determined to have Hollyhocks in their gardens, and struggle on against it as best they can. A theory has been propounded that the forcing in the spring of grafts and cuttings by means of heat has weakened the constitution of the plants, and made the leaves a fit host for the fungus, which shows itself on the under-sides in the form of brown spots, the leaves being sometimes sparingly, and at other times densely, covered with them. My own experience of the last few years may be instructive, or, at the least, of interest to cultivators.

During the winters of 1877-8 and 1888-9 the plants were left out, scattered about in different positions in the flower-garden; at least a third of them were killed by the severity of the weather, and during two seasons the plants flowered fairly well without showing any trace of the disease. As an experiment, all the plants were dug up in the autumn, planted in pots, and placed in a cold pit. Early in the year I set to work to propagate as many plants as possible by means of cuttings. These were taken with a heel, and planted singly in thumb-pots, rather moist soil being employed, as it is not considered safe to water the cuttings at all until roots are formed. They were placed in gentle bottom-heat in a forcing-house, and, to prevent flagging, they were covered with a close-fitting hand-light. Under this treatment all the cuttings made roots, and as they were taken out of the hand-glass, it was found that some of them had taken the "disease." I am sure I do not know where the resting-spores were during the last two years, or in what subtle way the disease propagated itself under that close hand-glass. I am treating it with flowers-of-sulphur in a dry state this year, and I imagine that we shall arrest its further progress. Of course, a mere dusting of the surface would not have much effect, but a careful workman takes the sulphur between his finger and thumb, rubbing it well into the surface of the affected leaves; also dusting all those leaves not diseased. The Holly-

hock stools which were taken up seem to be so far free from fungus, and are ready to be planted out—I left one growth on each stool. The young plants are making good progress, and will be strong enough to plant out where they are to flower early next month. I would here urge the importance of giving the plants very rich deep soil to grow in; the Hollyhock requires rich land, deeply dug, so that the roots may penetrate it easily, which they will do to the depth of 3 feet. A mulching of manure put on the soil after planting is a good aid to healthy growth. I also like to put the permanent stakes to the plants at planting time, so that no injury can occur to their roots by blindly driving them into the soil. It is desirable to place some rich potting soil around the roots of each plant

genial warmth with careful attention as regards ventilation would improve them—but the point to be aimed at in good cultivation is to maintain a growing temperature round the plants from the time the stems of the trusses are visible. Forcing Auriculas into flower in the way that some spring flowers are forced is out of the question; they will not stand it. The only way to apply artificial heat is to place the plants in a position near the roof; the atmosphere should be moderately moist, and the temperature such as will not draw the plants in leaf nor flower stems. In cold weather I do not like the minimum temperature to rise above 40°, and keep the ventilators open a little all night long. All the trusses have strong stems to support them without the aid of sticks, although the natural tendency

FIG. 73.—NARCISSUS GLORY OF LEYDEN: PERIANTH DEEP PRIMROSE-YELLOW, CORONA RICH YELLOW. (SEE P. 433.)

when planting it, especially if the soil be heavy. *J. Douglas.*

THE AURICULA.

We have now passed the middle of April, and whatever turn the weather may take, the season cannot be an early one. The plants in frames, even the earliest of them, are yet in bud, and the cold winds blowing prevent the expansion of the delicate blossoms. Warm nights and moderate sunshine are absolutely necessary for the making of a perfect pip. The edges are always more or less imperfect, and the pips have a poor pinched appearance when the plants are forced or the flowers allowed to open in cold weather. Imperfections, such as serrated edges, arise from excessive cold after the pips are formed, or too much heat to push them into flower; and if they are injured by cold, no after-treatment would develop perfect flowers, although a

of some is to push in a lateral direction, owing to their position on the plants. The stems are not weaker than those that are upright; but they do not look well in such a position, and we place neat sticks to them to keep them erect. Auricula fanciers will not mind the trouble involved in thinning out the pips where they are too numerous on the trusses. Many varieties produce immense trusses, with from twenty to thirty pips on each; when this is the case, a number of the centre pips will be below the medium size, a few will be altogether imperfect—these ought to be removed. Many practical gardeners who have no general knowledge of florists' flowers, nor any particular fancy for Auriculas, may smile at all this trouble, as they call it; but it is really no trouble at all, and an Auricula fancier could not stand by and see well-marked pips elbowed out of place by those that are more or less imperfect.

All offsets of the best varieties should be put in

at once, as with careful culture such will make good flowering plants for next year; and those offsets that are rooted should be potted on as they require it, using moderately rich soil, and rather lighter for the young plants than for full-grown specimens. Greenfly I can deal with, either by dipping the plants, or fumigating the house or frames; but the white aphid (*Trama auriculae*), is a great puzzle, it not only clings round the necks of the plants, covering every part of it, but pushes downwards amongst the roots, and fills up the interstices in the drainage. Recently it has taken another form, and tiny white things have come up from the roots, and have for a time covered the leaves. They do this during the early summer; but I noticed a plant-to-day, a green-leaved variety, thickly sprinkled with it. It is rather unaccountable that no evil effects follow

EDIBLE PINE SEEDS.

The seeds of many of the Conifers form an edible nut in very many countries. Those of the Stone Pine (*Pinus pinea*) are largely used at dessert with wine in Italy, under the name of Pignones or Pine Nuts. The seeds of the following species are edible: *P. albicaulis*, *P. cembra*, *P. Coulteri*, *P. edulis*, *P. Gerardiana*, *P. Lambertiana*, *P. Llaveana*, *P. monophylla* or *Fremontiana*, *P. monticola*, *P. pinea*, *P. Sabiniana*, *P. Torreyana*.

The seeds of the Pine cones are in many instances in Europe and America preferred to Almonds, in consequence of their more aromatic and delicate taste, and their moderate price, which ranges from £2 10s. to £3 per cwt., according to the abundance of the yield. The first quality, Pignones, unshelled,

in quantities by the Indians, as those of *P. monticola*. The seeds of *P. monophylla*, common on the borders of Lower California are gathered by the Indians for food; though rich and good when fresh, they are more digestible when roasted, in which condition they are made into a palatable bread or mush. The interior of the young cones is also eaten. The harvest commences as soon as the cones begin to open. The children gather the cones from the ground, and women pluck them from the trees, lowering their collection from time to time in a net. To facilitate the opening of the cones, they are thrown on hot ashes for a few minutes; the seeds are then removed, put into an earthen pot over a slow fire, and after a few stirrings, are sufficiently parched to render the husk brittle, so as to be easily removed.

The nuts of *P. Torreyana*, a very rare Pine, growing only on the hills in Southern California, are also used as food by the Indians near by. An average cone will contain about 130 large and wholesome seeds, weighing 3 ounces.

The *Pinus pinea* is cultivated for its edible seeds, which has a taste resembling Sweet Almonds. They have, when kept, a resinous though not a disagreeable taste, and should be left in the cones until they are about to be used, as otherwise they speedily become rancid. They only ripen in their third year.

In Switzerland the seeds of the Stone Pine are used both as food and an article of luxury. The shell being very hard, and requiring time and skill to separate it from the kernel, the doing so forms an amusement for some persons in the long winter evenings.

The clustered heavy cones of *P. Sabiniana* of California and the Rocky Mountains attain a length of 1 foot. The edible seeds are produced in great profusion, and constituted formerly a large proportion of the winter food of the native tribes.

The large cones of *Araucaria Bidwellii* shed their edible seeds, which are 2½ inches long by three quarters of an inch broad. They are sweet before being perfectly ripe, and after that resemble roasted Chestnuts in taste. They ripen in the month of January every three years; the natives prefer them to any other food. They are known as *Bunya Bunyas*.

The Pignones of the imbricated-leaved Pine of Chili are a chief article of consumption among the Indian tribes. As the seeds will keep long, they are often imported into the southern districts of Chili from the Cordilleras, and are eaten by the country people either raw or cooked. The seeds are buried by the Indians for winter use. *P. L. Simmonds.*

THE APIARY.

A NEW SUPER CLEARER.

NOVICES have often had much trouble in clearing supers. If they are removed entirely away from the hive, the bees will often get so frightened, thinking that their honey is going to be taken away, that they will have a good feed before they start. They will open a lot of the cells, and partly empty them of honey. Sometimes they will tear open more cells than necessary for their purpose, and thus many sections would be spoilt; and if the honey is in some large super, and required for show, it would be unfit for the purpose. Under these circumstances, it is pleasant to welcome a new automatic super-clearer, which will, doubtless, be advertised in due course. Its great advantage consists in the fact that the rack of sections is emptied in the hive, and when empty it is only necessary to go and lift it off, and carry your honey triumphantly away. It requires to be seen to be thoroughly understood; but, to be brief, it consists of a half-inch board, with passages for exit. If the bees had the sense given to some animals, they would be able to return into the super; but though bees seem to have marvellous powers in some respect, they are very stupid in others. For instance, if a hive is removed only a few (2 or 3) yards away, the bees cannot find

FIG. 71.—NARCISSUS MADAME DE GRAAF: WHITE PERIANTH, CREAM YELLOW CORONA. (SEE P. 383.)

these raids upon the leaves, any more than they do from an attack upon the roots. A florist friend remarked recently that the aphid lodged upon the Auriculas but did not board there, and was met by the pertinent query, "Where did they board, then?" For my part I cannot answer the question, but they resemble very much the white woolly aphid that lives or lodges upon Lettuce roots. I have seen, as others also have seen, the roots of full-grown Lettuces covered with this insect, but the plants were apparently uninjured, and yet they must get their sustenance from the plants in some way, or why should they cling so pertinaciously to them. *J. Douglas.*

FLOWERS IN THE SCILLY ISLANDS.—Two hundred tons of flowers, 800 tons of Potatoes, 150 tons of vegetables, 3 tons of Seakale, and 5 tons of Tomatoes, were sent last year from Scilly. The rate of carriage to Covent Garden is, says Mr. BERWICK, 7s. *fid.* per cwt., and the salesman's charge 10 per cent., if he supplies boxes.

are chiefly consumed in steamboats during long voyages, or for dessert at the principal hotels, either by themselves, or mixed with Sicily Almonds. They are shipped in small cases of half a hundred-weight to 1 cwt.

The seeds of *Pinus albicaulis* are used as food by the Indians of British Columbia. The nuts of *P. Coulteri* of California, are nutritious. Those of *P. edulis* of New Mexico, are produced in immense quantities, and are of a very pleasant flavour.

Of the seeds of the Nevada or edible Pine of Nepal (*P. Gerardiana*), there is a local proverb, "One tree support a man's life in winter." The seeds are collected and stored for winter use, and largely eaten by the hill tribes as Nuts, especially in Afghanistan and Kafiristan; they are brought to India by the Afghan traders. The edible seeds of *P. Lambertiana* of California, are edible, and much appreciated; so are the large seeds of *P. monophylla*, of the Rocky Mountains, of an Almond-like flavour, which are consumed

their way back to it, and blunder hopelessly about, till entering other hives, they are killed. In this super clearer the bees can easily find their way out, but cannot find their way back again. They can hear the hum of the bees, and try to enter the super by impossible ways, only to be frustrated. Thus the super may be raised in the morning, the clearer put underneath in position, and in the evening you could go and fearlessly remove your supers, carrying them away without a bee, and perfectly sealed.

It will be necessary to see that robbing does not commence, as when it once commences it is very difficult to stop it. The cause is generally opening the hives to feed, and perhaps spilling a few drops of syrup about. One very good plan has lately been mentioned in the *American Bee Journal*, but it is not new, as I have frequently tried it myself. It is to put a piece of glass in front of the hive being robbed, so that the bees can come out at the sides. The robber bees will not be able to discover the way in, but will keep giving themselves bumps against the glass, and will finally give up the attempt in disgust. *Bee.*

THE ALPINE GARDEN.

SAXIFRAGA RETUSA.

EVERY week in early spring we read praises of *S. oppositifolia*, which I admire very much, but I never see *S. retusa* (Gouan) mentioned. Its cultivation is similar; hot sun and drought must be avoided, and plenty of finely broken stone given above and below ground. It flowers far more densely than any form of *S. oppositifolia*, and arranges itself more elegantly, and is more compact in habit, every shoot being crowded with flowers from the base to the tip. It flowers here about a fortnight later than *S. oppositifolia*.

PRIMULA ANAÏNA.

To save trouble, as this plant is so often confused with *P. cortusoides anaïna* (see p. 272), it may as well be stated that the two plants are widely distinct in nearly all their parts. *P. anaïna* of Bieberstein, the Caucasian plant, about which I enquired, has entire leaves, like those of the common English Oxlip; in fact, some botanists have considered it a purple variety of *P. cortusoides*, or *P. elatior*. The varieties of *P. cortusoides*, or *P. Sieboldii*, all have incised pinnate or lobed leaves, and an entirely different habit of growth. Max Leichtlin, of Baden-Baden, had *P. anaïna* once, but I am afraid he has lost it. Hot and dry lowland summers, and red-spider, are deadly enemies of these rare forms of Primrose. *C. Welby Dod.*

COLONIAL NOTES.

D U R B A N.

THE Report of the Natal Botanic Garden for the year 1889 has reached us. In it Mr. Medley Wood chronicles for the fifth year in succession a deficiency in the rainfall, which amounted to 29.2 inches, an amount which, in this country, we should deem adequate, but which is 11 inches below the average in Natal, where the temperature and light are so much more potent than with us. The consequence is, that Palms and other fine trees have greatly suffered, and some are dead. The report in question also contains a descriptive list of the most useful economic plants grown in the garden, with notes on their probable use in the Colony.

C A P E T O W N.

Professor MacOwan's report is tinged with bitter disappointment, as it will be. "To run the garden on the principle of one-third grants and two-thirds earnings, was not a dignified way of keeping up a public institution," but it was a possible one when the garden had the practical monopoly of the

trade. But now the garden has six trade rivals competing with it, and taking from it the profits with which it was kept going. Under these circumstances it is no wonder that the garden profits are decreasing, and that there is little hope of remaining solvent, "unless expenditure can be brought down within the lean ribs of income. . . . There is only one way of doing this: it is by confessing that the Cape Colony does not care to carry on the gardens as a scientific establishment, throwing overboard the director, the salesman, and the seed shop, and leaving the head gardener with his native labourers to do what he can with the place as a pleasure of common flowers and gravel walks." "I regret most bitterly that after having for nine years fought the place clear of debt, amid anxieties no tongue can tell, I cannot honestly predict any better future than its dropping out of the list of scientific establishments through sheer poverty and grovelling on as a mere pleasure-ground for the town children and chance visitors." It

at this time of year should be given to keeping the plants free from mealy-bug, for should this insect increase with rapidity as it will with higher temperature, a liberal use of the syringe will check the spread of thrips and red spider; and frequent fumigation is also desirable. More attention will be necessary to check the overheating of the apparatus during the early part of the day, so as to utilise the sun-heat fully at an early hour, and thus save the fuel. Hard firing at night during cold weather should be avoided, and the blinds should be made use of to this end, and securely fastened down on cold nights. Many plants, as their pots fill with roots, will take weak liquid manure, made of Clay's Fertiliser or other. Palms and other strong growers which remain for years without being re-tubbed, should be assisted occasionally in the same way.

The early-flowering Allamandas and similar plants which should be growing freely now and forming their flower-buds, will require a few loose ties to keep them away from the roof-glass but giving full sunshine. Ixoras making rapid growth will require looking over diligently, to prevent mealy-

FIG. 75.—NARCISSUS TRIANDRUS VAR. PULCHELLUS; FLOWERS WHITE. (SEE P. 493)

would seem from other passages in the report, that the best way is to clear out from the present garden, and establish a new one for purely scientific economic and experimental purposes elsewhere. To compete with the nursery trade is unjust to the traders and to the ratepayers, and a waste of energy on the part of the managers of the garden.

PLANTS AND THEIR CULTURE.

THE STOVE.—The inmates of this house should be making good progress, and, if easterly winds prevail, much care will require to be paid to the ventilation and staling. By using the shades judiciously, currents of dry parching air need not be admitted. The temperature may be increased slightly as the days lengthen, and may range from 70° to 80° during sunny weather, but the minimum should be reached in dull weather; and 65° to 70° at night. At closing time the house may be allowed to run as high as 90°, closing early in the afternoon and syringing freely. Every minute that can be spared

bug making headway, as it is impossible to clean these plants entirely of the insects when the flowers are formed. The autumn bloomers should be started, shortening them back and placing them on mild bottom-heat. Cuttings of Gardenias should be propagated, taking off large healthy shoots for this purpose.

Anthuriums will soon be in full bloom, and should be kept drier overhead to preserve the spathes and their high colour. Caladiums should be potted into small pots, and placed in bottom-heat to start; and the stock of tubers may be increased by taking off the young growth with a heel and potting them. Basket plants should be planted so as to give the plants time to establish themselves, shading them for a time only, that is, till the new growth is able to bear the full light without flagging. Cuttings of Coleus may be put in, destroying the old plants as soon as enough young ones have been secured. Furnishing plants should be struck in quantity, such as *Ficus*, *Selaginellas*, *Panicum variegatum*, *Tradescantias* of sorts, *Fittonias* and *Cyprus*. Plants of *Cissus discolor* should be shortened back, and placed in a warm moist house; this plant looks well grown in any way, and especially if grown in small pots. The cuttings soon make nice

plants if taken off with a heel, and placed in a light compost in bottom-heat, in a case. The old plants are useful for covering bare walls, in shady corners, on a trellis, and as basket plants; the cuttings will also strike freely when cut at a joint. Gloriosas should be placed near the light to prevent weak growth, and any tubers not yet started should be reotted and placed in a moist temperature of 70°. Achimenes started as previously advised will be ready to transfer to pans and baskets, and in doing this the young tender roots must all be preserved. Any of which there is a deficiency should be increased by cuttings made of the tips of the young plants put into sandy peat in a warm pit, and closely shaded. Another lot of tubers should be started for later blooms. Seedlings in pans should be pricked off into small thumbs or pans before they get drawn, and placed near the light, for if neglected in their earlier stages, they seldom make good plants afterwards. *Geo. Wyth's, Syon House, Brentford.*

THE ORCHID HOUSES.

In the Pleioneas are now filling their pots with roots, and the plants are growing strongly, a little manure-water may be afforded them. Guano and diluted cow-urine will encourage growth, but they must be given with caution, as too strong an application will be certain to do injury. *Odontoglossum grande* will now be showing root activity, and plants that may require to be reotted should be taken in hand. This plant resents being disturbed at the root, but it must be done at least once in two years. They do well in a compost consisting of lily peat, with the fine particles of soil knocked out of it, and sphagnum moss. *Vanda aculeata* may now be syringed overhead every fine morning, and placed near the ventilators, where there is a free circulation of air, as anything approaching a close atmosphere causes the plants to "spot" badly. The later plants of *Miltonia vexillaria* will now be pushing up their flower-spikes, and may safely have weak guano-water applied to the roots, that is, at the rate of 1 oz. of guano to 1 gallon of water. This stimulant should not be given oftener than once a week, clear rain-water being given at other times. The temperature may now be 60° at night, with a rise of 10° by sunheat. Shading should receive careful attention. A few years ago, Orchids were always killed by having too much shade given them, and now grave errors are made in the contrary direction. *A. G. Carr, Parkfield, Worcester.*

THE FLOWER GARDEN.

Lawns.—The grass has commenced to grow freely, and mowing must be followed up regularly, if the lawns are to be kept in fine order. The edgings of walks, flower-beds, and borders should be clipped weekly, after having once pared the edges with the edging iron, thus lessening the chances of increasing the number of weeds on the walks or beds by the edging grasses going to seed.

Halls.—Where weeds are few, hand-weeding is best; but where they abound, the gravel, if loose, may be hoed and raked. For walks of hindering gravel, an application of common salt, or one of the advertised weed destroyers, will be successful; in every case taking care to prevent any of the mixtures used from touching the evergreen edgings or turf.

Trees and Shrubs newly planted, more especially on light sandy soils, should receive a thorough watering, and be well mulched with leaf-mould, rotten straw manure, or the like.

Gladioli.—Make the principal planting of these roots to be followed by successional plantings at intervals. Those that were planted at first are now showing above ground, which should be kept frequently hoed and stirred.

Annals.—Seeds of the following may be sown:—*Mignonette*, *Godetias*, *Clarkias*, *Larkspurs*, *Mari-golds*, *Candytufts*, *Nemophila*, *Linums*, *Collinsias*, *Convolvulus*, *Coreopsis*, *Escholtzias*, *Saponarias*, *Salspiglossis*, *Nasturtiums*, *Poppies*, *Hibiscus*, *Mimulus*, *Virginia Stock*, and *Venus's Looking-glass*. From the above species, selections may be made of nearly every colour, and which will give pretty effects during the summer months. Sow now, Wall-

flower, *Antirrhinum*, *Silene*, *Canterbury Bells*, *Sweet William*, *Polyanthus*, *Primrose*, in the open borders, for blooming next spring.

Perennials are best sown in pans, boxes, or frames, and transplanted to the open borders; such are *Penstemons*, *Phloxes*, *Genms*, *Campanulas*, *Carnations*, *Pinks*, *Picotees*, *Delphiniums*, *Aquilegas*, &c. Make another sowing of *Sweet Peas* and *Asters*. *Sunflowers* sown now singly in pots will be advanced enough to plant in the open in May and June.

As *Polyanthuses* and *Primroses* finish flowering, having first noted their colours, they should be taken up, divided, and planted in their summer quarters in the reserve garden. As the plants in the spring flower garden go out of bloom, the beds should be prepared for their summer occupants, so that when the season and weather permit these may be planted. *D. C. Powell, P-well Chan Castle, Devon.*

FRUITS UNDER GLASS.

VINES.—The operations previously described as being requisite, must now keep pace with the increased demands of the Vines; these include thinning the bunches and berries, training-in leading shoots, tying laterals down to the wires, great care being exercised with *Black Alicante*, *Gros Colmar*, *Lady Downes*, and other brittle kinds, these being best brought into positions a little at a time, doing the work in the course of a fortnight; at the same time the points of the shoots must be kept from touching the glass, but beyond this it is better to leave the shoots free till the setting process is completed, and when they will be less liable to break. It is prudent to keep some dry pollen of *Black Hamburgh Grapes* for artificial fertilisation of *Black Morocco* and other shy setting varieties, for it, owing to any cause, this variety once fails to set a crop, the wood becomes so strong that there is a very great difficulty in keeping the Vine in order. With *Black Morocco*, the syringe, even when boldly used on the Vines in flower does not always accomplish the setting of the flowers; at the same time I would recommend its use for *Muscats*, provided the foliage can be perfectly dried again before nightfall, and sufficient fire-heat employed to maintain a circulation of air and a temperature of 70° during the night, a few degrees lower in frosty or windy weather doing no harm. The day temperature may range from 80° to 90° with sun and air; and a moderate supply of atmospheric moisture may be afforded in the forenoon.

Figs.—In the early house fructification will now be nearly completed, and the forwardest Figs will be swelling rapidly. Atmospheric moisture must be slightly reduced when the period of ripening approaches, or the flavour will be poor. Take advantage of favourable opportunities to thoroughly syringe the trees at intervals, or red-spider will get a footing—a pest most difficult to eradicate. Stop a few shoots occasionally, with the object of getting fruit in succession; and do not train shoots too rigidly, but allow of some degree of freedom and extension. *W. Cramp, Malvernfield Court, Malvern.*

THE HARDY FRUIT GARDEN.

THE BLOOMING OF THE FRUIT TREES.—Under the impression that a late spring is the one thing needful in securing a bountiful crop of fruit, we are apt to rejoice when the opening of the blossoms is retarded beyond what is usual. Seldom have fruit trees been later than this season, and yet, on the whole, the winter was a mild one. The *Apricot*, which is the first to open its blossoms, is followed closely by the *Peach* and *Nectarine*, and I have noted that they have shed more or less blossoms before opening in such a season as the present, than when the weather has been less favourable, and yet have retained just enough for a crop. A continuance of low temperature will, I am afraid, do mischief by hindering the flow of the sap at a time when its circulation should be unrestrained.

Disbudding is an operation that should be done in piecemeal fashion at intervals of a few days, so as to avoid any great check to growth. Green and black aphids are sure to be troublesome at this stage of growth, and particularly if the wind continues to blow from the east or north. Remedial measures

must be taken the moment these aphids are perceived and tobacco powder applied by means of a puff or dregler is one of the best. Prune the points of the lateral shoots of *Apricots* at the second joint, and practice a moderate amount of disbudding, otherwise the close clustering together of spurs tends to shade the fruit and young wood too much, and the latter, if immature, does not set its bloom the coming season. The fruit should be thinned at an early stage of growth, and as it usually forms clusters, these, if not thinned early, produce many deformed fruits.

Marble Cherries are liable to be overrun with black aphids, and sometimes this will occur before they open their blossoms. This disaster may be prevented, and labour saved, if the walls and trees have a thorough syringing of soap-suds, and robust growth encouraged by liberal supplies of manure-water to well-established trees.

Strawberries.—The mulching which was applied some time ago should now have a good sprinkling of soot, to ward off the attention of slugs. Place hand-lights, frames, cloches, or other glass protection over the earliest varieties, so as to avoid gaps in the supply, if these be feared. The earliest forced plants, if protected and insured, gradually, will now be ready to plant out, and this kind of work should not be delayed if good crops are looked for next season.

Grafts will require an occasional examination, filling up the cracks in the clay, and rubbing off all shoots coming from the stocks. The cold winds have had a retarding effect on the leafing of Apples, and these may still be grafted. *A. Evans, Lythe Hill, Haslewood.*

THE KITCHEN GARDEN.

BROCCOLIS AND KALES.—The main crop of *Broccolis* and *Kales* should now be sown on beds, made moderately firm after sowing, to induce strong healthy growth; and a poor soil should be avoided, as it not unfrequently produces root-clubbing with its attendant evils. If the plants are to remain in the seed-beds till planted out, the sowing should be done thinly in drills of half an inch deep. The position of the beds should be open to the sun. *White Sprouting Broccolis*, *early* and *late Purple*, are invaluable in spring, and should be sown at this time. *Asparagus* and tall *Scotch Kale* are the only two varieties of *Kale* that we grow, and the latter is preferred to the former. *Broccolis* now turning in should be examined daily, breaking the leaves over the forward heads.

Chicory, *Salsify*, and *Scorzonera* should be sown; the ground for these should have been trenched and enriched, but not recently. A distance of 12 to 18 inches should be allowed between the rows—the plants, when large enough, being thinned to 8 inches apart.

Carrot seed should be sown in trenches, heavily manured if the soil be light. The seed may be dropped in patches of three, 15 inches apart, and the plants thinned out to one in each patch. If more than one row is required, the rows may be 4 feet apart.

Carl's Giant.—Plant out those wintered in frames, and if *Autumn Giant* is among them, it will form a succession to the *Early London* and *Walcheren* varieties; but now there are so many early dwarf sorts of the *Erfurt* type for early summer use, the *Autumn Giant* is not so much called for. Those raised in heat and putted-off will require abundance of water and good ventilation. If in proper condition to plant, some of these may be planted out on warm borders, protecting them against frost and wind with inverted flower-pots or some other means.

Onions for pickling may now be sown, and on almost any soil that is not rich, but is dry and well exposed; sow the seeds somewhat thickly, broadcast fashion, and allow all plants to remain to mature. The flower-heads of *Trippis* must be cut off as soon as they appear, and by so doing the plants will bulb readily. Keep the hoe plied amongst the plants, and if large bulbs are required, leave plenty of space for each to grow. Dustings of soot, and a little guano afforded occasionally, will hasten growth.

Turnips.—The *Snowball* and *Veitch's Red Globe* varieties may be sown on well-prepared borders, but do not sow large breadths, as these early sowings often get a check from frost, and run to seed without forming a bulb. *H. Markham, Mereworth Castle, Maidstone.*

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, APRIL 22 { Royal Horticultural Society: Fruit, Floral, and Scientific Committees, and Lectures on Primrose and Auriculas, by Rev. C. W. Dod and Mr. Henwood.

SHOWS.

so large as it was expected to be, partly because many of the kinds had passed their best; partly because, among professional gardeners, as contrasted with amateurs, there is less interest felt in Daffodils. The gardener proper is naturally keenly interested in fruit and vegetables; the Grape Vine has inexhaustible interest for him, and he waxes enthusiastic in the ardour of his delight over the "mum." To a less extent a similar difference between the taste of the expert and that of the amateur is observable in the case of Roses. Every one likes Roses; but we must look among the ranks of the country gentlemen—and of the provincial clergy in particular—for that burning passion which leads them to speak of the competitions

This practice is objected to by some, on the ground that the removal of the "grass" impairs the strength of the bulb, and prevents its flowering so well as it would otherwise do in the following season. But, as was well said, if the bulbs are so few in number, or so weak as not to permit of the removal of the small number of leaves required, they are not, except under special circumstances, fitted for the exhibition table. The exhibition of the "grass" with the flowers may be advocated, because in no other way is the beauty of the flower so well shown, in no other way can the delicate gradations of tint and the exquisite harmonies of colour be shown. Again, the differences between the flowers as cut and displayed on the exhibition table are often infinitesimal, and yet, when seen growing along-

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—49° 3.

The Daffodil Conference.

WHEN compared with the highly useful Vegetable Conference, and the very popular Chrysanthemum meetings of last autumn, the Daffodil Conference held at Chiswick during the present week, although more numerous attended by the public, and by amateurs, takes a second place in the estimation of gardeners. The exhibition was, on the whole, excellent, but scarcely

of the exhibition tent in language that would befitt the historian of Sedan or Gravelotte. We cannot pretend to explain this difference between the taste of different classes of plant lovers. Its existence is at once a good thing for horticulture, and an excellent illustration of the catholicity of gardening, and its suitability to the tastes and fancies of all conditions of men.

The Daffodil exhibition, opened by H.R.H. the Duchess of Teck, in the presence of a large number of visitors, is reported on at length in another column, where it will be seen that a small number of exhibitors contrived to fill the large area of the conservatory at Chiswick. Among the exhibitors were Messrs. BARR, WALKER, VEITCH & SONS, H. VEITCH, POUPART, WILKS, and the authorities of the Royal Gardens, Kew. The representation of forms and varieties was very complete for the season. Mr. BARR had the good taste to inaugurate an innovation by showing the foliage with the flowers.

side of others, and even when a few are associated with the flowers, the difference becomes obvious. To the physiologist, the study of these minor variations and minute differences in connection with the history of the plants is of very great interest and importance, and from this point of view we cannot conceive any more instructive exercise, than the careful study of all the varieties side by side, as they may be seen in the collections of the principal growers.

But whilst the botanist is specially interested in these variations, and in the lessons they teach, it is certain that the amateur, and the ordinary lover of flowers, are right in their contention that there are too many forms submitted now-a-days for public approval, and that the differences between them are too infinitesimal. From this point of view the Narcissus Committee is doing good service by refusing to place upon its register forms which are not considered by the members as sufficiently different from others, or

VIEW IN THE PLEASURE GROUNDS AT MENTMORE.

which are not decided improvements upon other forms. The committee is not one whit too severe in its process of expurgation. Indeed, it is to be desired that no permanent Certificate should be awarded till the plant has been actually tested in more than one locality, and its adaptation to particular purposes ascertained. To award a Certificate to a single flower placed on the exhibition table is an unsatisfactory procedure, at best. In place of registering it at once, it would be better to select such forms as were thought promising, and to recommend them for trial at Chiswick and elsewhere. The "Certificate of Recommendation" would be a sufficient encouragement for the exhibitor in the first instance, and this Certificate might be followed next season by a more permanent mark of approval, but until this ordeal has been gone through, the plant should not be permanently registered. Some such process is the more desirable, as it is unquestionable that some of the forms are not "fixed," in the gardener's sense, but are subject to degenerate, and to hark back to the original type.

Another point in which the Narcissus Committee might exert its influence very advantageously is by encouraging raisers and hybridists to exercise more accuracy and care in their procedures, and especially in their records. The history of not a few of the hybrids is obscure, or even only a matter of guess-work. Many of these obscurities, and much of this conjecture, could, as was well shown by Mr. Engelhardt, be dispelled in two or three seasons by a few well-devised and properly chronicled experiments. Haphazard cultivation and promiscuous fertilisation may be very pretty and very amusing, but for real progress we must look to cultivation and to experiments based on sound physiological and cultural principles.

The Conference proper was opened on Wednesday by Professor MICHAEL FOSTER, who alluded to the progress that had been made since the former Conference in 1881, and specially to the circumstance that that meeting was held under depressing conditions, whereas now the Society was meeting in its own garden, and under the shade of its own Vines (at least, under such shade as their present nearly leafless condition permitted). Dr. FOSTER alluded to the work the Narcissus Committee had set itself to do in adjusting the nomenclature of natural and of artificial forms, counselling that only those forms that are really distinct should receive separate names, and that the names given should be such as could be easily written and pronounced, and, if possible, have some relation to the things signified. Alluding to the discussion originated by Mr. DYER, in these columns, as to empirical as compared with scientific knowledge in matters of cultivation, Professor FOSTER said that all real knowledge is of use if rightly applied, and that no knowledge is of use if applied wrongly. The Chairman then distributed the awards made by the committee, as reported in another column.

Mr. SCRASE DICKENS, the Secretary of the Narcissus Committee, reviewed the objects of the Committee, and the work accomplished by it since its formation in 1881. He pointed out that considerable additions had been made to our knowledge of the natural history of Daffodils, and of their cultivation, and that several new introductions had been made. Experiments had been made to test the allegation that single Daffodils could be changed into double ones as a result of cultivation, with the result that it was proved that double Daffodils might be produced from the same bulb that produced single flowers, and that seedlings from the double produced some

single, some double varieties. The root disease was commented on, and allusion made to the register which now contained the names of fifty-four varieties, recognised by the Committee as the best of their class in constitution and other characteristics.

Mr. BURRIDGE followed with a paper on the history of the Daffodil, and of those workers chiefly concerned in its production. The substance of this is given in another column. Some discussion arose, in the course of which Mr. WOLLEY DOD said that, according to ARISTOTLE, bees only visit one kind of flower at one time, but this was traversed by Mr. WILKS, who mentioned that he had seen in his orchard-house, bees visit Pear blossoms after Peach blossoms, and *vice versa*.

Mr. ENGELHART then favoured the Society with an extempore statement referring to seedling Daffodils, which proved to be of very great value and interest. He pointed out how the origin of various crosses and hybrids once unknown or uncertain, had now been proved by actual experiment. He alluded to a cross made by Prof. FOSTER between a white hoop-petticoat Narcissus and one of the triandrus group. Mr. ENGELHART further stated that the results of crossing a trumpet Daffodil with the pollen of a Jonquil has resulted in the production of a "tridymsus" form in which the flowers were clustered, and fragrant as in the male parent, and, like it, yellow. The *Narcissus incomparabilis* had been supposed to be a cross between a Trumpet Daffodil and *N. poeticus*, and the truth of this supposition had been proved experimentally by Mr. ENGELHART. When *N. poeticus* var. *ornatus* is employed as one of the parents, a more shapely flower is produced than where the original *poeticus* is employed. From a cross between a double white *cernuus*, fertilised with the pollen of a single Trumpet Daffodil, Mr. ENGELHART had produced an early white creamy Daffodil, as well as other forms. As to the origin of *ornatus*, Mr. ENGELHART supposed it to be a selected form of *poeticus*, as seedlings from it revert to *poeticus*. Seedling raising is tedious work at first, as the operator has to wait four or five years before seeing any results, and when he does see them, not more than 1 per cent. were improvements on the old forms. Details were given as to the method of impregnation, and the raising of seedlings. Mr. ENGELHART'S impromptu discourse was one so practically and scientifically valuable that he will, it is to be hoped, be induced to commit his remarks to paper, in order that they may be printed in the Society's *Journal*.

Of the proceedings on Thursday we are unable to give any account this week, as we go to press on that day. We can only add, that it was pleasant indeed to see such a goodly company in the old garden at Chiswick on the two first days. On the first day, as has been stated, the Exhibition was visited by the Duchess of Teck and her daughter, while among the visitors on the second day was the Baroness BERDETT CURTIS.

MENTMOR, LEIGHTON BUZZARD (See Supplementary Sheet).—Mentmore, a palatial mansion and large estate, the residence of the Earl of ROSEBURY, came to him by marriage with Miss HANNAH ROUSSELD, daughter of Baron MEYER ROTHSCHILD. The mansion, of which we reproduce a view of the south front (fig. 76), is situated on a low hill, an offshoot of the Chilterns. From the broad terrace-walk, which extends round the south, west, and north-west sides, extensive views are had of the rich and fertile Vale of Aylesbury. In this vale are situated some very extensive orchards of Plums and Damsons, and in the fruit season many tons are sent off weekly from Cheddington and the adjoining stations, to London and other markets. The mansion, a large and magnificent structure of Ancaster stone, is built

in the Italian style, from designs furnished by Sir JOSEPH PAXTON, and carried out in detail by his son-in-law, Mr. GEORGE H. STOKES, architect. The building was erected by Mr. GEORGE MYERS, of London, and was begun in 1851. On the southwest front are situated the "Fountain Gardens." The design of these consist of a series of water-canals with stone edgings; and Box with grass round the beds which are of large size, and are always filled with plants whose flowers are of one colour. Round this garden are placed large vases of marble, and a sloping bank; which is planted with *Mahonia aquifolia* kept dwarf by being cut back every year. This is surrounded on three sides by a hedge of Yew, also kept in order by the shears. At the western end of the terrace an "Italian flower garden" is placed, with edgings of Box round the beds, and of Ivy and turf next to the walks. A sloping bank surrounds this garden, and is planted with H.P. Rose, General Jacqueminot, whose shoots are pegged down to the soil, and sheltered by a Yewhedge on two of its sides. One side of this garden is screened from view of the offices by a tall hedge of Irish Yew. There are numbers of marble and bronze vases placed in this garden. Near these gardens are two large mounds wholly planted with *Aucuba japonica*, which here forms a striking mass of bright-coloured foliage. On the south side there are no flower-beds, only lawns, and large beds of evergreen and flowering shrubs. Here are large beds planted with many hundreds of Golden Yews, whole beds being of nothing else; also large beds of *Berberis Darwinii*, *Mahonia*, Japanese *Acers*, *Rhamnus*, and other dwarf shrubs. The Myrtle-leaved Portugal Laurel grows well here, and forms fine masses of dark green foliage. Near the east front of the mansion is a high bank planted with *Juniperus chinensis* and *Mahonia*; behind these, higher up, is a line of *Thujaopsis borealis*, interspersed with *Lahurnans*, *Lilacs*, and other flowering and evergreen shrubs. At the end of this bank, nearest the mansion, are planted large masses of *Pinus austriaca* and *P. laricina*, which grow remarkably well. The view seen in the Supplementary Illustration is one that was taken in the subtropical garden, which is from 2 to 3 acres in extent, and surrounded on all sides by a tall belt of Scots Pines, having a thick undergrowth of common Laurels and other shrubs. The surface of the ground is undulating, and is surrounded by high banks of evergreen and flowering shrubs. We can only find space to mention a few of the many plants growing here, viz., splendid groups of evergreen Oaks, of large size; *Bambusa gracilis*, which have been planted out more than fifteen years, and are now conspicuous masses of graceful foliage; *B. metake*, also grown now into large masses; *Osmanthus ilicifolius*, which flowers freely; large *Acer negundo variegatum*, *A. polymorphum rubrum*, and other Japanese varieties; *Thujaopsis dolabrata*, which grows freely; *Liquidambar styraciflua*, *Aralia Sieboldii*, *Cupressus Lawsoniana crecta viridis*, and many others.

GREAT HORTICULTURAL EXHIBITION AT BERLIN: APRIL 25 TO MAY 5.—*Aprisus* of this exhibition, which is to open on Friday, April 25, Professor Dr. L. WITTMACK, Secretary-General, advises all who are interested in grand shows to go and see it. There will be not only a large number of fine plants and products from Germany, Belgium, the Netherlands, Austria, Italy, and England, but especially a splendid architectural and artistic display; the chief purpose being to show how gardening architecture and art may be united, the exhibits in this section consisting of decorated rooms, balconies, verandahs, staircases, &c. There will be nearly 600 exhibitors, and the space required 7200 square metres, 5000 of which will be under cover. Twenty-nine thousand marks will be expended in prizes, and many honorary and State prizes are offered. The Emperor, who is protector of the Horticultural Society of Prussia, has given a large Gold Medal; the Minister of Agriculture, Honorary President of the Exhibition, 500 marks. Science, in its connection with horticulture, will likewise be represented.

KEW AND COLONIAL APPOINTMENTS.—We are sometimes asked how appointments in the Government Gardens of our Colonies and India are to be obtained. They are invariably filled by the Kew authorities, who select suitable men from among the young gardeners employed at Kew. The positions to which these men are appointed are often of great importance, some of the most valuable servants of the Governments of the Colonies and of India having been originally young gardeners at Kew. We have been favoured with a list of the appointments made since the beginning of 1888. The training the men receive whilst at Kew is such as will enable them to discharge the duties of these appointments satisfactorily. Lectures and the use of a library rich in botanical, horticultural, and other scientific works, together with the practical training they get whilst performing their daily duties, afford excellent opportunities to young men who wish to get on, and who are not afraid to work to that end. Applicants for admission as gardeners into the Royal Gardens, Kew, must be between 20 and 25 years of age, must have good testimonials, and must have been employed not less than five years in good private gardens or nurseries. The following young gardeners have been sent from Kew to Colonial and Indian appointments since January, 1888:—

- A. SHAW, March, 1888, Assistant Curator, Melbourne, British Government.
 W. E. BROADWAY, June, 1888, Assistant Superintendent, Trinidad, British Government.
 W. CHADWICK, July, 1888, Superintendent, Canehana Gardens, Jamaica.
 R. PROUDLOCK, December, 1888, Assistant Curator, Calcutta, British Government.
 G. WOODRUFF, February, 1889, Head Gardener, Niger Territories.
 A. HARTLESS, March, 1889, Assistant, Darjeeling.
 W. THOMSON, July, 1889, Superintendent, Kingston Gardens, Jamaica.
 H. BAREILLE, August, 1889, Head Gardener, Niger Territories.
 P. YEWARD, August, 1889, Curator, Fiji Botanic Station.
 A. G. TILSON, September, 1889, Curator, Antigua Botanic Station.
 C. PLUME, September, 1889, Curator, St. Kitts Botanic Station.
 W. CROFTHER, January, 1890, Curator, Arenal Botanic Station, Gold Coast.
 H. POWELL, April, 1890, Curator, St. Vincent.

THE STOTT INSECTICIDE DISTRIBUTOR was to be seen in action in the Royal Horticultural Society's Gardens at Chiswick during the Daffodil Conference. The distributor consists of a metal cylinder, which is divided into several cells by means of perforated partitions. Into these cells the manure or insecticide, in solid or liquid form, is inserted. At each end of the machine is a length of tubing, one end being attached to the water-tap or garden-pump, and the other to an ordinary hose-pipe, and the water being forced through, becomes impregnated with the composition in the cells. The strength of the solution is regulated by the filling of one or more cells of the apparatus. A special form of spreader is fitted to the hose, which ensures a perfect spray. The apparatus is likely to prove of much service, and cannot well get out of order. An insecticide, "Killbright," supplied for use in the machine, is of a soapy consistency. The spray can be used for the destruction of such pests as green-fly, thrips, black-fly, &c.

"BOTANICAL MAGAZINE."—The April number contains coloured illustrations and descriptions of the following plants:—

Passiflora Carderi, t. 7108.—A graceful Palm, with long pinnate foliage, the pinna linear lanceolate acuminate. The flowers are minute, arranged in loose branching pink panicles. It is a native of Guatemala, where it was discovered by Mr. Carder, and is the *Gonoma Carderi* of Bali's Catalogue for 1874.

Sisano sphacelata, t. 7109.—A creeping glabrous perennial Cucurbit, with cordate, roundish, three to five-lobed leaves; lobes sharply pointed; flowers bell-shaped, with a tubular calyx, with five ovate, pointed, spreading green lobes, and a large bell-shaped creamy-yellow corolla, also divided into five

broad hairy segments. It was discovered in Jamaica by Mr. Morris, but is supposed to have been introduced from some other country.

Peliasanthus albida, t. 7110, a botanical curiosity with tufted plicated lanceolate-stalked leaves, and long straight spikes thickly studded with small greenish-white six parted flowers like those of *Ophiopogon*. It is a native of the Malay peninsula.

Isis orchoides, t. 7111, a species with foliage like that of the Day Lily, *Hermerocallis*, and with yellow flowers. The flowers are yellow, outer segments erect, spreading at the apex, beardless, inner segments very much smaller; spatulate deflexed. It is a native of Central Asia.

Vanda Kimballiana, t. 7112.—This is the very beautiful *Vanda*, originally described in *Lindley's*, t. 204, and afterwards alluded to at pp. 165 and 201 of our last volume. It is near to *V. Amesiana*, but differs in the very narrow leaves. This plant is also figured in the *Garden*, for April 5; but the latter figure, though more artistic, shows none of the peculiarities of the lip.

"THE JOURNAL OF THE ROYAL AGRICULTURAL SOCIETY."—The contents of the part just issued comprise an interesting account of the foundation of the Society, which dates from 1837. This is followed by an article entitled, "Fifty Years' Progress of British Agriculture," by Sir JAMES CAIRD, Mr. JOHN DENT contributes a paper on Agricultural Education at Home and Abroad. The food of our agricultural crops is treated of by Sir JOHN LAWES. Mr. CARRINGTON details the results of further experiments and observations made by him on English pastures, and reiterates his opinion that Rye-grass should be excluded.

CYRTANTHUS PALLIDUS.—Mr. O'BRIEN has favoured us with a flower of this species, which is of great beauty. The numerous flowers are umbellate on the top of a long slender cylindrical stalk. Each flower is about 1½ inch long, with a small cylindrical ovary, and a tubular lower abruptly deflexed just above the ovary. The limb is divided into six equal rounded, shallow lobes. The colour of the flower is of a delicate orange-pink. The stamens are in two rows, growing in attachment to the perianth tube at different levels, and shorter than the long three-fid style. The plant is much to be recommended for grace of form and delicacy of tint.

AGRI-HORTICULTURAL SOCIETY OF INDIA.—The annual report shows that the Society has lost during the last twelve years 20,000 rupees, while the receipts have not been equal to the expenditure. This is owing entirely to the depreciation in the value of the rupee.

OLEARIA LYRATA.—To Mr. GUMBLETON we are indebted for a specimen of *Olearia lyrata*. The slender purple young shoots, as well as the under surface of the lance-shaped leaves, are covered with white meal. The individual flower heads are small, but arranged in close branching clusters at the ends of the branches. The ray florets are very narrow, strap-shaped, and surrounded by an involucre of numerous very narrow linear bracts. Mr. GUMBLETON informs us that with him, near the sea, in co. Cork, the shrub is quite hardy, and at this season covered with bloom.

FRITILLARIA ACOMPETALA.—Mr. GUMBLETON obliges us with a flower of this species, to show how much larger the flower becomes under cultivation than was the specimen figured at t. 6321 of the *Botanical Magazine*. The specimen before us has the upper leaves linear lanceolate, the bell-shaped flower drooping nearly 2 inches in length, 1½ inch across the mouth. The outer segments are narrowly lanceolate, green, broad at the base, recurved at the tips. The inner segments are narrow at the base, broadly obovate, with a reflexed acumen, green flushed and finely streaked with purplish-brown. Owing to the disproportionate width of the outer and inner segments respectively, the broad and

coloured inner segments occupy the wide intervals between the narrow green outer segments, so that the flower appears to be striped with alternate bands of green and purple. The inner surface of the segment is glossy. It is one of the prettiest species of the genus.

"CARTER'S PRACTICAL GARDENER."—The fourteenth edition has been issued, and as it contains a variety of practical articles on the management of different departments of the garden, it may be safely recommended.

"DAYS AND HOURS IN A GARDEN."—A seventh edition of this dainty little volume, by "E. V. B.," has just been issued by ELLIOT STOCK, in dainty fashion. The substance of the volume, it may be remembered, was published in these columns, and no greater commendation is needed than the fact that it has passed through so many editions, and given delight to so many readers.

CHRYSANTHEMUMS.—No fewer than a thousand varieties are cultivated in the Jardin des Plantes. These are studied carefully year by year for the purposes of classification, rejection of synonyms, &c.

THE GHENT HORTICULTURAL MEETINGS.—M. Oct. BRUNNEL, the Secretary of the Syndicate of Belgian nurserymen, has just issued a complete list of the plants premiated at the periodical meetings of the Society since its establishment six years ago, and which will form a useful work of reference to those who wish to keep an *ouvroir* with horticultural progress in Ghent.

SPRING FLOWERS.—Messrs. VAN C. G. VAN TUBERGEN, of Zwaneburg, send us a box of flowers which is very tantalising, as they evidently were once interesting and beautiful, but they were "wrecked" in transit, and the names were not attached.

THE HORTICULTURAL CLUB.—The usual monthly dinner and *conversazione* took place on Tuesday, April 8, at the rooms, Hotel Windsor, Victoria Street. The chair was occupied by the Rev. W. WILES, and there were present besides the Rev. E. HANDLEY, Messrs. COUSINS, DUBERY, WALKER, &c., Mr. W. INGRAM being the guest of the Club. Afterwards a most interesting paper was read by Mr. C. T. DUBERY on the "Wonders of Fernland." It was illustrated with some excellent diagrams and some beautiful specimens of dried fronds. The paper dealt very carefully with the germination of Ferns. It was stated that in the case of all Ferns, whether the gigantic Tree Ferns of New Zealand, &c., or the delicate Maidenhair, the spores from whence the plants proceed are absolutely microscopic. He then showed the various methods of propagation, the ordinary one by spores, and the abnormal ones of bulbils and apospory. It was shown that of all the species of British Ferns there were to be found tasselled or crested forms, and Mr. DUBERY believed that if the habitats of the foreign Ferns were searched as carefully as our own land has been, similar departures from the normal growth would be found. The paper was a model of what such papers should be—severely correct as to its botany and scientific side, yet delivered in language that any intelligent hearer might understand, even although previously unacquainted with the subject. A cordial vote of thanks was given to Mr. DUBERY for his valuable paper. We may add that Messrs. W. THOMSON of Drumlanrig, and Mr. BRUCE FINLAY of Manchester, will be the guests of the Club at a special dinner on the 22nd, on the occasion of their receiving the Veitch Memorial Medals, and a large gathering of the members is anticipated.

"MALESIA."—The last part of Signor BECCARI's valuable publication contains a history of the genus *Pritchardia*. Nine species are admitted, some natives of Fiji, others of the Hawaiian Islands. The genus *Phoenix* is also monographed, ten species, with their synonyms being described. Two plates, showing the

structural peculiarities, are given. No one interested in Palms can afford to disregard these monographs. An index completes the part, which terminates the third volume, and which is also, we are sorry to add, announced as volume iii. "et ultimo."

LINNEAN SOCIETY.—At the meeting of this Society on April 3, Mr. CARUTHERS, F.R.S., President, in the chair. Mr. JOHN LOVE was admitted, and Rev. J. T. SCOTT elected, a Fellow of the Society. Professor P. MARTIN DUNCAN exhibited a transverse section of a coral *Caryophyllia clavus*, showing septa and irregular theca between them. Mr. B. D. JACKSON exhibited some seeds of *Mystacidium filicetum*, an epiphytic Orchid forwarded from South Africa by Mr. HENRY HUTTON, of Kimberley. The meeting adjourned on April 17.

STOCK-TAKING: MARCH.—The usual returns are to hand, and do not present an over-encouraging aspect. There is a check to both production and export, but this is not of necessity an unmixt evil. The great industry of cotton import, manufacture, and export has been checked by serious over-production; the manufacturing section of the industry has been disarranged at home by the coal-trade disputes, bankers are holding their hands, political disturbances creep in to widen the "rent within the commercial lute," which will doubtless be to some extent prevented from "broadening down" by a season of enforced inactivity—rather, of lessened activity. Some lessons are to be learnt from these returns, which, however, it is not our place to teach, these most deeply, or immediately, interested will have taken them to heart by this time. The following excerpts from the general summary of imports from foreign countries and British possessions will be found of interest to our readers.

	1889.	1890.	Difference.
	£	£	£
Total value of imports	36,222,287	36,155,141	-67,146
{H.—(A). Articles of food and drink—			
Wheat, &c.	10,947,240	11,921,628	+974,388
(B). — do., dutiable	2,934,349	2,975,297	+40,948
{VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)	9,912,575	8,456,701	-1,455,874
{VII.—Raw materials for sundry industries and manufactures (including wood, tanning, leather, iron, split, dressed, vegetable materials, for paper making, &c.)	2,628,179	2,655,141	+26,962
{IX.—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ..	1,193,150	1,669,712	+476,562
(B)—Barred Beef ..	35,591	39,112	+3,521

Fruit and vegetable growers will be interested in the annexed figures—in the "plus" items especially:

	1889.	1890.	Difference.
{H. Fruit—			
Apples, raw	347,395	397,716	+50,321
Unenumerated, raw	16,959	16,299	-660
Onions	27,929	147,000	+119,071
Potatoes	31,821	18,964	-12,857
Vegetables, raw, unenumerated	2,174	2,424	+250

THE GENERA OF POMACEÆ.—Dr. E. H. KOHNKE has recently published a monograph on this subject. He admits twenty-two genera, and keeps up *Malus* as distinct from *Pyrus*. The whole paper is in German, but two lithographic plates give details of structure intelligible to observers of all nationalities.

THE WEATHER AND THE CROPS OF 1889.—Mr. MAWLEY has contributed to the *Journal of the*

Royal Meteorological Society a detailed account of the weather of the past year in relation to vegetable life. The year is taken to begin in September. In October premature frosts checked vegetation, but in November growth started again, and continued more or less up to March, when severe frost was experienced (as in 1890). May and June were very favourable months, whilst July and August were wet and cold; on the whole, the year "proved an unusually gay and bountiful one."

SPORTING DAFFODIL.—For the specimen whence our illustration (fig. 77) is taken we are indebted to Mr. WALKER. Two distinct varieties

FIG. 77.—SPORTING DAFFODIL.

sprung from one parent bulb, the one being the double N. incomparabilis, the other Silver Phoenix. The only plausible explanation of the occurrence is that it is due to the sudden separation of previously mixed characters, such as happens so often in *Chrysanthemum*. The bulb, with its offset still attached, and enclosed within one bulb-scale, will be planted to see what happens another season.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The quarterly meeting of the above Society was held at the Caledonian Hotel, Adelphi Terrace, Strand, on Monday evening last,

Mr. NATHAN COLE in the chair. The Committee are very pleased to report that the Society is making very satisfactory progress, fifteen new members having been elected at this meeting, making a total of thirty-two during the quarter. Messrs. LANE & SONS, of Berkhamstead, have also joined the list of honorary members. The sick-list has been a heavy one, chiefly due to the influenza epidemic, £31 7s. 8d. having been paid to sick members during the quarter, but at the present time there is but one member on the sick-list. A convalescent fund is being established, to assist members to get a change of air after illness.

"KEW BULLETIN."—The April number of this publication contains information concerning a new tanning material called *Canoigre*, alias *Gonagra*, alias *Gonagra*. It appears that this substance consists of portions of the root-stock of *Rumex hymenosepalum*, which is found in abundance in the sandy soil on both sides of the Rio Grande, and northward over a large portion of Western Texas and New Mexico. The root resembles gambier in its action. The plant might probably be readily cultivated in hot, dry, sandy localities, and at the present price of gambier would be a valuable addition to the resources of the tanner. Other articles relate to the cultivation of the *Pistachio* nut in Cyprus, and to the production of sugar in India.

"L'ORCHIDEENNE."—At the last meeting on April 13, the following awards were made.—Diplôme d'Honneur of the first class, for *Odontoglossum triumphans* var. *Hyeaenum*, from M. J. Hye-Leyssen; Diplôme d'Honneur of the second class for *Odontoglossum crispum* var. *Merit*, from M. Peeters. Certificate of Merit of the first class for *Odontoglossum vexillarium* var. *splendidum*, from M. Linden; for *Odontoglossum* sp., from M. Warocqué; for *O. Rossi* var. *purpureum*, from M. Van Imshoort; for *O. nebulosum*, from M. Peeters; for *Cattleya Mossiae* var. *Madame Arthur Warocqué*, from M. G. Warocqué; for *O. Mendelii*, from M. J. Hye-Leyssen; for *Oncidium sarcochloa*, from M. le Dr. Capart; for *Calyce Skinneri* alba, from M. Peeters; for *Calyce cristata* alba, from M. Peeters; for *Epidendrum Wallisi*, from M. Peeters. Certificate of Merit of the second class for *Cattleya speciosissima* var. *Regina Olga*, from M. le Prince Mestchersky; for *Miltonia Warszewiczii*, from M. Van Imshoort; for *Odontoglossum triumphans*, from M. J. Hye-Leyssen; for *Odontoglossum* sp., from M. J. Hye-Leyssen. Certificate of Culture of the first class, for *Odontoglossum luteo-purpureum*, from M. G. Warocqué; for *Adiantum*, from M. Peeters; for *Cypripedium hirsutissimum*, from M. Peeters. Certificate of Culture of the second class, for *Odontoglossum Reichenheimi*, from M. G. Warocqué; for *O. Edwardii*, from M. Linden; for *Cymbidium eburneum*, from M. Peeters; for *Adiantum*, from M. Linden.

THE PROCESS OF FERTILISATION.—M. GUANXIN, in papers presented to the French Academy of Sciences, shows that the process of fecundation in plants (and in animals), consists essentially in the fusion of two nuclei, one derived from the male or pollen-parent, and one from the female. No union takes place between the male and female chromatic segments. The process consists therefore in an amalgamation of soluble matter derived from the nuclei, and the nucleus of the female or egg undergoes no change until the male nucleus has undergone a special change.

LATE-FLOWERED CHRYSANTHEMUMS.—Mr. FRENCH, East Hendre Gardens, Stevenage, sends a few blooms and buds of *Chrysanthemum Fair Maid* of Guernsey. It is an interesting fact that plants of this variety have been blooming since Christmas. The plants, he tells us, had their shoots stopped last October, and were wintered in a cool vinery.

HOME CORRESPONDENCE.

ACER PLATANOIDES, THE NORWAY MAPLE.—

The Acers are a favourite class of deciduous trees to plant in the garden and park. Most of the Japanese varieties require shelter from the cold quarters, and are liable to injury by frost; but the Norway Maple *A. platanoides*, the sycamore *A. pseudo-platanus* are splendid trees, developing into large specimens when planted in suitable soils and positions. At this date (early April), we have examples of *A. platanoides* in full bloom, the trees being lovely objects in the landscape, covered with greenish-coloured flowers in great profusion. The trees are from 40 to 60 feet high. I do not remember the trees to be so early in bloom as this season, and so well covered. These trees at Syon are sheltered from the quarters whence come the cold winds, but are not favoured with a good soil, and they are planted near to the water in a soil that is heavy and wet, but notwithstanding these disadvantages the trees grow well. *A. platanoides* is a rapid grower, and it is not very particular as to soil and position, as it will exist and grow vigorously in the most exposed situations, but when it is sheltered from easterly winds it becomes very beautiful and is always admired. Acer is a large genus, all do not grow so large as the variety I have named. Some of them are useful for small gardens, being of low growth, besides being distinct from other trees. The great variety shown by the fading leaves in autumn adds much to the effect of shrubberies and groups. The varieties of *A. palmatum* are well adapted for garden planting, the fine-cut foliage and diversified colour rendering them excellent trees for this purpose. They must be afforded ample room to grow and show off their crowns to advantage, and the shelter afforded by neighbouring shrubs just suit them. *G. Wythes, Syon Gardens, Brentford.*

TUBEROUS-ROOTED BEGONIAS.—Where a great number of these are bedded out, I find it best to start them into growth in cold frames, the growth being in these places more robust than in warmer ones. In getting the frames ready, one foot in depth of warm dung is put at the bottom, trodden firm, and then sandy soil to the depth of six inches, in which the bulbs at 6 inches apart are planted. Until growth begins, very little water is required, but the syringe is used to sprinkle the bed twice or thrice daily, the frames being kept close until growth has attained a height of two inches, after air is admitted freely, and tepid water afforded them. By the beginning of June the plants are fit to put out in the open air. The beds should be deeply dug, but not too deeply, and a good dressing of rotten manure incorporated with the soil. Seedlings of this species of Begonia raised this season may be pricked off as soon as they can be handled, in pans of sandy compost made firm and watered beforehand. Keep the pans in gentle warmth for a time. *H. Markham.*

THE ANNUAL PRIMULA FESTIVAL.—The prospects of a good exhibition of Auriculas at the Drill Hall on Tuesday next are decidedly satisfactory. The Auricula exhibitor is now practically independent of weather. No one who sets out with the intention of becoming an exhibitor of the fine show Auriculas, would erect a house for the purpose without providing the means of artificially warming them when required. It has become a necessity for those who exhibit in the third week in April. In unheated houses Auriculas have come forward with surprising slowness, owing to the cold winds and low temperature. The quickest to move into blossom are the selfs; they expand their pips in much less time than the stately greens; they move with a kind of majestic slowness, as becomes the highest order of the floral aristocracy. A gentle artificial warmth by night, so as to maintain to some extent the solar warmth by day, helps the expanding pips materially, not only is time gained, but the floral advance assumes finer proportions also. A week's soft genial weather previous to the show cold-house the temperature rules so low by night that the slowly expanding pips appear almost to halt and would be found of the greatest advantage. In my rest. A northern aspect at flowering time is doubly retarding; happy are they who, devoid of artificial heat, can yet give their plants a change to a southern aspect during the months of March and April. I have a truss of George Lightbody that has been expanding its pips for a fortnight, but with such a funereal slowness that fully another ten or

twelve days will be required to have them fully opened. The alpines are quicker in developing their flowers, but the texture of their petals is not so solid. I imagine we shall have a very fine display of alpine varieties; they will not only be very numerous, but thoroughly good. One of the finest seedling I have ever raised has just expanded a large and finely-formed pip, maroon ground, with a broad shading of bright mauve. It came from Mrs. Dollwell, crossed with George Lightbody; it has the large size and stoutness of the former, with something of the colour of the pollen parent; but, alas! the anthers which should form the flower-eyes at the top of the tube are low down in it, and the pistil rises above them; but it will make an excellent seed parent, though some raisers take exception to the employment of a pin-eyed flower for breeding purposes. The remaining members of the Primula family should be well represented, though it has been a very trying time for Primroses and Polyanthus in the open. Dust covered, and nipped by frost and drying winds, they have experienced the rigours of our inhospitable spring climate. Warm southerly rains and kindly sunshine will greatly help the flowers, and enable them to be seen in their best character. *R. D.*

FIG. 78.—LILY-NARCISSUS NARCISSUS. PRINCE OF WALES. (LILY-YELLOW; FRAGRANT.) (SEE P. 493.)

STANDARD-BEARER CELERY.—Mr. Wythes, in *Gardeners' Chronicle*, p. 459, in speaking of this Celery, claims for it superiority over others on his light soil, and I may venture to say that it is the best we have had for late use. We are now (April 15) using it daily, and it is in good condition. Our soil is very stiff, and especially where the Celery has been. My opinion is that this variety and Major Clarke's Red are the two best late Celeries in cultivation. *W. A. Cook, Coampton Bassett.*

FOGS AND PLANTS.—The sad story told by Mr. Wythes of the evil effects of local fogs upon plants and fruits at Syon, does but serve to emphasize the fact that the culture of various plants, including many hardy ones, is becoming exceedingly difficult within the metropolitan fog radius. If I think these visitations are as harmful on the western side of London as anywhere, it is because low cold depressions in the air usually produce them, and the low depressions which create fogs invariably come from the east: thus we get on this side of the metropolis not only the fog, but all its worst concomitants in the shape of sulphureous smoke, the fog being laden with foul and destructive gases. Shutting out ordinary daylight for many hours is bad enough, swamping the plants literally in a bath of cold vapour is bad enough; but when that vapour is permeated

with pernicious gases, and even substances, soot especially, then is the case of the plants bad indeed. Well enough may a gardener, coming from the comparatively pure air of Worcestershire, wonder at the failures arising from fog which he found at Syon. A few years since one could grow garden Anemones here in beautiful form. The fogs now destroyed every portion of leaf made during the winter, and in the spring the plants are so weakened in consequence, that they bloom very sparingly. As to the effect of the fogs on the Violets here, that is a matter to be viewed with considerable alarm by growers. There is some doubt as to whether a fungus is operating to destroy leafage, as the evil has shown itself considerably in rural districts; but the blame of the defoliation which now almost invariably follows upon November fogs, is very naturally attributed to the fogs. Where scores of acres of single Violets are grown for bloom-production, this loss of foliage is a serious matter, and one leading to the fear that ultimately Violet culture near London may become impossible. Such a result would indeed be a misfortune to our market gardeners. *A. D.*

HARDY SHRUBS IN FLOWER AT DROPMORE.—It is surprising that we do not find *Andromeda floribunda* more often met with, coming into flower as it does very early in the season—this year in February—and lasting so long in flower. In the shrubbery border it has been an object of beauty for the past two months, and has withstood 20° of frost without injury. Its clusters of Lily of the Valley like flowers are useful, when cut, for vases, and look fresh for a considerable time. The plant will grow freely in any light soil that suits the *Rhododendron*. Plants of *Magnolia conspicua* are just at the present time unfolding their flowers, which are of pure white. It is hardy, and of somewhat slow growth, and is well adapted, therefore, for such a position as the centre of a large bed of herbaceous plants. The flowers have endured 8° of frost without being injured. *Beberis Darwinii* is a shrub of great merit as a simple specimen on the lawn, or in the shrubbery border. It is, at the present time, very showy, the long and somewhat pendulous branches being festooned with its orange-coloured flowers, and these contrast well with the small dark foliage. Of *Rhododendrons* several early-flowering varieties have been in full beauty for some weeks, and although we have experienced frosty nights they have escaped without much injury, being planted in sheltered situations. One specimen of *R. Dauricum*, with purple-pink flowers, is about 12 feet high, and flowering profusely. The leaves are large and handsome, and they are covered with a chocolate-brown tomentum on the under side. Some varieties of *R. Nobleanum* are also very showy, and several others of lighter shades, probably seedlings, a few of which I have forwarded. *C. Herrin, Droppore.* [The small trusses of several seedlings sent bear out our correspondent's statements. *Ed.*]

EXPORT OF FLOWERS FROM THE ISLAND OF SCILLY.—On Tuesday, the 1st inst., 2500 packages of flowers were sent to the various nurseries in England and Scotland; in this consignment were included upwards of 100,000 bunches of ornatus; 30,000 alone were sent from the Abbey Gardens Narcissus Farm, Tresco, belonging to the lord proprietor, J. A. Dorrien-Smith, Esq. *H. Trunkins.*

MONTBRETIA POTTSII.—The treatment we give our plants perfectly agrees with J. U., Mid-Sussex. We allow it to spread, and never lift or interfere with it, save to give a slight forking-in in early spring, and top-dressing. It flowers well every summer. *Hon. Mrs. Hope, Belmont, Murreyfield, N.B.*

THE BIRMINGHAM PRIMULAS.—In a few remarks you were pleased to insert last week, you refer to the flowers and foliage sent to you as showing indications of coarseness, and in a communication to you I stated that both were from nearly exhausted plants now set aside for seed. In a younger state the flowers are smoother and finer, and challenge bending on all points. At Messrs. Pope & Sons, King's Norton Nurseries, these fine Birmingham raised varieties are to be seen, amongst them some new varieties. Princess Louise stands out prominently amongst whites for its good habit, throwing the flowers well out of the foliage, and of large size and remarkable substance. A seedling variety not yet sent out is a great advance upon the scarlet section, of which Chiswick Red and Brilliant are types. The flowers of this seedling are much larger,

bright crimson scarlet with large yellow centre. Pink Queen is deeper in colour than Her Majesty, and is in colour very like Sutton's Pink, but with the distinct foliage and large flowers of The Queen. The King, Fern-leaved, is what may be called a red variety of The Queen, with flowers of the size of Marquis of Lorne, but brighter in colour, and a very fine variety. D. S. H.

RAPID APPLE STOCK BUDDING.—Remembering an article which appeared in your paper of September 21, 1889, upon the above subject, in which is recorded a wonderfully quick piece of work, viz. the budding of 1,850 Apple Stocks in one day by Mr. A. Hagger, the foreman at Messrs. W. & J. Brown's Nurseries, Stamford, I thought I should like to know the result of this feat; accordingly, I asked Mr. Hagger what was the result of his rapid work, and he at once invited me to inspect them, and count the deaths for myself. As the stocks upon which the buds had failed were cut down for grafting, it was an easy matter to count the failures. To my surprise, I found there were only 75 deaths in the 1,850 worked Stocks, being a fraction under 1 per cent. of deaths. I then examined the live buds, and found them to be all plump, and ready to burst into growth. I thought the result of the above-mentioned piece of work might be interesting to some of your readers, especially those who noticed the article of September 21 last, and who, like myself, might wonder whether quantity and quality were combined, or if the latter was sacrificed. There are many thousands of fruits and Roses budded at this nursery every year, and the same results characterise the whole—that is, where the stocks are young and healthy. *Arthur W. Edwards, Elmslie Garden, Stamford.*

CALLA ÆTHIOPICA.—I should be glad to know if there are two varieties of this plant, a large and a small flowered one. Amongst the plants of Calla grown here, are fine, strong, healthy plants, which only throw up very fine spathes; they receive a greenhouse temperature, and are well fed with manure-water, &c. *F. Kerr.* [What treatment do the plants receive? Ed.]

CONFERENCE TOMATO.—I was surprised to read in your notice of Mr. Walker's farm at Ham, p. 433, mention of Conference Tomato as not "to be depended upon outdoors." Mr. Walker, if he has grown this variety outdoors, has doubtless been favoured with an advance packet, as the variety was distributed from Chiswick only during the past winter. With regard to its outdoor properties, I took careful stock of the variety as grown outdoors at Chiswick last year, and found it to be a remarkable fruiter, the fruits hanging on the plants like remarkably like ropes of Onions, as there was no deception about it, and a large number of kinds were being grown at Chiswick at the same time; Conference being especially numerous. The trial was a fair one, and this variety stood in the front rank of croppers. I mention this to encourage the growth outdoors of a variety which has come into commerce under such promising conditions. Its parentage is so good, and the place of its production the one of all others where ample trials of all possible varieties are afforded. As I have found the seed of the variety furnished to me to have germinated without heat, and in a not very warm greenhouse so profusely, whilst seed saved from home-grown fruits has not come so well by one-half, I am tempted to inquire, seeing that so much of the Conference fruit was produced outdoors at Chiswick, whether it is in the experience of others that outdoor ripened seed germinates more readily than do house-grown seed. I base this query on the assumption that my Chiswick seed was from outdoor plants. Still, it may not have been, therefore the remarkably free germination found would seem to be rather attributable to the variety. The point, all the same, is worth raising. Does outdoor-grown seed germinate more freely than do seed grown under glass? *A. D.*

ANEMONE FULGENS IN THE ISLANDS OF SCILLY.—The growth of *Anemone fulgens* in the islands is of recent date, but so much has it found favour, that it has increased fifty-fold, some growers cultivating as many as 50,000 roots. On being first introduced, cultivated roots were in great demand, but at the present time collected roots have the preference. Cultivated roots cannot be depended on after the second year, but collected roots will do fairly well for twice the time, and are less in price. The quantity of flowers produced from roots not

more than 1 inch long and a little thicker than the stem of a tobacco-pipe, is almost incredible; such roots yield from six to eight blooms each during the season, which extends for three months. Good cuttings can be made twice a week during that period. I have been cutting from beds ever since the early part of January, and while I am writing they are in full bloom. Some of the blooms I have cut have measured 38 inches in diameter, or over 10 inches in circumference. I know of no other plant that is so productive of flowers, which always find a ready sale at prices varying from 9s. to 2s. per dozen bunches of one dozen blooms in a bunch. I am rather inclined to think that the profusion of blooms is the cause of premature decay. Hitherto no attempts have been made to raise them from seed, but trials are to be made this season. *J. C. Tomkins, St. Mary's, Isles of Scilly.*

LARGE CROWN OF SEAKALE.—Accompanying this I have sent you a very large crown of Seakale, which weighs 3 lb. 11 oz., and is the largest I have

brought forth only two exhibitors, referred to below and, indeed, the display proper was made by the grand representative collections of Messrs. Barr & Son, Mr. J. Walker, Messrs. J. Veitch & Son, Mr. Poupard, and the collection from Kew Gardens. Mr. Wilks' collection in the competition must be accorded praise, as displaying evidences of high cultivation. The method of staging the large collections was a happy innovation, the varieties of each section being placed together, and thus a capital opportunity for the comparison of the merits of the numerous varieties was afforded. The last great Daffodil Conference, which was held in 1884, evoked more interest than the one just past, and the exhibits were more numerous, but the six years which have intervened have allowed many valuable additions to be made to the list of Daffodils, many of which deserve to be largely grown; this is especially the case in the Barri and Leeds sections.

The attendance on the first two days, when the weather was fine and warm, was very satisfactory.

The Daffodil Show.

Messrs. Barr & Son, King Street, Covent Garden sent an extensive collection, representing all classes. There were 200 varieties represented, but were shown several times over, which added much to the display. The bunches were arranged with a sprinkling of their own foliage, which relieved the glare of colour generally produced by a collection of Daffodils and Narcissi. We select the most conspicuous flowers for size and colour. The glory of Leyden, which made a certain sensation when first shown at South Kensington some few years ago was very striking (fig. 73). It is a bloom of much substance. Golden Spur, Emperor, Captain Nelson, Countess of Annesley, Johnstone, Mrs. G. Cammell, Spurius, Henry Irving were also well represented. Of the Ajax bicolors, Dean Herbert, and the pale delicate J. B. M. Camm. Among the pale coloured Ajax forms, the chief was Madame de Graaff (fig. 74), with a delicate rich cream trumpet. Albicans and tortuosus were also good.

The flowers grouped in the Incomparabilis, Barri, and Leeds sections (which were grouped together) made the brightest display of any, the rich orange-red of the smallest cup being very pleasing. Gloria mundi (a novelty last year) was very fine; Queen Sophia, Frank Miles, Sir Watkin (fig. 72), Beauty, Barri, Crown Princess, and several bunches of Barri conspicuous, showing how the perianth is deep yellow in the young flower, fading as it ages. Maurice de Vilmoren should also be named.

In Leeds forms, Duchess of Westminster, Palmerston, Mrs. Langtry, and the almost white Gem were the best; Barbuleci, Baroness Heath, Princess Louise, Constance, Falstaff, Nelson, G. J. Backhouse, Backhouse, and Crown Princess, were also shown; and of other sections, Capax plenus, Codlings and Cream, Eggs and Bacon, &c., with various tazetta types.

Mr. J. Walker, Ham Common, Surrey, contributed a collection of over 100 varieties set up in large bunches without foliage. The flower was large and bright. This was a lot of the most useful varieties for general work, and of these the best shown were Aurantius, Nelsoni, Sir Watkin, Beauty, Cynosure, Princess Mary, Minnie Hume, Mrs. Langtry, W. Ingram, Barri conspicuus, Maurice de Vilmoren, Beatrice Murray, Falstaff, ornatus. The various double Incomparabilis, the numerous flowers of the Emperor, Empress, and maximus types, were very fine, with large flowers of good substance. The delicate J. B. M. Camm, cernuus pulcher, and Leda (tortuosus), were also fine.

Mr. Poupard, Twickenham, sent a smaller collection of very good quality blooms, including Madame de Graaff. Among the more numerously represented were Orange Phoenix, Incomparabilis fl.-pl., Maximus Horsfieldi, grandis, Emperor, Pœticus ornatus, Beauty, Duchess of Brabant, Titian, M. de Vilmoren, conspicuus, Princess Mary, Cynosure, Campmelle, B. M. de Graaff, and Sir Watkin.

Messrs. R. Veitch & Son, Exeter, had a few varieties represented. There were several N. moschatus, Horsfieldi, Emperor, Triandrus alba, Cynosure, and Sir Watkin.

From Messrs. Jas. Veitch & Son, Royal Exotic Nurseries, Chelsea, came a considerable number of varieties, the distinguishing feature being a group of about fifty Tazettas; among them were Queen of the Netherlands, white, with gold-yellow cup, large flower—an uncommon variety; Soleil d'Or, dark yellow and red-orange cup, very distinct by reason of the colour of the cup; Princesse de Metternich, like

FIG. 70.—VARIEGATED MAJALAE BURBANK WHITE. (GROWN IN GARDEN, 1887, P. 60.)

ever seen. I shall feel obliged if you can find room in your paper to mention this. It was grown by me, at Millshot Farm, Fulham, *Wm. Engly.* [The crown sent was very large, and bore ten good-sized offsets, besides numerous smaller examples. Ed.]

SOCIETIES.

ROYAL HORTICULTURAL.

THE DAFFODIL CONFERENCE.

April 15, 16, 17, 18.—This meeting, which was held in the Society's Gardens, Chiswick, was opened on Tuesday last by H.R.H. the Princess Mary, Duchess of Teck, who was received and conducted round the conservatory, by the Rev. W. Wilks (Secretary). A large and elegant bouquet of Daffodils, made by Mr. Garcia, Covent Garden, was presented to Her Royal Highness, on her arrival, by Miss Frances Thibault Dyer.

As a floral display, the show fell short of expectation, the entries being few. Two Silver Challenge Cups were offered for amateurs, but these

the Queen of the Netherlands, but darker cup; Adonis, large flower, petals broad, deep, yellow, and cup rich orange; Grand Monarque, Bathurst, Gloriosa, White Pearl, Intermedius, Bifrons, &c. The *Tazettas* are very pretty forms, but, unfortunately, are not quite hardy in England. Among the larger-flowered section the best were Golden Spur, Maximus, Comtesse of Annesley, Henry Irving, Empress, Horsfieldi, Emperor, albicans, cernuus, Barri conspicuus, C. J. Backhouse, aurantius, Stella, Sir Watkin (fig. 72), Katherine Spurrell, poeticus poetarum and p. ornatus, odorus, trilobus, and the double Incomparabilis.

The Royal Gardens, Kew, had a representative collection of 150 varieties. They were well grown, fresh, and bright, and comprised a selection of the best sorts. The following were among the best as shown. There were the favourite large trumpet forms, and pallidus, praeox, Cynosure, Gog, Queen Sophia, King of the Netherlands, Albert Victor, C. J. Backhouse, Beauty, Splendens, and Sir Watkin of the Incomparabilis section; conspicuus, Maurice de Vilmorin Duchess of Westminster, Duchess of Brabant, Madame M. de Graaff, and W. Ingram of the Barri and Leeds section—all very showy; Mad. M. de Graaff (fig. 74) having a short, expanded pale cinnamon-yellow cup; and other noticeable forms were Hume's Giant, W. Wilks, Nelsoni, Backhousei, Burbidgei, poeticus ornatus, p. angustifolius, triandrus albus; and of *Tazettas*, States General, gloriosa, and Etoile d'Or, with the popular doubles.

The schedule comprised twelve classes, representing the various groups. Some of these are distinct, and easily recognisable, while others merge one into another by so many and such slight gradations, that it is difficult and sometimes impossible to define them in words. If this is the case in the main groups, much more so is it in the case of the individual forms, which are now reckoned by hundreds. In the following notes we have selected several of the best as illustrations, specimens having kindly been placed at our disposal by Mr. Barr, Mr. Walker, Mr. Hartland, and others. Very great differences exist in the "grass," or foliage, of some of the varieties, but of this we have rarely been able to take note, as the specimens were mostly exhibited without the leaves. Many fine varieties are necessarily unrepresented, so that the absence of a note upon a particular variety must by no means be taken as an indication of inferiority. We could only take note of what was before us. The only way to study the forms efficiently is to pay a visit to a named and classified collection like Mr. Barr's, at Surbiton, and note the variation on the ground.

Class 1. The *Corbularia* section includes the hoop-petticoat *Dafoedils* of popular phrase. They all belong to the species *Narcissus Bulbocodium* of Linnaeus. The species grows wild in Spain, Portugal, South-west France, and North Africa, varying to such an extent that several of the forms have been considered worth specific names. The white variety, *N. Bulbocodium* var. *monophylla* is the most interesting of them, but requires to be grown under protection. It is reputed difficult to be cultivated, albeit of such vitality that a bulb in Mr. Munby's herbarium was found to have retained its vitality after an incarceration of a quarter of a century.

Among the other forms, *conspicua* is notable for its size, *citrina* for the pale sulphur-yellow of its crown, *nivalis* for its small flowers. All these flower early, and exhibit every gradation in size and colour.

The Ajax section of the schedule comprises the *Dafoedils* proper, with the large trumpet-like corona as long as the segments, or nearly so. The varieties of this section, which corresponds to the *Narcissus pseudo-Narcissus* of Linnaeus and of Baker, are beyond computation. They differ in size, from the tiny *minimus* to the giant *Emperor*; they vary in colour from pale sulphur to orange. In the programme, the division is made into self-coloured forms (class 2), bicolor forms (class 3), white or sulphur-coloured forms (class 4). In the following enumeration we have included some forms which, technically, do not belong to this section, but which resemble them closely.

Class 2. The Trumpet *Dafoedils* (Ajax group): *Glory of Leyden* and *Madame de Graaff* are described elsewhere. Among the best are:—

Comtesse of Annesley, a form with flowers some 4 inches across, with a pear-shaped, elongated, grooved seed-pod, a broad, funnel-shaped, yellow tube, and ovate-oblong segments of a canary-yellow, often somewhat twisted. The corona is bold, tubular, expanding into a reflexed, lobulated border, the lobes regular, rounded, and often more or less overlapping by one edge.

Maximus, though an old variety, is one of the very best, for the deep yellow colour of its twisted segments, and the very deeply-lobed and reflexed edge to the corona.

M. J. Berkeley is similar to the last, but with more flimsy segments.

Emperor.—A robust form, with the ovary inversely cone-shaped, not contracted at the top, as in the three preceding; tube short, greenish-yellow, flat; segments spreading, flat, broadly ovate, oblong acute, canary-yellow, with a bold tubular corona of a deeper colour, slightly reflexed and lobulate at the margin. The foliage, or "grass," of this form is very bold.

Henry Irving is very similar, but smaller in all its parts.

Golden Spur is in size and shape like *Comtesse of Annesley*, but with a more slender tube and narrower segments, the outer somewhat darker in colour than in the form previously mentioned. A very fine variety.

John Nelson.—Ovary scarcely contracted at the top; tube very short, relatively greenish; segments spreading, somewhat twisted, oblong obtuse, pale primrose; corona tubular, boldly lobed; lobes large, rounded.

John Bright.—Ovary slender, cylindrical, ovoid; tube relatively long, greenish-yellow; segments spreading, flat, narrow, oblong-acute, shorter than the broad, tubular corona, whose edge is divided into bold, oblong, slightly reflexed lobes.

Hume's Giant, a hybrid, has a short cylindrical ovary, a very long yellow tube, oblong-ovate, acute spreading segments, of a pale primrose colour, and a deeper yellow, somewhat funnel-shaped corona, with a plicate and lobed edge not reflexed.

Mr. J. G. Baker and *Mrs. J. G. Baker* have medium or small-sized flowers of similar form. Mr. Baker has nearly self-coloured flowers, with the corona reflexed, and only slightly lobed at the edge. Mrs. Baker has her crown of a deeper colour, and the edge more deeply lobed.

Bastard is one of the *maximus* type, with cylindrical ovary, narrow funnel-shaped tube, spreading, twisted, narrow segments, and a cylindrical corona, divided at the edge into six bold rounded lobes. This form was collected in Spain by Mr. Barr. It has a cylindrical ovary, star-like perianth, with narrow oblong flat segments and a straight tubular corona, divided into rounded lobes.

Hume's Concolor, a hybrid, is similar to *Hume's Giant*, but smaller in all its parts.

Mrs. H. J. Eves.—A medium-sized flower, with short, deep yellow, funnel-shaped tube; spreading oblong obtuse, rich yellow segments, shorter than the boldly-lobed cup, the edges of which are slightly reflexed.

And Righ is a fine Irish variety belonging to this section, and which flowers early.

Humbros has a small well-shaped flower, with broadly ovate canary-yellow segments, and a broadly expanded tube of a darker shade.

Among this section is a striped variety, *Regina Margherita*, in which the segments are milky-white, with a central yellow stripe. The corona is clear yellow, plicated, the margin irregularly lobed with blunt lobes.

Mrs. George Conwell (Johnston's section).—A very remarkable form, collected by Mr. Barr in Spain. The ovary is cylindrical, curved; the tube yellow, trumpet-shaped, the segments narrow, oblong, somewhat reflexed, clear yellow, corona as long as the segments, and of the same colour, tubular, cylindrical, entire. The flower has a resemblance to a large *Cyclamineus*.

Class 3 (Ajax bicolors): a group in which the segments of the corona are whitish, while the corona is rich yellow.

In this section, *Empress* takes the lead. Her Imperial Majesty has flowers 4 inches across, a short thick germ, a short broad yellowish tube, broadly oblong obtuse apiculate pale sulphur-coloured segments, and a bold clear yellow corona, dividing at the spreading border into shallow broad rounded lobes.

Horsfieldi is very similar to *Empress*, but rather smaller and with narrower segments, flushed with yellow in the centre. Both are very fine forms.

Harrison Weir and *Dean Herbert* again resemble *Horsfieldi*, but have smaller flowers, the segments channelled (not flat). As they lie on the table before us, after having been gathered some days, we can detect little or no difference, but no doubt on this ground the variations are more apparent.

Daniel Dewar also belongs here. It has a narrower and more slender ovary, and the segments are flushed at the base with deep yellow.

Class 4 (Ajax, white or pale sulphur).

F. W. Burbidge has the largest flowers of this class, at least as far as our material goes. The ovary is oblong ovoid, the tube very long, relatively funnel-shaped, yellowish; segments narrow oblong acute, twisted, as long as the cylindrical tube, pale sulphur coloured, which has a reflexed border divided into rounded lobes.

Mrs. F. W. Burbidge is similar to the preceding, but the tube and segments are broader, and the crown shorter and broader.

Albicans is very like *F. W. Burbidge*, especially in its long corona, which, however, is paler in colour and more slender.

Equisite is a large flower with yellowish tube, oblong twisted segments, and bold corona, with a reflexed irregularly-lobed border.

Cernuus, *Tortuosus*, *Colleen Dawn*, and *W. Goldring*, are all similar, showing minor variations in the colour and lobing of the corona. They are all elegant and differ one from the other in the time of flowering.

Duchess of Cornwall apparently belongs to this section, but the flowers are not reflexed, and the colour, both of the segments and of the corona, is a pale lemon yellow of great delicacy.

Classes 5, 6 and 8 partly:—

The peerless *Dafoedil*, *N. incomparabilis*, is taken by Baker to be a wild species, having the cup about half the length of the segments. It is native of Spain and South-western France, and is the parent of innumerable seedling forms and hybrids. Herbert was of opinion that the peerless one is itself a hybrid between *N. pseudo-Narcissus* (*Dafoedil*) and the poet's *Narcissus*, he, as well as others, having raised a form indistinguishable from the wild form of *incomparabilis*. As to the origin of the *Leeds* group, nothing is known for certain; Mr. Barr, however, inclines to the opinion that *poeticus* and *cernuus* were the parents of this section, while *poeticus* and *incomparabilis* furnished the *Barri* group. The *Bernardi* group is yielded by the combination of *variformis* and *poeticus*.

Even with the specimens before us, we cannot profess to be able to refer them all with certainty to their appropriate sections. The true *incomparabilis* section has the corona large in proportion to the segments; the *Barri* forms have the corona small in proportion to the segments; the *Duckhousei* set have the coronas as long as the segments, or nearly so. The best course open to us seems to be not to attempt to follow the schedule entirely, but to throw the specimens together into two main groups—(1) those having yellow segments, with yellow or orange cups; and (2) those having white segments, with whitish or yellow cups.

(1.) FORMS WITH YELLOW SEGMENTS AND YELLOW-ORANGE CORONA.

Sir Watkin (fig. 72) is too well known to need description. Its interesting history has lately been the subject of discussion in our columns.

Lady Watkin is of dwarfier habit, has a somewhat smaller flower, and a corona of deeper orange-yellow.

C. J. Backhouse is noted as a "good doer," and is a fine flower, with cylindrical ovary, a long cylindrical tube; spreading, star-shaped perianth, with oblong obtuse lobes; and a deep orange, funnel-shaped, lobed corona, not reflexed at the margin.

E. Hart has a sub-angular ovary, surmounted by an elongate slender tube; and spreading, oblong, apiculate, clear yellow segments; the corona broadly cup-shaped, folded, lobulate, of a rich yellow.

Splendens.—Ovary cylindrical; tube long, slender; perianth spreading; segments oblong-acute, sulphur-yellow, with a deep cup, yellow at the base, and with an orange border.

King of the Netherlands is like the two preceding, but the perianth is paler sulphur coloured, and the corona more spreading at the top, deep yellow, not orange.

Gloria Mundi has a smaller flower than the two preceding. The perianth segments are deeper yellow, and the cup a rich orange, and nearly half the length of the segments.

Antecora has a relatively short ovary, a curved tube, a large flat perianth; with spreading, narrow, oblong, sulphur-yellow segments, and a broad open cup of deeper yellow.

Cynosure is one of the favourite flowers of the day. It has a long, slender, trumpet-shaped tube, with oblong obovate pointed segments of a creamy-yellow colour; with a broad, cup-shaped, orange corona, plicated, and with a lobulate edge.

Frank Miles is a fine variety, with large flat flowers of a canary-yellow colour; with a cup-shaped, plicated corona of a deep yellow, with shallow lobes at the margin.

Beauty, a large form, with oblong ovoid sulcate ovary; curved, slender tube; spreading oblong segments sulphur-yellow, flushed with deeper yellow at the base; cup broadly funnel-shaped, plicated, divided at the margin into oblong rounded lobes.

Princess Mary, like the preceding, but with a broader and cup-shaped, deep yellow corona.

Baroness Heath, a small form with sulphur-yellow, ovate oblong segments, and a wide orange cup, one-third the length of the segments.

Barri conspicius.—A flower of medium size, with elongated, furrowed ovary, rather thick straight tube; broadly ovate, oblong acute segments; crown cup-shaped, one-fourth the length of the segments, plicated, with an orange-coloured lobed border.

Queen Sophia has a relatively short cylindrical germ, a long greenish sulcate tube, the segments oblong ovate acute, whitish, flushed with sulphur; the cup basin-shaped, rich yellow, deeply lobed and plicated half the length of the segment.

Scapularis \times , a very distinct form, with flowers of medium size; segments oblong acute, twisted, pale primrose-yellow; the corona one-third the length of the segments, broad, saucer-shaped, divided at the margin into six well-marked rounded lobes, as in odorus.

Backhousei.—(*Backhousei* \times type) seems intermediate between *incomparabilis* and *Pseudo-Narcissus*. It has an oblong ovary, funnel-shaped tube, spreading broadly; oblong segments of a pale yellow or sulphur colour; and a corona broadly tubular, lobed at the edge, canary-yellow, and of the same length as the segments.

W. Wilks (*Backhousei*) is similar, but has a darker yellow corona, more tapering at the base than in the former case.

Witley Dal (*Backhousei* section).—A medium-sized flower, with very short, ovoid, truncate ovary; tube funnel-shaped, yellow; segments spreading, oblong, ovate, obtuse, apiculate, primrose-yellow, about the same length as the broad corona, which is deep yellow, with a boldly lobed edge; lobes rounded, erect.

Duchess of Albany (*tridymus* section).—Flowers in threes, or in pairs, ovary oblong, not furrowed; tube narrow, trumpet-shaped; flowers medium-sized; segments oblong, primrose-coloured; cup cylindrical, folded two-thirds the length of the segments, rich canary-yellow, entire at the margin.

Duke of Albany belongs to the same section, and has rather larger flowers than the *Duchess*; the corona of a deeper yellow, and rather more expanded at the margin.

Princess Alice (*tridymus*), similar to the preceding; flowers small, primrose-coloured; segments oblong-acute; corona tubular, rich yellow, entire, two-thirds the length of the segments.

Odorus (the *Jonquil* type).—Very distinct in its quill-like foliage, its medium-sized fragrant flowers, clear yellow corona, half the size of the oblong segments, and of the same colour, but somewhat deeper; deeply and regularly six-lobed at the margin.

Rugulosus is very like the preceding, but has larger flowers, with broader segments, deeper, and of the same colour as the corona, which is less deeply divided than in *odorus*.

(2.) FORMS WITH WHITE OR NEARLY WHITE SEGMENTS, AND WHITE OR PALE YELLOW CORONA (*LEEDSI* \times TYPE), AND OTHERS.

Beatrice may be described as like a white *incomparabilis*, both the oblong lanceolate segments and corona being of a pure white; the corona is about half the length of the segments, tubular, cup-shaped. A very distinct and beautiful variety.

Gein is similar, but the segments are narrowed at the base, and expanded towards the top.

Mrs. Barton (*incomparabilis*).—Flower of medium size, segments oblong acute; corona trumpet-shaped, half length of the segments, white, slightly lobed at the edge.

Mariane Howard.—Segments, oblong white; corona pale sulphur coloured, spreading, lobed and folded.

Katherine Spencer.—Segments broadly oblong, apiculate, pale sulphur-coloured; cup primrose-yellow, plicated, spreading, nearly entire at the margin.

Queen Boss (*incomparabilis* section).—Segments oblong obtuse, whitish, with an expanded basin-shaped corona, half the length of the segments; clear canary-yellow, folded and lobed at the margin.

Acis (*incomparabilis* *Leedsii*).—Flower medium-

sized; segments oblong, whitish; corona spreading, tubular, half the size of the segments, folded, scarcely lobed at the margin.

Grand Duchess.—A white *Leedsii* form, remarkable for its very expanded basin-shaped corona, frilled at the edge. The corona is described as stained orange, but in the specimen before us (*hort. Barr.*) the crown is nearly white without any orange colour.

Madge Matthew.—Flower of medium size; ovary elongate, tube relatively short; segments narrow, oblong, obtuse, slightly twisted; corona white, half the length of the segments, plicated, spreading, and slightly lobed at the edge.

Duchess of Westminster (*incomparabilis* *Leedsii*).—Segments narrow oblong, somewhat acute white; corona creamy-yellow, half the length of the segments, tubular, slightly expanded at the top, border dividing into very shallow lobes.

Stella (*incomparabilis* type), flower large; ovary long, barrel-shaped tube slightly curved, greenish; segments twisted, pale sulphur-yellow, flushed with deeper yellow at the base; corona cylindrical, canary-yellow, plicate, lobulate.

Goliath is similar to the last, but considerably larger.

Nelsoni major has the ovary ovoid, surmounted by relatively short thick tube; segments spreading.

Queen Anne's Daffodil is remarkable for the regular superposition of its segments, the corona not being represented as fully described in a paper in the *Journal of the Linnean Society*.

Odorus plenus is an effective variety, in which the perianth segments and corona are both represented.

Other double *Daffodils* and their peculiarities are detailed in a paper published in these columns in 1875, April 17 and 21.

FIG. 53. NARCISSUS DOLBYI (N.). FLOWERS YELLOW.

white, oblong-acute; corona half the length of the segments, cylindrical, plicated, slightly lobed at the margin, clear canary-yellow.

Maurice de Villerois.—Flowers of medium size; segments ovate-oblong, rounded, whitish, flushed with yellow; corona half the length of the segments, tubular, slightly plicate, orange.

John Barr.—Flower of medium size; ovary cylindrical, sulcate; tube cylindrical; segments spreading, whitish; corona one-fourth of the size of the segments, cup-shaped, plicated, deep yellow.

Crown Princess.—Flower of medium size; ovary cylindrical, sulcate; tube slender, curved; segments narrow, oblong, pale fawn coloured; corona one-third the length of the segments, broadly cup-shaped, plicated, deep orange, not reflected at the margin.

General Murray.—Flower small; ovary oblong; tube greenish; segments oblong-ovate, pale fawn-coloured; corona half the length of the segments, cup-shaped, plicated, orange, slightly lobed at the edge.

Eloa Wilson.—Flower of medium size; ovary ovoid-oblong, not furrowed; perianth tube stout; segments broadly oblong acute, pale cream-coloured; corona one-third of the length of the segments; tubular, plicate, with a deep orange border.

Ellen Barr (*Burbidgei* \times group) has flowers of medium size, white, resembling poeticals; the corona a fourth the length of the segments, broadly cup-shaped, plicate crenulate at the margin.

Mary (*Burbidgei* \times group).—Flowers of medium

size; segments somewhat twisted at the base, pale cream coloured; corona one-fourth the length of the segments, basin-shaped, lobed rich yellow.

Montanus.—A form with reflexed white flowers, almost always deformed. The flowers look as if they might have originated as a cross between *cernuus* and poeticals.

Class 7 is represented by the lovely *tridymus*, fig. 75, and the curious *eyclameus*, with its narrow perianth segments reflexed.

Class 8 contains the plants of the sections *Burbidgei*, poeticals, odorus, junctifolius, and *Jonquilla*. These have mostly been dealt with under other headings, but ornatus requires mention as an early form of the poeticals greatly in request in the markets at the present time.

Class 9 is devoted to plants of the gracilis, inter-medius, and polyanthus, fig. 78, (*Tazetta*) groups.

Class 10 includes a miscellaneous collection of double *Daffodils*, from the big *Telamonius plenus*, a plant that has survived the period of neglect in many a cottage garden, and proves its right to do so by its great effectiveness.

Queen Anne's Daffodil is remarkable for the regular superposition of its segments, the corona not being represented as fully described in a paper in the *Journal of the Linnean Society*.

Odorus plenus is an effective variety, in which the perianth segments and corona are both represented.

Other double *Daffodils* and their peculiarities are detailed in a paper published in these columns in 1875, April 17 and 21.

COMPETITIVE CLASSES.

A Silver Cup presented to the Society by the Rev. W. Wilks was offered for competition by amateurs, for a collection of *Daffodils* (*Polyanthus* excluded.) There were only two entries in this class.

The Rev. W. Wilks, Shirley Vicarage, Croydon, had a collection of vigorous well grown flowers, and was awarded the cup; here Sir Watkin was most noticeable on account of its great size they were the finest blooms of this variety in the show. C. J. Backhouse, Gloria Mund, Empress, Baroness Heath, Princess Mary, Primulimus, Cressida, Horsfield, double *incomparabilis*, Orange Phoenix, Barri, conspicius, Acis, Maclean, fig. 79, Le-da, J. B. M. Camm, may be singled out for fine development, but all were large and well grown.

Mr. C. W. Cowan, Valleyfield, Penrynwick, showed a collection of greater size, but the cultivation evidenced was not of so high an order. C. J. Backhouse, Harrison Weir, Countess of Annesley, splendens, Barri conspicius, Sir Watkin, Ch. Hopper, Princess Mary, *Leedsii*, elegans, *Duchess of Westminster*, and Fairy, with several of the mosaic-like type, were the best; Mr. C. W. Cowan also had exhibits in the following classes, viz., for a Silver Medal, offered for amateurs by Messrs. Barr & Son, for fifty distinct varieties; and again for a medal offered by the same for a collection of twenty five varieties, showing similarly Sir Watkin, Maximus, and the *Leedsii*, and Barri forms, looking very bright, and was awarded the medal in each class.

MISCELLANEOUS.

Messrs. Barr & Son showed a small collection of herbaceous plants, including *Anemone fulgens* vars., *Muscari*, *Fritillarias*, and fine coloured *Narcissus*; also several *Orchids* and *Ophrys*. Messrs. R. Veitch & Son had trusses of *Rhododendron glomiflorum*, white, with crimson-brown spots; also Parma violets. Messrs. Jekyll, Munsted, Godalming, had a collection of grand varieties of *Primroses* and *Polyanthuses*, large-flowered, and with vigorous foliage. A box of a dozen splendid *Marchal Niel* Roses came from Mr. H. Shoesmith, gr. to — Hodgson, Esq., Shirley Cottage, Croydon—a grand lot of delicate fresh flowers. Mr. Miller, gr. to the Right Hon. Lord Fowley, Ruxley Lodge, Esher, sent a box of *Mushrooms*. Mr. J. T. Gilbert, Dyke House Nursery, Brighton, sent *Anemone fulgens*, very bright, single and double; and a box of *Camellia reticulata* flowers, from the original plant in the Society's Gardens, was also shown.

Captain Nelson, Col. R. Trevor Clarke, Darenty; Mr. G. Greyson, Storkie House, Leyland; Rev. A. Rawson, Fullbarrow, Windermere; and the Rev. T. H. Marsh, each contributed a few blooms to the display; and Mr. T. Ryan, gr. to the Earl of Annesley, Castlewellan, co. Down, sent a fine bunch of his seedling, Countess of Annesley, a showy early flowerer.

Representations of *Daffodils* came from Mr. C. M. Cowan, Penrynwick, and Mr. J. D. Pearson, Chil-

well Nurseries, Notts, both of whom send a collection of photographs of Daffodils with delicate gradations of light and shade, especially in the first-named; and from Professor Oliver, Kew, came a coloured representation of *Narcissus incomparabilis*, fl.-pl., drawn by E. D. Ehret, who flourished from 1708 to 1770.

NEW FORMS.

Messrs. J. Veitch & Sons, Chelsea, had, among others, a moschatus form named James Veitch. The trumpet was long, and of a pale pure cream colour—very distinct; Prodigy had a small flower, starry petals and sepals, of a primrose-yellow pointed, the trumpet nearly as long as the perianth segment—rich yellow, cylindrical, contracted at the throat; and Prime Minister, with a perianth of soft yellow; the trumpet full yellow, and expanding slightly longer than the segment of the perianth.

Among Messrs. Barr & Son's novelties were the following, all of the Ajax type:—Samson, a large, full yellow flower, the trumpet being a shade darker than the perianth—a striking variety; Wideawake, yellow trumpet, with primrose perianth, the top of the trumpet being very wide; Dante, pale primrose, with a sulphur edge to the corona. Several other forms were also contributed, but were not specially striking.

Awards were made as follows:—

MEDALS.

Gold, to Messrs. Barr & Son.
Silver-gilt Flora, to Mr. J. Walker.
Silver Flora, to Messrs. J. Veitch & Son.
Silver Banksian, to Mr. Poupart.

REGISTERED NARCISSE.

The following is a list of garden and selected varieties of Narcissus, sanctioned up to the present time by the Narcissus Committee:—

Pseudo.—Automedon, Challenger, Troilus, Achilles, Vicar of Lulworth, Golden Prince, and Ard Righ.
Major.—Henry Irving, Emperor, The Czar, Glory of Leyden, Madame de Graaff, Distinction, and Santa Maria.

Bicolor.—Empress, John Horsfield, J. B. M. Caum, Camoens, and Dean Herbert.

Moschatus.—Leda, Minnie Warren, Gladys, Niobe, and Little Nell. These varieties are now under observation.

Incomparabilis.—Sir Watkin, Mary Anderson, Lulworth, C. J. Backhouse, Princess Mary, Autocrat, Queen Bess, and Gloria Mundi.

— *Backhousei*.—William Wilks.

— *Bernardi*.—H. P. Buxton.

— *tridynus*.—A. Rawson.

— *Levdsi*.—Beatrice, Gem, Minnie Hume, Duchess of Westminster, Acis, and Madge Matthew.

— *Barri*.—Conspicuous, and Maurice de Vilmoir.

To the foregoing must be added the following, which were registered at the Conference, and making in all a total of fifty-four varieties:—From Captain Nelson, the varieties Nelson's Orange (= Nelsoni aurantius), pure white perianth segments, with an orange-red well-expanded cup; and Captain Nelson, a large-flowered canary-yellow Ajax variety, with a wide tube, and somewhat starry perianth. From Messrs. Barr & Son, the varieties P. R. Barr (Ajax), with broad, overlapping perianth segments, bright yellow, trumpet darker yellow, with an expanding edge; and intermedius Sunset, with a dense bunch of blooms, each flower being full yellow, with a bright orange-red cup; and for seedlings raised by M. de Graaff:—Lena (Ajax), moderate-sized flower, bright yellow; Samson, a large bright yellow flower, referred to above; Golden Vase, very deep yellow Ajax, moderate size; Duchess of Teck (bicolor), which recalls Empress; Madame Plum (bicolor), of fine and bright colours, a wide yellow trumpet, and narrow perianth segments; Mrs. Walter Ware (bicolor), with a short wide trumpet, smaller than Madame Plum, very broad perianth segments; and Miss White (bunch-flowered Leeds), rather small flowers, with a white perianth, and lemon-yellow cup.

Scientific Committee.

APRIL 8.—D. Morris, Esq., in the chair.

Scale on Fig Tree.—Mr. McLachlan reported that the scale on the Fig tree was a species new to Great Britain, and named *Mytilaspis fens*.

Purple Primrose.—Mr. Wilson exhibited a plant of a Primrose, a seedling from Scott Wilson, show-

ing a greater advance to a deep blue colour than has yet been made. A series of intermediate forms were also shown.

Root Galls on Poa annua.—Professor Marshall Ward showed a specimen of this grass with spiral knobs on the rootlets, due to the irritation of the cortical tissues caused by root-worms, *Heterodera radicolica*. Mr. Morris alluded to the recent publication of a report on this subject by the American Department of Agriculture.

"Fingered" Orange.—From Mr. Rivers, of Sawbridge-worth, came specimens of Oranges showing a partial dissociation of the carpels similar to the corresponding anomaly in the Citron, of which drawings were recently laid before the committee.

Cytisus Adami X.—Mr. Wilks showed a flowering shoot of *Cytisus purpureus* which had been engrafted on a seedling *Laburnum*. Professor Marshall Ward called attention to the explanation offered by Professor Strasburger, of the occurrence of the famous *Cytisus Adami* viz., that it was due to an accidental fusion of two nuclei, one from one species, one from the other.

Disorder Vines.—Mr. Blackmore sent a specimen with the following note:—"The specimen submitted is the entire upward growth of a young Gros Colmar planted in a viney border, and started into growth some two months since. About three weeks ago it was suddenly struck with this fatal complaint, having, up to that time, been strong and healthy, with richly coloured foliage. I have not examined the roots, but believe that they are quite healthy, as in fifty similar cases I have always found them to be. There are no cold draughts in the house, neither has there been any sudden fall of temperature. Other Vines close by are in luxuriant health and full growth." The specimen was referred to Prof. Marshall Ward for examination and report.

Botanical Certificates.—Awards were made on the ground of botanical interest and novelty to *Dendrobium albo-violaceum* and *Disa sagittalis*.

BIRMINGHAM SHOW.

APRIL 16 AND 17.—The tenth annual exhibition was held in the Town Hall, Birmingham, the quality of the exhibits throughout being very good. Hyacinths have always been a prominent feature here. There was a falling off in the quantity, but quality was fairly well maintained in the exhibits, and much credit is due to Mr. Cooper, jr. to Charles Showell, Esq., Edgbaston, for his two 1st prize lots of eighteen, in competition for the Society's prize as well as the extra prizes offered by Messrs. Thomson. In these two groups were fine examples of the general show favourites. An excellent display of Tulips was staged, and good Lily of the Valley, some well grown *Dielytras*, large specimen *Deutzias*, and *Spiraea japonicas* were also shown.

The Right Hon. Joseph Chamberlain, M.P., took the 1st prize for four pot Roses, with well grown, medium sized specimens, and the Azaleas—a good display—were medium sized, clean, and well flowered plants, Mr. Grice taking the 1st prize for six plants; Right Hon. Joseph Chamberlain, M.P., 2nd, for six, and 1st for three, and for a single specimen.

Azalea mollis were well represented, and were striking objects. Here, again, Mr. Cowper, jr. to the Right Hon. Joseph Chamberlain, was 1st, with five specimens.

The 1st prize lot of six *Cinerarias*, set up by Mr. W. H. Dyer, jr. to Mrs. Marigold, were well done plants, one or two of them reminding us of the old days, when the late Mr. Charles Turner, of Slough, exhibited such glorious specimens.

Sir Thomas Martineau's 1st prize lot of six stove and greenhouse plants not only deserved the position of 1st, but great praise also for admirable culture; these were *Athurium Scherzerianum*, *Clerodendron Balfourii*, *Dendrobium nobile*, *Inauiophyllum miniatum*, *Trachelospermum jasminoides*, and a well-bloomed *Hydrangea* Thomas Hogg.

Orchids were well represented by many good and rare specimens. The 1st prizes for twelve and six Orchids were awarded to the Right Hon. J. Chamberlain. Amongst them were fine specimens of *Cattleyas Lawrenceana*, *Mendelii*, and *Schroderii*; *Dendrobium crassinode* *Barberiana*, *Wardiaum*, and *Freemanii*, *Oncidium Marshallianum*, *Odontoglossum Andersonianum*, and a good specimen of *Ada aurantiaca*. The 2nd prizes in each class fell to Mr. Charles Winn, with fine lots, in which were some fine *Cypripedium villosum*, *Schroderii*, *Warner-*

ianum, and *venustum*, *Cattleya Trianae formosa*, very rich in colour; and a fine *Masdevallia Harryana*. Mr. G. H. Kenrick (W. A. Powell, gr.) also exhibited a fine lot, being 3rd for twelve, and 2nd for three, including a fine *Odontoglossum citrosum*, *Cymbidium Lowianum*, *Dendrobium thysiflorum*, and *D. Wardianum*.

Auriculas were fairly represented, in competition, amongst them being good examples of Duke of Wellington, Frank Simonite, General Neil, Robert Trail, and John Simonite. Some good alpine varieties were also staged.

The non-competing exhibits were numerous. Mr. Thomas Ware, Tottenham, sent a large collection of cut *Narcissi*, about eighty varieties.

Messrs. Dicksons (Limited), Chester, staged admirably, fifty varieties *Narcissi*.

Messrs. Cutbush & Son, Highgate Nurseries, London, sent a quantity of plants, including very fine *Cyclamens*, *Boronia heterophylla*, *Staphyllia colchica*, *Narcissi*, and *Crown Imperials*.

Messrs. Richard Smith & Co., St. John's Nursery, Worcester, set up a fine display of *Rhododendrons* and *Azalia mollis*, berried *Acubas*, *Japanese Maples*, and *Clematis*.

Messrs. Thomson, nurserymen, Birmingham, showed an artistically arranged group of plants within a circle of *Primula obconica*. The same firm also exhibited a large design of an anchor in flowers.

Messrs. Hendith & Co., Solihull Nurseries, Birmingham, set up a small but effective group, in which *Japanese Maples*, *Lilium Harrisii*, and the old hoop-cateat *Narcissus* were conspicuous; also a group of hardy *Polyanthus*, &c.

Messrs. Pope & Sons, nurserymen, Birmingham, set up a group of plants, in which were several plants of the fine double zonal *Geranium "Le Bruant"*, a group of the hardy *Primula marginata*, some very fine *Clematis*, and fancy *Pansies*.

EDINBURGH BOTANICAL.

APRIL 10.—At the meeting of the Society held this evening, there were given several microscopic demonstrations, and an interesting paper by Professor Balfour, in which it was shown that Edinburgh at one time had three small botanic gardens, which have, after nearly two centuries, resulted in the establishment of the present Royal Botanic Garden. Mr. Lindsay, the President, reported on the progress of vegetation at this garden for March, as follows:—

"During the month of March the thermometer was at or below the freezing point thirteen mornings. The total amount of frost registered for the month was 49°, as against 60° for the corresponding month last year. The lowest temperatures were indicated on the mornings of the 3rd, 20th; 9th, 24th; 15th, 28th; 24th and 31st, 27°. The day temperatures were high, the lowest being 40°, on the 9th, and the highest 64°, on the 16th.

"Rain fell on thirteen days, and snow on two days. There were frequent intervals of bright sunshine, and on the whole the month was a most favourable one.

"Vegetation generally has made rapid progress. Deciduous trees and shrubs, such as Thorns, Lilac, Horse Chestnut, Plane, and *Pyrus* are already bursting into leaf. The different varieties of flowering Currant are in full blossom. On south walls, the double-flowered Peach, *Magnolia Yulan*, and *Forstya viridissima* are flowering more profusely than they have done for many seasons. Of the forty spring flowering plants whose dates of flowering are annually recorded, the following ten came into flower, viz.:—*Scilla bifolia taurica*, on March 5; *Narcissus pumilus*, 8th; *Orobus vernus*, 9th; *Draba azoides*, 9th; *Erythronium Deus canis*, 10th; *Omphalodes verna*, 11th; *Narcissus pseudo-Narcissus*, 13th; *Corydalis solida*, 20th; *Ribes sanguineum*, 22nd; *Hyoscyamus scopolia*, 23rd.

"On the rock-garden seventy-three species and varieties came into flower during the month, being thirteen more than for last March. Amongst the most conspicuous were:—*Anemone pulsatilla*, *Corbularia rivalis*, *Dentaria eneaphylla* and *pentaphylla*, *Narcissus bicolor* and varieties, *N. incomparabilis* *gigantea*, *N. rupicola*, *Olearia Guoniensis*, *Pachystima Canbyi*, *Pulmonaria arvensis*, *Primula marginata*, *P. cashmiriana*, *Saxifraga Bursieriana* *Boydii*, *S. ciliata*, *S. imbricata*, *S. juniperina*, *Soldenella montana*, *Synthris reniformis*, *Veronica Colensoii*, *Xanthoxia apiifolia*."

Mr. Bullen sent an extract from record of tem-

perature, &c., in the Botanic Garden, Glasgow, for March.

"Frost was registered on eight nights during the month, the lowest reading being on the night of the 2nd, when 10° was recorded. The total frost was only 28°. During March last year the total was 67°.

"Although cold winds were frequently felt, they were mostly from the south and west, and as a consequence it has been comparatively mild, with a moderate rainfall, but a large proportion of dull or sunless days. Hardy vegetation is in a forward state, and neither sharp frosts nor withering winds occurred; it is likely to be a good fruit season.

"Ribes sanguinea and the Japan Quince had expanded leaves at the end of the month, while the leaves of the Balsam Poplar, common Lilac, Ekeagyas argenteus, had foliage half-developed, and which is an early date for these plants here. Hardy perennials are also early above ground."

The following exhibits were displayed:—

From the garden, cut flowers from the open air of Magnolia conspicua, double-flowered Peach, Rhododendron Thomsoni, R. ciliatum, R. campanulatum, Erythronium giganteum, E. g. roseum, L. grandiflorum.

From the Rev. J. McMintrin, a fine specimen of Primula viscosa gathered by him in Switzerland fourteen years ago.

HISTORY OF CULTIVATED NARCISSUS.

Mr. Burbidge remarked how singularly appropriate it seemed to him, this holding of a four days' tournament under the auspices of Queen Daffodil, in the time-honoured and memory-haunted precincts of the Chiswick garden—a garden visited years ago by Haworth and Herbert, Salisbury and Sabine, Lindley, Sweet, Ellacombe, and many others of the former lovers of the Narcissus.

The lecturer then pointed out that a love for these fragrant blossoms was almost as old as human history itself, and gave quotations from the Homeric "Hymn to Demeter" (i.e. 1000), and from the "Edipus at Colonus" of Sophocles, both of whom mentioned Narcissus Tazetta for its glittering beauty and fragrance nearly 3000 years ago.

Turning from poetry and speculative "guesses at truth," the lecturer next emphasized the fact that Mr. W. Flinders Petrie, the celebrated Egyptologist, had recently discovered—that is to say, in 1888—at Hawara, in Egypt, actual flowers of Narcissus Tazetta, as before alluded to, these blossoms having been deftly woven into funeral wreaths or votive garlands as long ago as the first century before the Christian era. These offerings to the honoured dead are supposed to have been made by Greek residents in Egypt, and are now preserved in the collections at Kew, where they may be seen.

After the poets of Greece, however, in chronological order, come the early Greek physicians, such as Hippocrates, and at a much later date, Galen, both of whom recommended the usage of the poisonous or narcotic roots of Narcissus for anæsthetic and medical purposes.

Theophrastus of Eresus (i.e. 374—286), described the plant, and he appears to have been the first to allude to its increase by means of seeds, which he tells us "were sometimes gathered for sowing," and he further says that the fleshy roots or bulbs were sometimes planted. As a beautiful and variable wild and garden flower in Southern and Western Europe, in North Africa, and in the East, there is no doubt but that this flower has ever been popular, but so far as English gardens are concerned, the Narcissus seems to have first become famous during, or shortly previous, to Elizabethan times, when all the greatest poets mention it; and during the same epoch, both Gerard and Parkinson, the Royal Herbalists of their day, illustrate or describe at least a hundred kinds, and of these old Gerard (1597 to 1633) especially writes that "all and every one of them"

abounded in London gardens. No doubt the common yellow Daffodil of the woods and meadows in "Merry England" had been popular as a flower for the making of festive wreaths or garlands long before exotic kinds were introduced and cultivated in gardens, since these are mentioned by Chaucer and other early English poets, just as they were by those of ancient Greece.

When the great wave of early seventeenth century culture spread over Europe, choice Narcissi were imported from Constantinople and the Levant generally, as Gerard quaintly tells us was the fact, along with other bulbous flowers, these latter including the then more attractive Tulip, and no doubt the Hyacinth as well.

Mr. Burbidge next alluded to the old Dutch paintings of garden flowers, dating from 1590 to 1650, and in which many kinds of Narcissi find portraiture. He in particular instanced one picture now to be seen in the Louvre (No. 477, viz., "Triomphe d'Amour," the figures by Zampieri, the wreath of flowers surrounding them being by Seghers; "Le Jésusite d'Anvers," this wreath containing life-size portraits of fourteen or fifteen kinds of Narcissi and of Daffodils, some of which are the rarities of to-day. Other pictures exist in the "Musée des Arts Decoratifs," in our own National Gallery, and their collections public and private, in which these flowers find a place, and even our English Cleopatra, Queen Elizabeth, seems to have been fond of them, since in a portrait of her by Zucchero, hanging in the Examination Hall of Trinity College, Dublin, there is a flower of the purple-ringed, or Poet's Narcissus, painted in a prominent position by her side.

Again, in the rare old folios and other books of the same epoch (1590 to 1650), many species and varieties, including several natural or wild hybrids, are illustrated either by wood engravings (mostly made at the then celebrated Plantin, or Plantin-Moretus press at Antwerp), or by copper-plate etchings or engravings. Especial mention was made of the works of the pre-Linnean botanists, such as L'Obel, Dodoens, L'Escluse—who was one of the first and best of European plant collectors—Jean Robin, Gerard and Parkinson.

Mr. Burbidge also alluded to some rare works, such as Sweet's *Florodivana*, the *Hortus Floridus*, of Crispian Passe, junr., *Jardin du Roy* and *Thésaurus Floræ*, and to the ill-fated book of drawings issued by the Rudbeck in 1702, the *Cuvapi Elysi*, of which only two or three copies exist, most of the issue, woodblocks, &c., having been burned in the great fire at Upsala in 1702. It was stated that the only complete copy of this last work is that in the Sheridan Library, at the Botanical Gardens, Oxford; but there is also a copy, less perfect, in the Banksian Library, British Museum, which contains all the woodcuts illustrating the Narcissi. It was also stated that portraits of two of the beautiful white Spanish Daffodils were seen by Salisbury (a noted authority on these flowers about a century ago), in the palace at Fontainebleau. They were worked in coloured silks on a fire-screen, said to have been given by Henry IV. to La Belle Gabrielle. Salisbury especially tells us in the *Transactions of the Royal Horticultural Society*, vol. i., that these representations were most natural and life-like, the legend worked beneath them being "Coquelourdes Blancs, 1598," or the year before John Gerard the Barber-Surgeon published his famous *Herbal*, which bulky as it was, gave a great impetus to the general study of botany and gardening in England for years and years after it first appeared.

Mr. Burbidge next alluded to the history of the cultivated and wild Narcissi, and to the now numerous and ever increasing garden hybrids and seedlings, as also to the men like Herbert, Leeds, Backhouse, Horsfield, Nelson, &c., who have in the main enriched our modern gardens with the most beautiful forms and phases of this flower.

A considerable and valuable portion of Mr. Burbidge's paper consisted of a chronological history of the genus from the days of Homer to those of Oscar

Wilde! In this tabulated list, mention is made under date of all the principal poets, physicians, philosophers, and botanists, who have alluded to the odour, beauty, uses, &c., of this now fashionable flower, or with whose names it has become connected.

It forms a concise index to the principal men and books, and will, when printed in the *Society's Journal*, be found handy for reference purposes from time to time.

THE WEATHER.

[By the term "accumulated temperature" is meant a figure representing the aggregate amount, as well as the duration, of the excess or defect of temperature above or below 42° Fahr. for the period named; and this combined result is explained in Day-degrees—i.e., "Day-degrees" signifying 19 continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts.—1, Scotland, N.; 2, Scotland, E.; 3, England, S. E.; 4, England, E.; 5, Midland Counties; 6, England, S.
- Principal Grazing Sc., Districts.—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending April 12, is furnished from the Meteorological Office:—

"The weather was generally cloudy and unsettled during the greater part of the week, with frequent showers of cold rain, sleet, and snow. Thunder and lightning accompanied the showers in many parts of England on the 8th. By the close of the period the conditions had become drier and finer.

"The temperature has been below the mean in all districts, the deficit ranging from 1° to 3° in the 'Grazing' districts, and from 2° to 4° in 'Wheat-producing' districts. The highest of the maxima were recorded on the 6th or 7th, when they varied from 63° in 'England, E.,' and 61° in the 'Midland Counties' and 'England, N.W.,' to 54° in 'Scotland, N.,' and 53° in the 'Channel Islands.' During the latter half of the week the daily maxima were nearly all less than 50°. The lowest of the minima, which were registered either on the 11th or 12th, ranged from 24° in 'Scotland, W.,' and 25° in 'Scotland, E.,' and 'England, N.E.,' to 29° in 'England, S.,' and 'Ireland, S.,' and to 35° in the 'Channel Isles.'

"The rainfall has been more than the mean in 'Scotland, N.,' and 'England, N.W.,' and about equal to it in 'England, E.,' and 'Ireland, N.,' in all other districts, however, the fall has been less than the normal.

"Bright sunshine shows a considerable decrease on that recorded last week, but has still been fairly prevalent in the more western parts of the kingdom. The percentage of the possible amount of duration

* Abstract of a paper read at the Narcissus Conference held at the Chiswick Gardens of the Royal Horticultural Society on April 16, 1890, by F. W. Burbidge, M.A., F.L.S., Curator of Trinity College Botanical Gardens, Dublin.

ranged from 25 in 'Scotland, N.,' and 28 in 'England, S.,' to 48 in Ireland, N., 50 in 'Ireland, S.,' and 54 in 'Scotland, W.'

MARKETS.

COVENT GARDEN, April 17.

Our market has begun to show signs of decided improvement, all classes of goods being now readily cleared, and present prices fairer all round. *James Webber, Wholesale Apple Market.*

FRUIT.—AVERAGE WHOLESALE PRICES.

Apples, 4-size ... 1 6-7 0	Melons, each ... 3 6-5 0
— Nova Scotia, 12 lb 1 2-3 0	Pine-apples, St. M. ... 2 0-8 0
Grapes, new, lb. 5 0-8 0	chaw, each ... 2 0-8 0
Lemons, per case, 12 0-20 0	Strawberries, lb. ... 2 0-6 0

VEGETABLES.—AVERAGE RETAIL PRICES.

Asparagus, English, per 100 ... 12 0-0	Mustard and Cress, punnet ... 0 4-0
Beans, French, lb. ... 2 0-0	Onions, per bunch ... 0 5-0
Beet, red, per dozen 1 0-2 0	Parsley, per bunch ... 0 6-0
Carrots, per bunch, 6 ... 2 0-0	Spinach, per bundle 0 6-0
Cauliflowers, each 0 3-0	Seakale, punnet ... 2 0-0
Celery, per bundle ... 1 6-2 0	Shallots, per lb. ... 0 6-0
Cucumbers, each ... 1 0-1 6	Spinach, per bushel ... 6 0-0
Endive, per dozen ... 2 0-0	Spruce, per bundle ... 1 6-0
Herbs, per bunch ... 0 4-0	Brussel Sprouts, per lb. 0 3-0
Leeks, per bunch ... 0 3-0	Tomatoes, per lb. ... 1 0-0
Lettuces, per dozen, 1 6-0	Turnips, per bunch ... 0 4-0
Mushrooms, punnet 1 6-0	

POTATOS.—In consequence of colder weather prices for Old Potatoes have had to advance an average of 5s. to 7s. 6d. per ton in many instances. Arrivals of New Early heavy, and late prices have been maintained. *J. R. Thomas.*

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Aralia Sieboldi, doz. 6 0-18 0	Ferns, in var., doz. 4 0-18 0
Aspidistra, doz. ... 18 0-12 0	Ficus elastica, each. 1 6-7 0
Apple plants, each 7 0-6 0	Foliage plants, var. 2 0-10 0
Azaleas, various, each 2 0-3 0	Gehortia, per doz. ... 8 0-12 0
Cineraria, per doz. 6 0-10 0	Heliotrope, per doz. 6 0-9 0
Cyclamen, dozen ... 6 0-15 0	Hyacinths, p. doz. ... 6 0-9 0
Cyperus, per dozen ... 4 0-12 0	Hydrangea, doz. ... 12 0-18 0
Dielisra, per doz. ... 9 0-12 0	Lily of the Valley, p. doz. pots ... 18 0-24 0
Dracena terminalis, per dozen ... 30 0-80 0	Marguerites, doz. ... 6 0-12 0
— viridis, per doz. 12 0-24 0	Palms, in var., each 2 6-21 0
Erica Cavendishii, per dozen ... 18 0-18 0	Pelargoniums, scar. ... 6 0-8 0
— viridis, doz. 15 0-24 0	— red, per dozen ... 6 0-24 0
Euonymus, in var., per dozen ... 6 0-18 0	Roses, various, doz. 12 0-24 0
Evergreens, in var., per dozen ... 6 0-24 0	— (Fairy), per doz. 8 0-10 0
Ericas, various, doz. 8 0-24 0	Solanums, per dozen 6 0-12 0
	Tulips, doz. pots ... 6 0-9 0

* Bedding plants in variety in boxes, and also in pots.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Abutilons, 12 buo. ... 2 0-4 0	Maiden Hair Fern, 2 buo. ... 4 0-9 0
Azaleas, doz. sprays ... 2 0-4 0	Mignonette, 12 bun. 2 0-4 0
Bouvardias, per bun. 0 8-1 0	— French, per bun. 1 6-2 0

— various, per doz. 1 0-2 0	Pelargoniums, scarlet, 12 spr. ... 0 4-0 6
Carnations, 12 blms. 1 0-2 0	— dozen sprays ... 9 0-1 0
Crocuses, 12 bun. ... 1 0-2 0	Primroses, 12 bun. ... 0 6-1 0
Cyclamens, 12 blms. 0 4-0 6	Primulas, double, 12 sprays ... 1 0-1 8
Daffodils, 12 bunches 3 0-6 0	Roses, Tea, per doz. 1 0-3 0
Eucubas, per dozen 4 0-8 0	— coloured, dozen 2 0-4 0
Gardenias, 12 blooms 2 0-6 0	— French, dozen ... 1 0-2 0
Hedychiums, 12 spr. 0 6-1 0	— red, per dozen ... 3 0-5 0
Hyacinths (French), per bunch ... 1 0-2 0	— Safrano, dozen ... 1 6-2 6
— (Dutch), in boxes, white, per box 2 0-4 0	Spirea, doz. sprays ... 0 6-1 0
— (Dutch), in boxes, various, per box ... 1 0-3 0	Stephanotis, 12 spr. 4 0-6 0
Lily of the Fr. bud. 4 0-8 0	Tulips, 12 lam. ... 1 6-2 0
Lilium, var., 12 blms. 2 0-6 0	— double, doz. blooms ... 4 0-6 0
Lily of the Valley, doz. sprays ... 0 6-1 0	— Violets, 12 bun ... 1 0-2 0
	— French, bunch ... 1 0-2 0
	— Parma, bunch ... 3 0-5 0

ORCHID-BLOOM in variety.

CORN.

Averages.—Official statement of the average price of British corn, imperial measure, for the week ending April 12.—Wheat, 28s. 3d.; Barley, 26s. 9d.; Oats, 18s. 6d. For the corresponding period in 1889.—Wheat, 28s. 11d.; Barley, 25s. 2d.; Oats, 17s. 8d.

SEEDS.

LONDON: April 16.—Messrs. John Sax & Son, seed merchants, of 37, Mark Lane, London, write that a steady sowing demand now prevails for farm seeds. Red Cloverseed is cheap and abundant. Trefoil and White are also very moderate in price. Choice Alsike is scarce. Perennial and Italian

Ryegrass sell freely on former terms. Low rates are quoted for French Safoin. Lucerne is unchanged. For Mustard and Rapeseed the tendency is upwards. Blue Peas meet an improved sale. Remarkably low quotations are current for Canaryseed. There is no alteration in Hempseed.

FRUIT AND VEGETABLES.

SPITALFIELDS: April 16.—Good supplies of fresh vegetables. Moderate supply of fruit. Large quantity of Potatoes at market. Demand very slow at bad prices. Fair demand for fresh vegetables and fruit. Prices.—English Apples, 4s. to 8s. per bushel; American Apples, 15s. 6d. to 24s. per barrel; forced Rhubarb, 1s. 3d. to 1s. 9d. per dozen bundles; natural ditto, 1s. 6d. to 3s. do.; Cabbages, 6s. to 8s. per tally; Spinach, 2s. to 3s. per bushel; Turnip-tops, 1s. to 1s. 6d. per sack; Swede-tops, 1s. to 1s. 6d.; Sprouting Broccoli, 1s. 9d. to 2s. 6d. do.; Cauliflowers, 1s. 6d. to 3s. per dozen; Seakale, 1s. 3d. to 1s. 9d. per punnet; Curly Kale, 1d. to 8d. per bushel; Greens, 3s. to 6s. per dozen bunches; Turnips, 2s. to 2s. 6d. do.; Carrots, 1s. 6d. to 2s. do.; Spring Onions, 2s. to 3s. do.; Parsley, 2s. 6d. to 3s. do.; Horseradish, 1s. to 1s. 4d. per bundle; Parsnips, 1d. to 6d. per score; Beetroot, 1d. to 8d. per dozen; Endive, 1s. 3d. to 1s. 9d. do.; Cos Lettuce, 1s. 6d. to 3s. do.; Cabbage do., 1s. to 1s. 6d. do.; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; English Onions, 11s. to 15s. per cwt.; Bordeaux do., 9s. 6d. to 11s. per case; Belgian do., 9s. to 10s. per bag of 110 lbs.; Dutch do., 9s. 6d. to 11s. do.; Carrots, 10s. to 24s. per ton. Potatoes: Magnums, 30s. to 50s. per ton; Regents, 60s. to 70s.; Champions, 10s. to 45s.; Imperators, 40. to 70s.; Beauty of Hebrons, 30s. to 45s.

NOTICES TO CORRESPONDENTS.

Owing to the large extension of our circulation, we are under the necessity of going to press at an earlier time than heretofore, and request our regular correspondents to favour us with their communications as EARLY IN THE WEEK AS POSSIBLE.

AGARICUS: H. G. S. The appearance is due to the outgrowth of a second fungus from the top of the first, in an inverted position. Such deformities are very common, but it is difficult to give any satisfactory explanation. Several similar cases have been figured in our columns from time to time.

BOOKS: Y. Garten Buch für Jedermann (Garden Manual for Everyone) is published by Parey, Berlin, price 6 mk.

BORDEAUX MIXTURE: A. Six pounds of copper sulphate, 4 lb. of lime, 50 gallons of water. Use with a spray-pump.

CELERIAC: M. B. In its early stages the cultivation of the plant is identical with that of blanched Celery. It is almost too late to have fine roots from seed sown at this date. When they are 6 inches high, plant them at 15 inches apart well enriched fat beds 4 or 5 lines on a bed; water in dry weather, keep clean with the hoe, and in August or September pull off a few of the lower-leaves, to let in the sun. They grow better in beds than in lines, and foliage shading the land and preserving its moisture better. Manure-water is a great help in producing big roots. But big roots, it must be remembered, are often hollow or cracked. Earth over on the approach of winter, or store in an open shed. In no case remove the heart-leaves, or the roots will decay.

CORRECTIONS.—In the list of Orchids exhibited by F. Wigan, Esq., at the meeting of the Royal Horticultural Society, April 8, *Cypripedium Swaniunum* was printed "suavisimum;" and in the list of medals awarded, "F. Wilson" instead of F. Wigan. The following errors occurred in the official list of medals supplied to us:—Messrs. J. James & Sons, Silver-gilt Banksian Medal, instead of Silver Banksian; and Messrs. Paul & Son, Silver-gilt Banksian, instead of Silver Banksian.

GENTIANELLA: F. W. R. The plant needs a moist situation in rather heavy soil, rendered porous by the addition of coarse sand and broken limestone. A full sun will do good, but a dry site is harmful. A few porous stones should be placed round the plant to assist in retaining moisture about it.

FENUGREEK: Sharpe & Co. This belongs to rather an extensive genus of herbaceous leguminous plants inhabiting tropical and subtropical countries. Its seeds are much used in flavouring cattle foods and condiments, and in disguising the flavour of bad hay. The English climate is unsuitable to it.

FUNGUS: E. A. Stansted. *Polyporus adustus*. **GRAPES, BUCKLAND'S SWEETWATER AND FOSTER'S SEKELING: S. W.** Neither wants much heat; the former may be planted at the part of your house which is the warmer, but the fruit must be eaten as soon as ripe, as it spoils rapidly. The latter will ripen perfectly in a cool house. Why not try a Frontignan or a Muscat of Alexandria at the warmer part of the vine?y

LAWN-MOWER: W. B. We have no practical experience of the machine that you name.

LILY OF THE VALLEY: H. R. The flowers are of poor quality, the produce perhaps of roots that were a long time out of the ground before being potted, or that were ill-grown.

"MAGGOTS": C. R. Your so-called maggots are worms, not likely to be injurious; probably they were introduced with the manure.

MELONS: J. S. The plants may have suffered from insufficient ventilation during bursts of sunshine, or from noxious fumes from tar, sulphur, and the heating apparatus. You should give details of management. There is no apparent disease present.

MUSTARD AND CRESS FOR MARKET: A. O. The old Mushroom beds you mention will not do; but the materials, if well mixed together, and then run through a screen or a coarse sieve, with some garden soil added in sufficient quantity to render it capable of retaining water without having need to apply water frequently whilst the crop is growing, would make the beds. These may be made in ainery, or other forcing-house (at work), or in frames. Make the beds about 2 feet deep at the back, and slope the surface towards the sun, taking care that the incline is not so sharp that water would run off when applied to it. Sow on the surface, and do not cover the seeds, but beat them into the soil lightly with the spade, and cover with mats until germination begins—not a moment longer. The surface should be renewed after each crop is removed.

NAMES OF FRUIT: Otley. Impossible to recognise the specimens of Apple now. Send when at their best.

NAMES OF PLANTS: F. H. C. I. *Kertia japonica*; 2, *Primula capitata*; 3, *Retinospora plumosa aurea* of gardens; 4, *Thuya (Thuopsis) dolabrata*; 5, *Picea excelsa* var. *clabranisiliana*; 6, *Elaeagnus pungens*.—S. W. Ribes coccinea.—J. B. 1, *Perystia viridissima*; 2, *Spirea prunifolia*, double flowered var.; 3, the Judaea Tree (*Cercis Siliquastrum*).—W. H. D. 2, *Tecoma capensis*.—H. May. *Erides crispum*; *Lycaste costata*.—C. L. C. *Epidendrum atropurpureum*.—*Novo Bras.* A. W., and P. R. Davidson. Next week.

NAMES OF FRUIT: Otley. Impossible to recognise the specimens of Apple now. Send when at their best.

May. *Erides crispum*; *Lycaste costata*.—C. L. C. *Epidendrum atropurpureum*.—*Novo Bras.* A. W., and P. R. Davidson. Next week.

SEAKALE: T. Hinchin. It is now late to prepare sets from the thongs of the roots—one of the best ways of getting up a stock of forcing-roots. The work should be done in December or January, and consists of cutting the small roots into pieces of 5 inches in length; the lower cut being slant, and the upper square across, so as to tell the planter which is the sprouting end of the set. These sets are put into boxes of light soil, in a cool place, and when growth commences, planted in lines 2 feet apart, and 1 foot from set to set. Seed may be sown at once, and if it be good seed, fine plants may be got in one season, but the crows must be reduced to one. Sow in drills as for sets, or sow in boxes in a cool frame, which is better, and transplant.

TOMATOES: A. M. Probably, but the specimen was smashed. Please send another, well packed.

VOLUMES OF "GARDENERS' CHRONICLE" FROM 1844: Thos. Taylor. You should advertise them in our columns.

The Best and Cheapest Fuel for Greenhouse Boilers, Stoves, and Heating Apparatus.

HENDREFORGAN ANTHRACITE SMOKELESS COAL—The UNITED ANTHRACITE COLLIERIES (Limited) supply their "Nut or Cobble Coal" (the Nut being about the size of a Walnut, and the Cobbles about the size of a man's fist), delivered in truckloads to any railway station. This coal is ABSOLUTELY SMOKELESS, and it requires much less attention than any other description of fuel, burning for twelve hours at LEAST without any supervision, and giving from five to ten degrees more heat than coke. Quotations can be had on application to the Company's Offices, 25, Abchurch Lane, London, E.C.
Quotations for London delivery can be obtained for the Northern, Western, and South-Western districts, from Messrs. G. R. CARTER AND SON, Coal Exchange, E.C.; and for the South-Eastern district, from Messrs. W. DOWELL AND CO., Coal Merchants, Greenwich, S.E.

HILL & SMITH'S BLACK VARNISH

for Preserving Ironwork, Wood, or Stone.

(Registered Trade Mark.)

An excellent substitute for oil paint, at one-third the cost. Used in all London Parks, Windsor, and Kew Gardens, and on every important estate in the Kingdom. Has stood the test of forty years' trial. Requires no mixing; can be applied cold by any ordinary labourer. Price 1s. 6d. per gallon at the manufactory, or carriage-paid to any railway station, 1s. 8d. per gallon in casks of 36, 18, or 9 gallons.

CAUTION.—Every Cask bears the above Registered Trade Mark. Beware of cheap imitations.

HILL & SMITH,
Brierley Ironworks, Dudley;
118, Queen Victoria Street, London, E.C. ;
47, Dawson Street, Dublin.

Boulton & Paul, Horticultural Builders, NORWICH.

No. 74.—THREE-QUARTER SPAN GARDEN FRAME.

The most useful of all Frames that are made, owing to the extra height and convenience for attention. They are 13 inches high at front, 24 inches high at back, and 22 inches at the angle, bolted at the corners, easily taken to pieces if required. The Lights are 2 inches thick, fitted with set-screws, and arranged to turn over, back and front, for ventilation. They are glazed with 21-oz. English sheet glass, and painted three-coats.

Testimonials.
"Shirburn Castle, January 5, 1890.
"SIR—As you requested my opinion of the houses which you erected for me some 4 years ago, I beg to inform you that I consider them a perfect success, and I have recommended them to many of my neighbours.—Yours truly (signed) MACFUSSELL."

"Horbury Castle, Lancaster, February, 1890.
"Major FOSTER has much pleasure in stating that the Ripley Castle Gardens, which were erected by Mr. Helliwell in 1864, continue to give perfect satisfaction, both to himself and his gardener."

"Estate Office, Ripley, Yorkshire, January 23, 1890.
"Sir HENRY INGHAM has much pleasure in stating that the glazing work executed by you, under your patented system, at the Ripley Castle Gardens, has been in every respect entirely satisfactory. The work has stood its 8 years' wear and tear extremely well, and has hitherto cost nothing to keep in repair."

"NEW EASY" LAWN MOWER.

HAS AN OPEN STEEL ROLLER. A man can work a 24-inch machine without assistance. The Front Roller, with simple adjustment for regulating height of cut, enables the machine to cut close to the ground, and to do fine work, besides adapting it for verge cutting. There is no easier working, no better finished, no stronger, no more-durable mower in the market.

To be obtained through all leading Ironmongers and Seedsmen, or from the Sole Licensees, CUTS 24 INCH LASS.

WANT PLACES.

PONTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in settling by Postal Order that it should be made payable to J. A. DUKY, or JOHN A. W. KICHARDS, as, unless the number of a Postal Order is given, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B. The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

WE HAVE ESTABLISHED a Complete Bureau of Registry and Information for furnishing experienced and reliable GARDENERS, FARMERS, SITE-INSPECTORS, COACHMEN, and similar assistants.—Call at or apply to—JOSEPH BRECK AND SONS, 51, 52, and 53, North Market Street, Boston, Mass., U.S.A.

B. S. WILLIAMS and SON beg to intimate that they have at present in their Nurseries and upon their Register some excellent Men, competent to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOINTNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, which the best selections for the different situations will be made.—Victoria and Parkside Nurseries, 21, Upper Holloway, N.

To Gardeners and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.

JAMES CARTER and CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 257 and 259, High Holborn, W.C.

SCOTCH GARDENERS.—I have at present several very superior MEN on my Register, whose character and ability will bear the most searching test.—JOHN DOWDIE, Seedman, 41, Princes Street, Edinburgh.

Gardeners, Foresters, Land Stewards.

R. B. LAIDLANS SONS can recommend with every confidence Scotchmen thoroughly qualified as GARDENERS, FORESTERS, or LAND STEWARDS, either for large or small establishments, and will be pleased to furnish particulars on application.—17, Fifeholm Street, Edinburgh.

HEAD GARDENERS.—At the present time I can recommend several highly respectable MEN, of known ability and first-class character. I have also several YOUNG MEN requiring situations in first-class places.—HEAD YOUNG MEN requiring situations in first-class places.—THOS. BUTCHER, Seed Merchant, Croydon.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. James' Nurseries, Worcester.

Gardeners, Foresters, and Farm Bailiffs.

LITTLE AND ALTYANTINE, The Queen's Nurseriesman, Southwick, Carlisle, invite correspondence with Landlord Proprietors, Agents, and others requiring the services of GARDENERS, FORESTERS, and FARM BAILIFFS. Their extensive business relations through the Kingdom enable them to distinguish men of good character and ability, such as they would be glad to recommend.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester, (Limited), are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application by letter and Postal Address.—DICKSONS, Chester.

GARDENER (HEAD).—C. WARREN, Gardener to Sir F. H. Rathbone, Bart., Clarendon Park, will be pleased to recommend his Foreman, W. Rayner to any Lady or Gentleman requiring the services of a good Gardener.

GARDENER (HEAD); age 30.—Mr. LOWRY, Head Gardener to the Hon. Lady de Trafford, Bart., Trafford Park, Manchester, will be pleased to recommend his Foreman, James Astle, as above. Highest references.

GARDENER (HEAD); age 33, married.—G. RYAN, Esq., J.P., Parbeck House, Swanage, will be pleased to recommend his late Gardener to anyone in want of a thorough practical man.—CALLAGHAN, 21, Titchborne Street, Edgware Road, W.

GARDENER (HEAD); age 30.—ADVERTISER is now at liberty to treat with any Lady or Gentleman requiring the services of a thoroughly good practical man. Highest references.—L. G. Gardeners' Chronicle Office, 11, Wellington Street, Strand, W.C.

GARDENER (HEAD).—Age 30, married, no family; understands Orchids, Stone and Greenhouse Plants, Vines, Peaches, Cucumbers, Melons, Flower and Kitchen Gardens. Steady man. Unexceptional character.—G. F. 1, Hartfield Crescent, Wimbledon.

GARDENER (HEAD); age 33, married.—45 will be paid to anyone procuring Advertiser a good situation, where not less than three are kept. Thoroughly practical in all branches. Excellent testimonials.—C. 4, Hudman's Road, East Dulwich, London.

HOLLOWAY'S PILLS.—Easy Digestion.—These admirable PILLS cannot be too highly appreciated for the wholesome power they exert over all disorders of the stomach, liver, bowels, and kidneys. They instantaneously relieve any morbid condition, and, in its course, dispel headache, indigestion, flatulence, and depression of spirits. It is wonderful to watch the daily improvement of the complexion, as Holloway's Pills purify the blood and restore plumpness to the face which has lost both flesh and colour. These Pills combine every excellence desirable in a domestic remedy. The most certain and beneficial results flow from the occasional use of this regulating medicine; even persons in health, or when following sedentary occupation, will find it an invaluable agent.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1890.

The Winners of every Highest Prize in all cases of competition, and they are the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by HER MOST GRACIOUS MAJESTY THE QUEEN on many occasions, HIS ROYAL HIGHNESS THE PRINCE OF WALES, THE KING OF THE BELGIANS, THE LATE EMPEROR OF THE FRENCH, THE EMPEROR OF RUSSIA, And most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "Journal of Horticulture," of June 9, says:—"MOWING MACHINES.—After a critical examination the Silver Medal was granted to the oil firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 155,000 of these Machines have been Sold since they were first introduced in the year 1856, and thousands of unsolicited Testimonials have been received, testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given. The following are their Advantages over all others:—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

SPECIAL.—A FEW TESTIMONIALS FROM OF THOUSANDS RECEIVED.

ROYAL GARDENS, WINDSOR, January 28, 1890.

To Messrs. GREEN & SON, Limited.

Dear Sirs,—In sending you the enclosed order for Lawn Mowers, I think it may be interesting to you to know that I am still using the Horse Machine you supplied in the year 1856; it is in perfect order even now, which is a proof that the workmanship is first-class, and speaks for itself. As to your "Hand Silens Messor," no Lawn Mowers could give greater satisfaction either to myself or to the men who work them—they are unequalled. During the season I have them daily in use in the Royal Gardens here, and never have the slightest trouble with them. Your machines are also the only ones I have in use at the Private Gardens, Hampton Court Palace; the Royal Lodge, Windsor Great Park; Cumberland Lodge, and the Royal Pavilion Grounds, Aldershot. I shall feel a great pleasure in recommending them to all my friends.

I remain, dear sirs, yours very truly, THOMAS JONES.

Mr. J. R. STIRLING, of the ROYAL GARDENS, BUCKINGHAM PALACE, writing under date Feb. 21, 1890, says:—"As regards the work your 14-inch Horse Machine does (which two years ago took the place of the one you supplied in '56), I may say it is kept in constant use here from February until the end of the mowing season, and continues to give the greatest satisfaction. It is the best Machine I know for good work and durability, and your "Hand Silens Messors" also excel all others. We have no other Lawn Mowers in use here, and I always recommend them to all my friends who inquire about Lawn Mowers."

Bathersden, Ashford, Kent, June 14, 1878. Gentlemen,—Your "Silens Messor" Mower, 20-inch, works splendidly. It is a most perfect machine, and beats the old 20-inch one that for so many years did my work without repairs. I recommend your machines, and never see any doing such good work and with so little power. You may refer any one to me, and I will then show them the S. M. at work, and I shall show it to all I can. I am, yours truly, Messrs. Green & Son.

Kintbury, Hungerford, April 20, 1873. Sirs,—I shall be glad of a list of your Lawn Mowing Machines. I am glad to mention that I bought one of your 14-inch machines 22 years ago. It has had hard and rough usage every year since, and only on Monday was it put quite out of use by the snapping in two of the driving wheel under the hammer. It is surprising to think of the work it has done, and done well. Yours faithfully, ALBERT T. BAZETT.

Wellingborough, February 4, 1890. To Messrs. Green & Son, Leeds. Gentlemen,—I have sent you our Lawn Mower for repairs, which please have done to it. I have used your machines for 25 years, and I find them more durable and do their work better than any other machines I have seen. I am, gentlemen, yours truly, DAVID PERCIVAL, (Gardener to W. Blott, Esq., Cottingham, Hull, February 13, 1790.) To Messrs. Green & Son, Limited, Leeds. I am instructed by Arthur Harrison, Esq., of Northgate House, Cottingham, near Hull, who has had one of your 20-inch Horse Mowers in use over 20 years, and ask whether you think it advisable to send it for repair or have a new one, for it is as you may suppose now getting worse for wear. Kindly say per return, and enclose Price List. I am, gentlemen, yours truly, JOHN BAYNTON, Ivy Bank, Broadway, Worcester, April 13, 1881.

Gentlemen,—I have fifteen or sixteen years ago, I had from you one of your 12-inch Lawn Mowers which, I may say, has from that day to the present time given perfect satisfaction, and goes as easily, and does its work as well now as it did at first. I have recommended yours as the best machine ever since. I am, yours faithfully, Messrs. Green & Son, Leeds. C. FRENCH HARTLEY.

GREEN'S PATENT "MULTUM IN PARVO" LAWN MOWER.

GREEN'S Patent LAWN TENNIS COURT MARKER.

GREEN'S PATENT GRASS EDGE CLIPPER

MY NEW DAHLIA
CATALOGUE

Is now being issued, and will be in the hands of my Patrons in a few days; and not receiving sundry orders, apply at once, when a fresh copy shall be sent. It contains—

MY NOVELTIES FOR 1890,

which are quite equal to my previous introductions, many of which are among the most popular of the day. Each section is fully represented, and every good variety will be found fully described. I have a grand collection of—

CACTUS, SINGLE, POMPONE, SHOW, FANCY, and STELLATE VARIETIES.

All are good strong plants, established in pots, and will be ready for planting the 1st week in May. This Catalogue also contains a fine collection of the—

NEW LARGE-FLOWERING CANNAS,

Having flowers almost as large as Gladiolus, of almost every shade of colour. This Catalogue also contains an abridged List of Chrysanthemums, Marguerites, Pent-tensons, single Pyrethrons, and many other popular groups for present planting.

I have issued this season the following Descriptive CATALOGUES:—Fruited Hardy Perennials, Hardy Flowers, Tree and Herbaceous Woody, Japanese and Alpine Primulas, Climbing Plants, Hardy Ferns, Chrysanthemums, Choice Flower Seeds. Any of which can still be had upon application to—

THOMAS S. WARE,
 HALE FARM NURSERIES,

THE **ENGLISH FLOWER GARDEN.**
 STYLE, POSITION AND ARRANGEMENT.

Followed by a Description of all the Best Plants for it, their Culture and Arrangement.

SOME OPINIONS of the PRESS.

Saturday Review.
 The English Flower Garden is a work of the highest quality. The illustrations are most excellent, and the text is a great help to the amateur or a treatise which forms the first part of the book. It is more than a book, it is a manual of the art of gardening.
Country Gentleman.
 The book is a most complete and complete of its kind that has appeared in the English language.
Daily Telegraph.
 A very fine and useful book. It is a most valuable work, and one that every gardener should have. The illustrations are most excellent, and the text is a great help to the amateur or a treatise which forms the first part of the book. It is more than a book, it is a manual of the art of gardening.
The Gardener.
 Rather more than a century ago a gorgeous stranger appeared in our garden, and was regarded with great surprise and admiration. It was the scarlet warrior by the name of the flower, and it was the first of its kind. It was a most valuable work, and one that every gardener should have. The illustrations are most excellent, and the text is a great help to the amateur or a treatise which forms the first part of the book. It is more than a book, it is a manual of the art of gardening.

SATURDAY, APRIL 26, 1890.

COLOURING OF GRAPES.

SOME experiments recorded by M. Laurent in a communication to the Botanical Society of Belgium are so interesting to Grape growers, that we deem it well to bring them to the notice of our readers. Light, as is well known, is essential to the formation of chlorophyll or green colouring matter, but the colour of flowers is less directly influenced by light, as, if the flower is sufficiently nourished, it may be, and often is, produced independently of it. This nourishment may be stored up, as in the bulb coats of a Hyacinth, or the bark of a Lilac, for instance, or it may be formed in the adjacent leaves shortly before the flowering period. In any case, although the colour of flowers may not be directly the result of solar light, it is indirectly. This may be shown by arresting leaf-action, placing the leaves in the dark, while the flowers are exposed to the light, or, as practised by M. Laurent, by "ringing" the base of the stalk supporting the flowers, so as to arrest the flow of nutriment to the flowers. In either case, although the flowers are exposed to the light, they are deformed and deficient in colour. The action of light in colouring fruits is well known and curious illustrations of it are afforded when an Apple, for instance, has been surrounded while growing by a net, the net-work is clearly marked on the ripe fruit, the position of the threads being marked by imperfectly coloured lines, while the interspaces to which access of light is not prevented, are brightly coloured. But while this is the rule in many cases, it is not so in all. The berries of the Berberis, of the Hawthorn, and of some black Grapes, colour as well when shaded by the foliage as in full sunlight, temperature and other conditions being equal. So that there are two sorts of colouring matter in fruit, the one directly influenced by light, the other only indirectly so, as is the case in flowers.

London: JOHN MURRAY, and of all Booksellers.

M. Laurent's experiments have been made, in the School of Horticulture at Vilvorde, on some Black Hamburg Grapes (Frankenthal). Two bunches were, when the berries were of the size of Peas, placed in cardboard boxes blackened on the outside, and allowed to remain therein till the berries were ripe, when it was found that there was no difference either in colour or flavour in the berries so treated and those on the same Vine grown in the ordinary way. To show that in this experiment the berries received an adequate food supply from the leaves and consequently coloured well, M. Laurent experimented by cutting off the food-supply, by means of the ringing process, from four bunches on the same day that the other bunches were placed in the dark boxes. Two rings of bark, each about a quarter of an inch in depth were taken from the Vine, one just above, the other just below the point whence the stalk of the bunch originated, so that the bunch was, in fact, isolated. Of the four bunches so treated two were placed in darkened boxes, two others remained exposed to the light. When the crop was ripe, the bunches which had been subjected to the double process of ringing and of removal from the light—those, in fact, in which access of food was quite prevented—remained green or only slightly coloured, deficient in size, and acid in flavour. The two bunches which had been subjected to the ringing process, but which were exposed to the light, produced berries nearly of the normal size, some reddish, others green; the flavour was acid, especially in those that remained green. These experiments were repeated during three successive years, and with the same general results, save that if the berries were allowed to get too large before the experiments were made, they coloured even after ringing and when placed in the dark, so that the experiment should in all cases be made when the berries are quite small, and contain but little nutritive matter. The colouring matter of Grapes may then be formed in the absence of light, provided a sufficient supply of nourishment be forthcoming, but if this supply be arrested, then the colour remains imperfect. The red colouring matter of Vines contains, according to Gignard, 57 per cent. of carbon, 4.8 of hydrogen, 37.8 of oxygen, corresponding to the chemical formula, $C_{14}H_{10}O_8$ —that is to say, to a body less rich in oxygen and hydrogen than the sugars, $C_{12}H_{22}O_{11}$, $C_{12}H_{22}O_{10}$. It may, therefore, be surmised that the colouring matter of grapes arise from a dehydration of glucose during the last period of maturation. If this be so, then the want of colour and sweetness in Grapes may be due to defective nutrition, due to overcropping, to imperfect exposure to light, and to shanking. Under each of these circumstances the Grapes do not receive a full supply of sugary food, and the colouring matter is diminished in proportion. M. Laurent's conclusions will be accepted by practical men, but they will regret with us that he has not apparently given sufficient attention to the influence of temperature.

FINSBURY SQUARE PAVILION.—The committee of the inhabitants of Finsbury Square have accepted a design by Messrs. Crompton & Fawkes, horticultural builders, Chelmsford, for a pavilion for the centre of the square. The building will be 24 feet by 18 feet, and about 40 feet high, cruciform, with ornamental gables facing four ways, and surmounted by an octagon lantern in which a clock with four dials will probably be placed at some future time. The base will be of red rubbed brickwork, and the sides of glass for the remainder of the height. The roof will be covered with red tiles. It is intended to open the building during the first week in June. All the details have been designed by Mr. Fawkes.

NEW OR NOTEWORTHY PLANTS.

DENDROBIUM ATROVIOLOACEUM, Rolfe, n. sp.*

This is another very distinct and pretty Dendrobium, introduced from Eastern New Guinea by Messrs. James Veitch & Sons, of Chelsea, and perhaps the handsomest of the set to which it belongs. It is allied to *D. macrophyllum*, A. Rich., often known in gardens as *D. Veitchianum*, but differing in the brighter colours and in the absence of the curious hairiness of that species. A plant of it (probably the first that has flowered in Europe) was exhibited at the meeting of the Royal Horticultural Society on April 8 last, and was awarded a Botanical Certificate by the Scientific Committee (*vide Gard. Chron.*, April 12, p. 463). The materials from which the annexed description was made are, a single pseudobulb bearing a six-flowered raceme, and a leaf from another plant. The flowers are 2 inches across, creamy-yellow, and elegantly spotted, while the lip is remarkable for its deep violet colour, in reference to which the name is given. My own impression is that the plant will improve much when it becomes established, for it must be remembered that these flowers were produced after the fatigues of a long and tedious journey, during which the plants lost their leaves. I believe Messrs. Veitch have imported a number of plants. *R. A. Rolfe.*

A SURVIVOR.

Some time since we had an opportunity of figuring, as the latest of its race, the sole tree in St. Helena of *Psidium rotundifolium*. Now we are enabled, thanks to the authorities at Kew, to illustrate a plant once common in St. Helena, but now extinct there, and only lately discovered in cultivation owing to its having been grown under an inappropriate name. *Melhanian melanoxylon* (fig. 81) is one of the many plants of the Island of St. Helena, which, according to Melliss, Morris, and Hemsley, have become extinct there. Two species of *Melhanian* were included in the flora of the island, namely, the above and *M. erythroxyloides*; they are both in cultivation at Kew, where a small plant of the first-named is now flowering in the T range. A figure of this species will be found at t. 1000 of the *Botanical Magazine* under the erroneous name of *Pentapetes erythroxyloides*. According to Melliss, who figures both species in his *Plants of St. Helena*, *M. melanoxylon* was found near the coast at moderate altitudes, where the weather-beaten stems are still found embedded in the soil. He says:—"I believe it to be now extinct. The last plant I saw was a small one growing in the garden at Dakhkan, about twenty-five years ago; but it is not there now, and I have searched the whole island over for another, but in vain." This was written fifteen years ago. The wood is known as native ebony, and it is black, very hard, heavy, and brittle. This plant once formed a considerable portion of the vegetation of the island. It forms a compact, shrubby tree, with ovate-acuminate slightly-toothed leaves, 2 inches long, dark green above, covered

* *Dendrobium atrovioleaceum*, n. sp.—Pseudobulb a little over a foot long, slender below, a inch thick above, with numerous furrows. Leaf three-floved, side lobes leathery, dark green, 5 inches long by 2½ inches broad. Raceme subterminal, erect, 3 inches long, with a few small sheathing bracts near base, six-flowered. Flowering bracts ovate, acute, 2½ inches long. Pedicels 1½ inch long, as well as peduncle and bracts of a very pale green. Flowers 2½ inches across, the segments widely spreading. Sepals ovate-lanceolate, acute, cream-yellow, with a faint suffusion of light green, and numerous dusky-brown and purple spots. Petals but otherwise similar. On the exterior of the segments the spots are more purple-brown. Lip three-lobed; side lobes narrow and broadly rounded, deep violet-purple inside, with a few radiating paler lines near margin, green outside, with a large dark violet irregular blotch on either side, and a broad band on the front margin of a brighter shade; front lobe reflexed, ovate, acute, its margin incurved, inside dark violet-purple, with narrow green margin and a few radiating lines of same colour, outside light green, with a very few dark violet spots; disc consisting of a pair of pallid raised plates joined at the base, which unite and then extend to base of front lobe as a single blunt fleshy keel. Column very short, pale greenish-white, almost suffused with crimson purple on front face.

with soft and silky white hairs. The flowers are Malva-like, 1½ inch across, white with a crimson blotch at the base of the column formed by the purple stamens and green stigma. *M. erythroxyloides* is the redwood of St. Helena, where it formed a tree 20 feet high, and bears large tubular flowers, which were white when they first expanded, changing to pink, and finally to red. This species is now rare in the island, for, according to Melliss, there were not more than seventeen or eighteen plants of it in St. Helena when he wrote. Mr. Morris, who visited this island in 1883, brought home seeds of this plant, and from these the Kew plants were raised. *W. W.*

ROSES.

UNDERGROUND ROSE BUDDING.

This interesting means of propagation is but little understood and practised by amateurs, and it is more than probable that not a few pretty successful rosarians may never have heard of it, and yet it seems reasonable to assume that if Rose buds root so freely on foster stems or branches; they may also be made to root in the ground. During the process of rooting, Rose buds need but little help whatever they may require afterwards. During the process of "taking," as the union of scion and stock is technically called by Rose growers, the stock is virtually passive. The chief aid the bud desiderates during the process of union is a moist medium and a growing temperature, and these two mechanical conditions are as easily commanded through the soil as through the tissues or sap of the plants of Roses or of Briars. Hence it ought to be as easy a matter to root Rose buds through the soil as through other plants. And it is, and yet it is not. Nor is this diverse answer so paradoxical as it seems; so very much of success or failure turns on the time of budding. The majority of those who try the rooting of Rose buds in the earth in the spring have probably failed; and yet never do Rose buds look more tempting and full of self-contained life than through February, March, and April. Branchlets, even flower-buds in embryo, are already in the buds, whose base swells out into something like a natural callus, as the embryo shoot develops itself. What an attractive and tempting condition for the skilful cultivator deftly to transfer the bud from mother Rose to mother earth.

This has been done thousands of times, with such uncertain success as hardly to invite repetition, and yet the causes of complete or partial failure are by no means obvious. They are largely hidden away under such convenient phrases as season and sap, and both, no doubt, have much to do with the failure to root Rose buds in the soil in the spring. Nevertheless, it having been done, the practical question for amateurs is whether, considering the low percentage of success, in this mode and time of propagation, it is worth the candle. An emphatic positive answer would at once be given to this question, were it not for this double answer, that Rose buds may more readily and more certainly be rooted in the earth in July, and that spring buds may more swiftly be converted into Rose bushes as scions than in the form of buds.

The first step to success, then, in this method of striking Rose cuttings in the earth is their selection at the right season. This extends from June to August, according to site, soil, climate, &c. July, as a rule, will furnish the best buds. Choose only such as would be used for the budding of Briars; manipulate them exactly in the same way, with these two very important exceptions—leave the base leaf and the half or a quarter of the wood under the bud intact; in other words, cut the Rose-shoot away under the bud as for budding, but leave the wood intact under the bark. Different propagators prefer different proportions of wood left under the bark, but all agree in cutting a half or thereabouts of the circumference of the wood away, so as to expose the edges of the bark to the soil.

Some make a point of retaining all the pith. Others of cutting right through it, and others still of

cutting it clean out, leaving about a quarter section of the wood intact. The amount of wood left is not material to success; neither does it greatly matter whether the ends of the bud section are wedge-shaped, or left nearly square, as an axe-head, but as the thin edges are of no mechanical use in this mode of bud-rooting in the soil, and may tend to an undue attenuation of vital force, more wood and bark may be left towards the end of those earth-

safety, such buds mostly remain on the rooting pans for some little time after rooting, it is customary to use an inch or so of the usual mixture of loam, peat, leaf-mould, and sand over the drainage, and to surface all with another inch of clean silver-sand, and this, by watering and compression, should be made as firm and hard as practicable. A day or more after the final matting, the pans or pots will be in the best condition for use.

soon as the pan or pot is filled, and cover at once with a bell-glass, and place the pots in a close pit or frame, and shade from bright sunshine. Care must be taken not to overwater the buds. If the pots or pans are sufficiently moist, a swill overhead may suffice; or if more water is given, the buds should be left for a hour or so, for the surface of the leaves to become nearly dry before the bell-glass is put on. The best and safest mode is to have the rooting material in perfect condition as to moisture before inserting the eyes, as any excess of watering overhead after insertion is apt to displace the eyes as well as to saturate or sour the compost.

The time of rooting depends greatly on the degree of heat applied. A close frame, pit, or house will provide sufficient warmth under skilful management. But a slight addition of bottom and surface heat will hasten the rooting process. The latter, however, must not be carried to excess, nor greatly exceed from 60° to 70° at the utmost.

Good culture consists in preserving the leaves on the buds until the latter are callused or rooted. Little water or air will be needed until this takes place; but the leaves must on no account be allowed to flag for lack of water or any excess of sunshine until roots and fruit growths appear. Then remove the bell glasses, tentatively at night at first, then for a few hours during sunshine, and finally wholly, so soon as the buds have rooted into plants.

Caution should be exercised as to potting the buds off singly, or failure may treat swiftly on the heels of success. Some pot Rose buds off singly so soon as callused. This plan is safe and good if wisely followed; the wisdom chiefly consisting in placing the buds in bottom heat, and getting them to push forth roots. But where it is resolved to proceed more slowly, no buds should be shifted until well furnished with roots. Some even prefer wintering their earth buds in the pots or pans in which they were rooted, and this is doubtless the safest course to pursue unless the single plants are well rooted before winter. For much soil and few roots in a Rose or any other flower pot is the surest possible preparation for a good and safe passage through our changeable winter. *Rosa*.

FIG. 81 — MELIANTHA MELANOXYLON, THE BARKWOOD OF ST. HELENA, NOW EXTINCT. (SEE P. 512.)

buds than in ordinary buds. By cutting these ends square down, more bark will also be placed in contact with the soil, than if the bud sections were "slivered off."

Though the character and manipulation of earth Rose buds have been described first, yet suitable preparation for the reception of the buds must precede their propagation. Well-drained shallow pans, the drainage covered with coena fibre refuse or leaf-mould filled or surfaced with clean silver-sand, form as good a striking medium for Rose buds as any other compost. Though for convenience, as well as

The moment the buds are manipulated into shape insert them slightly in the sand, the surface of the bark being barely covered; the growing ends of the buds may incline a little higher than the base ends. This is easily managed by beginning at one side of the pan, and pointing all the buds in one direction. This simple detail also imparts greater stability to the buds, a point of considerable importance towards rendering them immovable during their first stages.

The buds may be placed as closely together as their leaves will permit, sprinkle lightly overhead as

MR. MARRIOTT'S GARDEN, COVENTRY.

MR. ALDERMAN JAMES MARRIOTT'S specimen stove and greenhouse plants are well-known at the flower shows of Shrewsbury, Reading, and other places, and his collection of Orchids has a name in the Midlands. About five minutes walk from the Coventry station is the Grosvenor Road, and here is Mr. Marriott's garden, which is about an acre in extent, and mostly covered with glass. The Orchids are numerous, many of them very fine specimens. There was, at the time of my visit, a plant of *Lycaste Skinneri* alba with three fine blooms, averaging 6½ inches across a very fine variety indeed, with a bright lemon lip. Another gem in flower was *Dendrobium Brynerianum*, also *Aerides crassifolium* in a hanging basket, bright rosy-pink, and very fragrant. *Odontoglossum maculatum* was represented in several varieties, two being of great beauty. *Cypripedium bellatulum* and *C. niveum* were noted in bloom. *Cedogyne ocellata maxima* is another little gem. Other species in flower were *Cymbidium Lowianum*, a grand pyramidal mass of *Dendrobium Devonianum* in a hanging pan, *Dendrobium Wardianum*; a fine variety of *Dendrobium nobile*, with an intense rich deep violet spot on the lip; fine specimens of *Oncidium sphaecelatum*, *Cypripedium villosum*, and *Laelia anceps alba*, but this last not in bloom. Mr. Finch, an Orchid grower, manages his plants intelligently and well, and has a name as a cultivator of specimen exhibition plants.

There are now in the houses a number of plants which have been at rest and are now preparing for their round of work at the coming flower shows—*Dipladenias*, *Crotons*, *Ixoras*—amongst them a grand *I. Williamsii*; *Allamandas*, *Francisae*, *Rondeletias*, and others. A specimen *Cleiva miniata*

has furnished sixty-two fine heads of flowers, and some are now on the plant. Anthuriums are well done here, and an *A. Rothschildianum* now in flower is very beautiful, so distinct and exquisitely spotted. As cut flowers are wanted to so great an extent here, Mr. Finch was strongly recommended to grow *Psychotria jasminiflora*, a plant that is worthy of the attention of market growers, as it produces freely its corymbs of waxy, white jasmine-like flowers.

One remarkable feature in the Grosvenor Road is a low span-roofed house, 46 feet long and 12 feet wide, for growing *Ericas*, and here are to be found many veteran plants of leading species, and young plants in good condition coming on. Grapes and Melon-growing, as well as plant cultivation, are good all round. *W. D.*

VAGARIES OF VARIATION, WITH SPECIAL REFERENCE TO BRITISH FERNS.

(Continued from p. 480.)

In *Polystichum angulare* many of the markedly abnormal forms revert temporarily to the normal if the plant be shifted or allowed to get out of condition, and sometimes even lose their abnormal character permanently. Such plants, however, even at their best, generally show traces of irregularity, and hence are not quite parallel cases to the *Lastrea* above cited, which, large as it was, was perfect in every way.

In 1888 I found at Clovelly a very remarkable example of extreme variation in an otherwise normal plant of *P. angulare*, one frond of which was divided near the base into three, each division dividing again and again until the frond formed a broad triangular fan of no less than 15 branches, several of the extreme points being furthermore tipped with finely fringed tassels. The remaining fronds were quite normal, save that one was split near the apex. On taking up the plant, the *debris* of a solitary fanshaped frond of similar widely abnormal character was found among the fronds of the previous season. Though it was not ascertained that the two abnormal fronds sprang from the same part of the caudex, there seems a probability in this case that one portion of the crown varied from the rest, in which case should the crown divide by simple fissure, or a bud at the base of the abnormal frond produce an offset, a constant thorough variety might thus be produced, or spores from the abnormal frond—which in this case was barren—might yield a like result. The recurrence of such a very abnormal frond is the interesting feature here, seeming to indicate a transition state of some sort.

On the opposite side of the road, and within 50 yards of this plant, I espied another *P. angulare* bearing a frond with a neatly tasselled apex, and pinnæ dilated at their tips; a second frond showed this latter feature only, accompanied by a few depauperate pinnæ. On taking up this plant, I found it to be unmistakably an offset of a large coarse growing plant with truncate fronds, but otherwise normal. Under cultivation the offset produced normal fronds with one exception, which bore a much divided apical tassel. The parent stock, on the other hand, threw up non-truncate fronds with abnormally long basal pinnæ, in one frond indeed these were equal in size to the rest of the much reduced frond, forming a sort of trident. Here we obviously have a struggle between normal and abnormal elements which, through spores or buds, might produce strongly marked and possibly constant varieties.

On two occasions also, it has been my lot to find absolutely distinct varieties growing side by side. In the one case a dwarf depauperate, but constant form of the rarely sportive *Lastrea montana*, its immediate neighbour being a robust form of *Blechnum spicatum*, with confluent and cruciate pinnæ towards the apex of all the fronds, many of which were moreover once divided at the tips, the divisions spreading out at right angles to the rachis. Both these retain

their characters under cultivation. In the other case I gathered from a wall-top near Minehead two forms of *Polypodium vulgare*, so closely associated, that though the rhizomes were disconnected, I concluded that I had broken a single plant of irregular type into two. Under cultivation, however, one has proved to be a fine symmetrical, acute form, with long markedly serrate pinnæ, and a sharply pointed apex to every frond; in the other, however, all the fronds are abruptly truncate, the pinnæ are obtuse, and only crenate, except those next the truncation, which are abnormally long and so deeply cut as to be almost bipinnatifid, in short, they form two unmistakably distinct forms.

Recurring to the theme of reversion, there are several curious instances of intermittent partial reversion which merit notice. That beautiful variety of *Athyrium filix femina*, viz., *kalothrix*, was a sport from a true plumose form, and most if not all the plants I have possessed produce here and there, sometimes an entire frond of the parental type, but more frequently it is only a pinna or two, or even a pinnule, which appears so affected; while if a plant be long undisturbed, it may cease to revert altogether. A batch of seedlings raised by myself gave several entire reversions to the plumose type, and Messrs. Stansfield of Sale report the same experience. One of my seedlings afforded me, moreover, a curious instance of temporary crested, after developing into a small plant of true *kalothrix* type, it was potted up and accidentally allowed to get just dry during the winter and spring. Early in the summer it was soaked, with a forlorn hope of resuscitation. It then threw up a small but very finely crested frond, bearing an unmistakably wide fan-shaped tassel of numerous points; the next fronds followed suit, but less markedly, and by the time the fourth or fifth fronds arose it had recovered gradually its normal outline, which it has since maintained. Several other seedlings of the same batch under starved conditions, bore irregular ramose fronds, but immediately they received special care as novelties, the eccentricity vanished. Here, obviously, we have crested resulting from uncongenial conditions, and the question arises whether spores produced under like circumstances might not occasionally yield permanent variations. I am not aware, however, of any evidence supporting this idea.

As a curious coincidence in very eccentric vagaries, I may mention that some years back I found near Wigtown, N.B., a form of *Athyrium*, in which the leafy portion of the two or three pinnules next the midribs of the fronds was symmetrically absent, the rachides only remaining as little thorns, so that there was a tapering longitudinal space down the centre of each frond, giving it a very curious appearance. Last year I received from Mr. Phillips, of Belfast, an Irish find of his with precisely the same character; the pinnæ, however, had also a space down their centres, due to a slight depauperation of the pinnules adjacent to their midribs. It is worthy of remark that the two finds were so very distinct, apart from the main characteristic described, that a common origin was extremely unlikely, independent of the consideration of the distance the spores would in such case have had to travel.

In connection with the subtle influences which lead to these vagaries, it is a singular fact that, when hybridisation is effected by sowing the spores of crested and non-crested forms together, it occasionally happens that the crested character is transmitted purely by itself, the result of the cross being the true frond type of the one parent, plus the crested of the other, though the second parent may have fronds widely abnormal otherwise.

I may also appropriately chronicle here two singular combinations of the effect of crossing between Ferns, one parent being subject to partial reversion. Mr. Clapham was successful in crossing two very marked varieties of *Polypodium vulgare* viz., var. *elegantissimum*, a very finely divided form, subject to piecemeal reversion like *kalothrix* and var. *bifido cristatum*, a very fine but somewhat narrow crested form. The result was the transference of the

cresting to *elegantissimum*, with the curious additional effect that while the tendency to piecemeal reversion persists, true fronds of *bifido cristatum* are thrown up instead of normal ones. A more absolute proof of the joint parentage could not be imagined. A composite frond of this lies before me as I write. A kindred case is recorded by Colonel A. M. Jones in connection with a cross effected by Mr. Stansfield between a fine plumose form of *Athyrium* and an irregular depauperate crested form known as *Craigii*, the result being a plumose *Craigii* which, to remove all doubts as to its pedigree, produced subsequently a frond true to the plumose parent, but crested, not a taint of the *Craigii* character other than this, appearing.

I am now, however, entering into the domain of other experiences than my own, merely, however, to indicate lines of research which may, if persistently followed, yield results sufficiently coherent to build a theory upon. What is needed, is some definite centre where reports upon the phenomena observed could be collated. At present the specialists are sporadic, and their knowledge mainly confined to themselves. Occasionally a short article appears, now in one and now in another of the horticultural journals, and from time to time papers are read and even published by kindred societies, but that is not enough, and I trust that the re-awakening interest in this important branch of native horticulture may lead to some special organisation there ament being arranged at the forthcoming Fern Convention to be held in July next by the Royal Horticultural Society. *Chas. T. Dwyer, F.L.S., Fernholme, Forest Gate, Essex.*

HYBRID ODONTOGLOSSUMS.

There is no genus of the great Orchidean family is at once more popular with the horticulturist and more perplexing to the botanist than *Odontoglossum*. So attractive are many of the species, so floriferous, and so easily cultivated, that most of the districts in which they are known to grow have been ransacked, and the plants sent home in hundreds of thousands to enrich our collections. Under ordinary circumstances the result of this activity would have been to increase our knowledge of the genus very materially, if not to enable us to form some idea of the number, variability, and distribution of the species of which it consists. So far from this being the case, however, the number of intermediate forms which are constantly appearing tend rather to obscure the limits of species formerly considered distinct, and the nomenclature of the genus is in a hopeless and bewildering state of confusion. Some of these intermediate forms are undoubtedly natural hybrids, but it is probable that others are pure varieties, for some of the species have proved polymorphic to a degree quite unsuspected a few years ago. In a few cases the gaps between otherwise distinct species seem to be so completely bridged over by these intermediate forms that the Messrs. Veitch, in their *Manual of Orchidaceous Plants*, speak of them as "confluent in series," on account of the difficulty of deciding where the partition wall is to be set up between them. In these cases they have placed acknowledged hybrids as varieties of the species they most nearly resemble. "This plan," they remark, "is by no means free from objection; but it has at least the advantage of grouping together a number of allied forms, which, if described under separate names, would leave the acknowledged confusion much where it was."

It has been my misfortune of late to have to determine a considerable number of these doubtful plants, and I have found the task by no means an easy one. I do not, however, regret the circumstance—quite the reverse; for it seems to me that the only way to get a clear idea of the genus is to get together as complete a series of the different forms as possible, whether varieties or hybrids, and then compare them side by side. The accumulation of such a series is necessarily a work of time. The most complete one in existence is, unfortunately, not

available for reference for the next quarter of a century, or nearly, and the only available plan is to provide an efficient substitute. The Kew collection contains a fair proportion of the hybrid forms, in addition to most of the species, but is wanting in some of those described by Reichenbach. Most of them exist in gardens, though a few are rather rare, in consequence of which they come to hand rather slowly.

It repeatedly going through the material at hand, two or three things have presented themselves very forcibly to my mind. The first is, that in the majority of cases it is possible to separate the undoubted species from those which may, with a greater or less degree of probability, be assumed to be of hybrid origin. It is fortunate that such is the case, for I believe it is the first real step towards the solution of the problem. In those cases where the forms appear confluent, it may hereafter be possible to effect the same separation between them. It may not be easy to lay down any absolute rules by which natural hybrids can be separated from genuine species, but the two are so essentially distinct in their origin that a very few considerations will serve to make the matter clear.

Species, of whatever kind, have always a definite geographical area, over which the individuals which compose it are distributed, more or less continuously or disconnectedly according to circumstances. Taking this area as a whole, the individuals are generally very numerous, but everywhere they bear so strong a resemblance to each other that they can generally be easily recognised as individuals of the same species. Of course, a variable species may exist in different areas as what are called geographical varieties, and, at the present day, no apology is needed for saying that these are incipient species. Two or more species may be found growing together in one spot, but even when this is the case the boundaries of their individual geographical areas are hardly ever continuous; that is to say, there are other spots where the same species grow separately. In fact, there are good grounds for believing that this is almost invariably true of closely allied species. Even where they grow together, there are equally strong reasons for believing that they originated separately, but were afterwards disseminated from their original birthplace, and thus accidentally brought together. These considerations help us materially to understand the phenomena of natural hybridism.

Natural hybrids only originate where two or normal species grow in sufficient proximity to each other for the pollen to be carried from the one to the other. In most cases they are found growing with the parent species, though this is not always the case; for the seeds may sometimes be carried away to some distance, though with Orchids I think we have very little evidence of its taking place on any extensive scale. These hybrids are generally so intermediate in character that their parentage may very often be guessed by anyone well acquainted with the characters of the parent species—in fact, it may often be said, as in the case of artificial hybrids of known parentage that they bear the evidence of their origin in their faces. Another fact respecting them is that, compared with the parent species, they are very rare. There are a few cases where, taken in the aggregate, the individuals are numerous, because the same cross has been effected over and over again. In such cases, however, there is usually a considerable range of variation. To quote Messrs. Veitch:—"From the first it has been observed of these natural hybrids, that it is an extremely rare occurrence for any two appearing in different importations to be identical, although apparently derived from the same two species, and sometimes sufficiently alike to come under the same name." One other consideration which should not be overlooked is, the possibility that some of these male forms may be themselves derived from hybrid parents, as is the case with certain artificial hybrids.

"These hybrids are highly deserving of attentive study, for owing to the still very imperfect know-

ledge of the distributional limits of the species of *Odontoglossum*, and the still more imperfect knowledge we possess of the insect life of the region, it is at present hopeless to attempt any satisfactory explanation of their origin, or from the data already accumulated to deduce any general law respecting them." These interesting words are cited from Messrs. Veitch's work before mentioned. In future papers I hope to be able to analyse the materials already accumulated, with a view of accelerating future progress. Meantime, a few flowers of any of the following would be very gratefully received, or indeed of anything which would in any way aid in elucidating a difficult but very interesting problem.

acuminatissimum	hinnus	Measuresarum
baplicanthum	Horsmanni	multis
brachypterum	Jenningianum	Pollitianum
Bra-sia	Leubum	prionostolium
cheirotroma	Lobatum	radiatum
deltoglossum	Leucum	Schroderianum
di-ranophorum	ligulare	Scotti
facetum	microphyllum	stelliformis
ferazineum	Murrottianum	tentaculatum
histromicum	Museolanum	Vulstkeanum

(To be continued.)

VEGETABLES.

BROCCOLI.

In a general way, Broccoli seed, in my opinion, is sown too early, particularly the late varieties; also too thickly. Towards the end of the present month scatter the seed thinly on ground that has been made rather firm, that is not over rich, and has been made fine. The seed may just be covered, and in most gardens it must be protected from birds by spreading a fish-net over the beds, supporting it with forked pegs, or by rolling the seed damped in milk in red-lead powder. To have short-legged, hard-stemmed Broccoli, the seedlings should not get crowded and drawn, but should be planted out when they are large enough to handle. I find that the best way of managing, so as not to waste space, is to put Broccoli in rows 4 feet apart, and have Potatoes between the rows, as then both crops are benefited from the full sunlight thus obtained. Although a rich soil may produce the best heads, when the plants have the luck to live through the winter, it does not favour hardness.

The best place for late Broccoli is an open field, as they will stand without injury whilst garden plants have been killed outright, or much weakened by frost. For early work, or first cutting in the autumn, the finest Broccoli is Veitch's Self-Protecting, and it is enough to say of this that it is in all respects equal to the well-known Autumn Giant Cauliflower, and of which it seems to be a late variety. To succeed this, Snow's Winter White, if it can be had true, is the most trustworthy, as the heads are well-protected and very compact and white, and it grows of suitable size for table use. To follow on after this, none that I have tried are equal to Veitch's Spring White—a Broccoli perfect in shape, of medium size, and white. For late use, Model is the type of what a good Broccoli should be, and it is, therefore, appropriately named, and it has desirable hardness as well. Lauder's Goshen and Late Queen are both excellent sorts, and any one growing the above-named will have the cream of Broccolis; but, in addition, every person should plant some Early and Late Purple Sprouting, an exceedingly useful vegetable, of delicate flavour, *J. Sheppard*.

Hartland's April Queen is certainly the best variety grown in the south of Ireland. It is of excellent quality, and comes into use when other vegetables are getting scarce, and the heads are well protected and white as any Cauliflower. For market purposes it cannot be beaten. *P. C.*

We have been cutting, and are cutting daily, some splendid heads of Sutton's Late White Broccoli, which seems to withstand frost better than any other. Leamington Dwarf is also good, and 95 per cent. of it has stood well the trials of the past winter.

Veitch's Model is likewise a good Broccoli, of which we are now cutting handsome heads. These three are very superior over all hardy varieties, and of good quality. *W. A. Cook.*

RATING OF NURSERIES AND MARKET GARDENS.

The Bill to amend the Law relating to the Rating of Machinery, which was read a second time this week in the House of Commons, is one which affects the nursery trade to a greater extent than any other measure which has been introduced since the Income-tax Act of 1842, which contains special provisions relating to nurserymen and market gardeners. When I say that it affects the trade, I mean that it may be made to affect it, if proper steps are taken for that purpose. As the Bill is drafted, it does not comprise the trade within its scope, although the principle of the Bill is such as to make it easily applicable thereto.

In order that this may be understood, will you permit me to remind your readers that in June 1887, a meeting of the trade was called by me for the purpose of taking into consideration the inequality which existed in the assessments to the poor-rate of nurseries and market gardens, and for the purpose of endeavouring to arrive at a proper basis on which such assessments should be made. As a result of the meeting, the opinion of an eminent counsel was taken with a view to ascertain the existing law on the subject. His opinion is embodied in the report of my association for the year 1889, and is to the effect that greenhouses belonging to nurserymen and market gardeners are trade fixtures, that as such they cannot be rated, but that they must be taken into account as enhancing the value of the land on which they are erected in arriving at the rateable value of the land. In view of this opinion (in which the various decisions of the Courts on the subject were cited), it was thought inadvisable to take up a test case which would have the effect of throwing away money for no useful purpose. When this decision became known, a lengthy correspondence took place between a member of the trade and myself, the object on his part being to convince me that the long list of decisions cited by counsel in his opinion, could be reversed; but I was not convinced. By a curious coincidence, on the very day the Bill before mentioned was introduced, a case in point came before the Queen's Bench, and the cases cited in the opinion of counsel were sought to be distinguished, but without avail, and it was decided again that trade fixtures must be taken into account, as enhancing the rateable value of the property. Mr. Justice Grantham, in the course of his judgment, said it was difficult to see how, in fact, that was not a rating of chattels, but the cases showed that a thing which would otherwise be considered a chattel might enhance the value of land for rating purposes; there is therefore now no question as to what the law on the subject is, and that case fully justifies the decision come to by my committee.

The remedy, however, which is sought for can be found in the Bill already referred to. Its preamble recites that "questions have from time to time arisen as to how far machinery is to be taken into consideration in estimating the rateable value of the premises in which any trade, business, or manufacture is carried on, and it is expedient to amend the law relating thereto;" and by Section 1 it is provided that, "in estimating for the purpose of assessment to the poor-rate, county-rate, borough-rate, or any other rate leviable upon property rateable to the relief of the poor, the rateable value of any tenement or premises occupied for any trade, business, or manufacturing purposes, the annual value of the machinery in this section specified on any such tenement or premises shall be taken into consideration—that is to say, water-wheels, &c." By Section 2 it is provided that, "save as in the last section provided, no machinery, whether attached to the tenement or premises or not, shall be taken into consideration in estimating such rateable value."

It will be seen that the governing word, both in the title and body of the Bill, is "machinery." Now, whether this word alone would include glass erections is very doubtful indeed, and it appears to me that this is an opportunity not to be lost of getting such words inserted in the Bill in Committee as would place the question beyond all doubt. The manufacturing interest is well represented in the House, but the nursery trade, as far as I know, wholly unrepresented, and *prima facie* the manufacturing interest alone is referred to in the Bill. Those of your readers who read the debate on the Bill will remember that the main argument against it was, that the alteration the law proposed would shift the rates from the wealthy class of manufacturers to the classes of industry less capable of bearing the already too heavy burden of taxation. This very argument will support the extension of the scope of the Bill as I propose, by relieving the trade to an enormous extent, and thus tend to average the distribution of taxation.

It is for the trade to say whether they desire the matter to be taken up, and I shall be happy to receive communications from them, either direct, or through your columns, on the subject. Meanwhile, I am in communication with the promoters of the Bill, as it is a matter that will allow of no delay. I trust that the importance of the matter will be a sufficient excuse for my trespassing at such length on your space. *F. C. Goodchild, Secretary, Nursery and Seed Trade Association, Limited, 25, Old Jewry, E.C.*

PHALENOPSIS IN THE PHILIPPINES.

I READ the account of the distribution of the section Euphalanopsis in the Philippine Islands, given by Mr. C. Roebelen, at p. 459, with very great interest, partly on account of the subject itself, and partly because of the light it throws on the affinities of the Philippine flora with that of the Malayan Archipelago, in both of which I am particularly interested. I fully agree that details relating to the surroundings of a new species, and its nearest allied neighbours, are almost as necessary as the description of the plant itself, and therefore it is very gratifying to find such information forthcoming on the distribution of a group of plants of such commercial value. There are several other very perplexing groups on which similar information is much needed, and let us hope it will soon be forthcoming.

To return to the Phalenopsis. One of the first points which strikes me as particularly interesting is the presence of *P. grandiflora* in the island of Palawan. Hitherto we have generally believed that this species was absent from the Philippines, being there replaced by *P. amabilis* (I use this name in the sense it is generally used in gardens, though the name properly belongs to the Malayan species). I should much like to know whether the remark that "*P. amabilis* grows all over the Philippine Islands" is intended to apply also to Palawan, for it would be very curious to find that both grow in the same island. I am not so much surprised at the occurrence of *P. grandiflora* in Palawan as I should have been a year or two ago, for in working up a few plants from this island, and the small island of Balabac (between it and Borneo), there appeared traces of affinity with Borneo rather than with Luzon, and in my paper on the *Flora of the Philippine Islands* (*Journ. Linn. Soc.*, xxi., pp. 283-316), written at an earlier date, I pointed out that the deepest channel which traversed the submerged bank which connects these two islands was the Mindoro Straits, north of Palawan; so that it seems quite possible the latter island may have remained in connection with Borneo long after it had been separated from Luzon. A few notes on the Orchids of Palawan would be very interesting.

The Sulu Archipelago flora seems more allied to the Philippine one. There is Phalenopsis Mariae in the main island of Sulu, and in Mindanao, and Mr. Roebelen mentions *P. amabilis* in Tawi-tawi. The Sulu plants I have had to work up appeared more

Philippine than Bornean, while the deepest channel which traverses the submerged bank running between Mindanao and Borneo is close to the latter island south of Tawi-tawi. Thus we should expect to find the Sulu flora rather an extension of the Philippine than the Bornean one.

The distribution of *Phalenopsis grandiflora* is very interesting. (The section Euphalanopsis is exclusively Philippine, with the exception of this species and *P. gloriosa*, which I believe is a local variety of the same; at least it has a similar narrow front lobe to the lip, though it differs in colour.) It occurs in Java and some small adjacent islets, various parts of Borneo, Palawan (according to Mr. Roebelen), Celebes, Buru, Amboyna, and Timor Laut, in the Moluccas. Thus its known area is somewhat extensive, and it may yet be found on other of the intermediate islands.

The occurrence of natural hybrids in the Philippines is another point on which more accurate information was needed. *P. leucorrhoda* × *P. casta* ×, and *P. cynthia* × are generally understood to be from Luzon, where *P. amabilis* and *P. Schilleriana* grow together; but I should much like to see the results of intercrossing between *P. amabilis*, *P. Sanderiana*, and the white-flowered silver-grey species species mentioned by Mr. Roebelen as found in Mindanao. Also the natural nudes between *P. Sanderiana* and *P. Sanderiana* from the interior of that island.

Two little points in Mr. Roebelen's letter do not seem quite clear. The first is, where he speaks of *P. Schilleriana* being confined to central Luzon on the Pacific coast and a few adjacent islands, distant from the home of *P. Sanderiana* about 350 miles, and yet speaks of *P. Schilleriana alba* as most likely from South Mindanao, where he points out that *P. Sanderiana* actually grows. The second is, where he speaks of *P. Sanderiana* as "considered to be a natural cross between *P. amabilis* and *P. Schilleriana*, which it may be botanically, but it seems to be too far off from at least one of its supposed parents for this to be likely." Perhaps Mr. Roebelen, who has so largely increased our knowledge of the distribution of these interesting plants, will kindly explain.

My own impression, to a certain extent, coincides with his, that is, I think we have yet much to learn of the exact relation some of these forms bear to each other. If we could trace them geographically and thus find out which were purely divergent forms, and which genuine natural hybrids, occurring where these forms grew intermixed, it would be a great advance in our knowledge. Perhaps it is not too much to hope that such evidence will yet be forthcoming. *R. A. Rolfe.*

MALTESE GARDENS.

(Continued from p. 448.)

CAPTAIN PRICE'S garden is of even greater extent than that of Mr. Harry, and contains some twenty or more divisions. Being on the side of a hill the separate gardenettes are surrounded by balustrades and terraces, numerous short flights of stone steps connecting them as shown in fig. 82. Here and there one suddenly comes upon little temple-like structures, which command some pleasant view across the harbour. On reaching the summit one obtains a panorama of the harbour of Valletta, and the numerous fortifications, together with an extensive view of Malta and its walled-in fields, with square tower-like and windowless houses of the peasants dotted about.

Water being a precious article in Malta, as rain only falls in the late autumn and winter months, it is collected by the flat roof on all the houses, and then conveyed by pipes to a tank cut in the solid rock below. In Capt. Price's garden there are no fewer than twelve such wells. They are picturesque objects, because they all have two marble pillars with the usual cross-piece, also of marble, from which the bucket hangs. Many are elaborately carved in resemblance of Grapes and other fruit.

Like Mr. Harry's, this also abounds with interesting trees, shrubs, and herbs; but no description can give the remotest idea of the number of picturesque spots and "surprises" which meet one at every turn. Plants which are cultivated simply in pots at home here form masses of many square yards, such as *Richardia*, and all sorts of *Pelargonium* are rampant.

Of the more noticeable trees, there is a *Dracæna Draco* about fifty years old. It has a straight trunk, about 12 feet in height, whence a circle of branches radiate. It is 4 feet 6 inches in circumference at 5 feet from the ground, consequently it is 18 inches in diameter. *Schinus Mollis*, so common at Gibraltar and Malta in all the public places, is now bearing bunches of hot-tasting pink berries, which have given it the popular name of the Pepper Tree. The dwarf fan-Palm, *Ligustrum japonicum*, with great clusters of black fruit, and *Eunonymus japonicus*, with its red fruit; *Adhatoda*, *Justicia*, *Pittosporum Tobira*, *Hibiscus ponicensis*, and *H. Patersonii*; *Quercus Ilex* bearing acorns half as large again as in England; *Bignonia radicans*, *Stachys*, *Daturas*, &c.

Of climbing plants, which cover the numerous walls and balustrades, there are *Plumbago*, blue and white; the ever-present purple *Bougainvillea Solandras*, *Philadelphus*, *Stephanotis*, *Taconias* and *Ficus repens*.

Mention may also be made of the *Avocado Pear*, *Dasyliropsis*, *Mesembryanthemum*, *Agaves*, large masses of *Acanthus* and *Richardia*, and the usual profusion of *Pelargonium*, *Heliotrope*, &c. Several wild spots were profusely covered with the Ivy-leaved *Pelargonium*, Ferns, *Acanthus*, clumps of the yellow *Sempervivum arborescens*, the scarlet *Antholyza ethiopicum*, and *Aloes*; the interstices being carpeted with the ubiquitous weed *Oxalis cernua*, with its golden flowers.

In the garden, or rather square inclosure, within the Palace of Valletta, is an *Araucaria excelsa*, which was planted by H.R.H. Prince Alfred in 1858. It was then 7 feet high. It is now, as nearly as I could calculate, about 90 feet. It is over 6 feet in circumference at a height of 4 feet from the ground. *George Henslow, Malta, January 25.*

FOREIGN CORRESPONDENCE.

BERLIN.

"White Christmas, green Easter" is a proverb which is quite true of this year, and although Easter fell somewhat early, the shrubs and trees were green in great part. Spring arrived on March 13, and now *Lonicera xylosteum* and *tartarica*, *Ligustrum vulgare*, *Ribes rubrum*, *alpinum* and *Grossularia* are green; *Lonicera fragrantissima*, *L. Standishii*, *Corylopsis*—a very fine shrub—and *Forsythias* are in full flower. The *Crocuses* are past; *Hyacinths* are seen everywhere. The importations of living flowers from the Riviera consist of double *Ranunculuses* and *Anemones* only. Forced *Roses* are now in full flower. A new mode of growing *Roses* has come into vogue. Cuttings of forced *Roses* are made in the second half of March, and when rooted in April they are planted out upon heavily manured beds, and pruning is prohibited. In November the plants are potted, all twigs being retained. They form by that time of the year, in consequence of the heavy manuring they have received, bushes of 2 feet in diameter and as much in height. After the new year they are put into the forcing pits. I must confess I never saw such well formed double flowers as are on these bushes. Fisher Holmes, Marie Baumann, and La France are very well adapted to this method of culture, and one bush will carry, one year from the cutting, from thirty to thirty-five flowers, so that this mode of culture gives very good results when it is borne in mind that a single flower of *La France* is sold at the present time for 1s 6d.

The strike of the young gardeners on April 1 was not much felt, and of 2000 men who intended to strike only about 200 really came out. The demands put forward were eleven hours work and a

wage of 20s. monthly, including free board and lodging; or 18s. weekly without board and lodging. Most of the nurserymen agreed to these terms.

In the Botanic Garden there are now many Australian plants in full flower. It is true, the famous collections once cultivated in our botanic garden by Bouché are not now to be found there. For some years the cultivation of such decorative plants as zonal *Pelargonium*, *Begonia boliviensis*, *Alternanthera*, &c., was more highly estimated than that of rare, difficult-to-be-cultivated plants; but it is to be hoped that this state of things will be amended, and the botanic garden will again become a thoroughly scientific institution. Amongst the Australian plants, I remarked the following in flower, which are worthy of being more commonly cultivated:—*Hardenbergia monophylla*, a papilionaceous climbing shrub, with numerous clustered racemes of violet flowers, about 2 inches in diameter; *Clianthus speciosus*, a very nice climber, with bright green foliage and brilliant scarlet flowers of about 1 inch in length; both shrubs were about 1 foot high, and freely flowered. *Chorozemas* in variety

colour. The plant is said to give physical strength. The natives rub some of the leaves of the plant in their hands before engaging in races or palavers, which is said to give not only strength to the body, but also to the mind. The methods of culture pursued in this house differ widely from that in the others, for Mr. Braun having collected the plants himself in Cameroons, his idea is to give the plants as far as is possible a situation similar to that which they had in their native home. For instance, he places plants which grew in the cleft of two branches again in such a cleft, be it of two branches or of two planks. Epiphytical plants, as Orchids and Ferns, he cultivates only on branches or planks. He lays the rhizome directly upon them, covers it with some peat (roots of Ferns), and fastens it with copper-wire. In a short time the young strong roots run along the branch or plank, and after some months the wire fastenings as well as the peat may be removed. The branches and planks are hung as near to the glass as possible. Plants which grow naturally downwards, as do many Orchids, are hung in this situation, the apex down-

and a fasciation appears. A most important condition is that the plant experimented on must be in the most vigorous growth. Now, fasciations are hereditary, and it might be possible to create in this way one or another new and interesting garden plant in the manner of the Coxcomb. Experimental teratology is very important for gardeners; it is only necessary to question Nature in the right manner to obtain the right answer. *Our Berlin Correspondent.*

BELGIAN LETTER.

In the Liège Botanic Garden a mass of fifty plants of *Vriesia Leodiensis* is a conspicuous object, by reason of the rich colours of the flower-heads. Among the number of hybrids raised by M. Marechal, the curator, is *V. brachystachys*, which will be a great addition to collections of these plants. A dozen immense well-grown *Vriesias* likely to make a great sensation in the horticultural world, include *V. gigantea* (*V. Glaziovana*), *V. Reginae*, and others not yet determined. All these have been raised from seed imported from Brazil by Wallis.

I have never seen a more beautiful *Kentia rupicola* than that which is one of the greatest ornaments of the Botanic Garden. Equally deserving of notice are the three enormous *Rhapis aspera*; as a plant of large size, a beautiful *Ceratozamia mexicana* may also be named.

When visiting Messrs. Jacob Mankoy & Co.'s Nursery, I saw a superior variety of *Masdevallia Backhousiana*, introduced from New Grenada. It resembles *M. chimera*, but has longer hairs; the flower is as hairy as possible, which gives it a very curious appearance, and renders it a very distinct form in this great genus, the cultivation of which is much neglected in Belgium. I think this is owing to the wrong methods of cultivation which are adopted—plants are kept too warm, and do not get sufficient water. The collection of *Araucarias* comprises twenty of the more remarkable and rare species; for instance, *A. Cunninghamii* var. *glauca*, from New Caledonia; the type, quite blue, has a pretty, fresh look, and is rare; *A. Cookii pendula*, a variety without comparison; and the none less rare *A. Nierraschii*.

A new *Anthurium*, not yet in commerce, but which will no doubt be well received, is *Madame Ed. Lynaert*; it is strong, and has grand foliage. The large flowers are of the same form as *A. Andreanum*, but the spathe is a fine white, delicately veined with light rose. The spadix is rose. This fine acquisition has received a Certificate at Ghent.

The recent Antwerp show was remarkable for the quantity of flowering plants shown. Orchids were, however, hardly represented. As specimen plants we should name *Chorozema splendens*, *Pimelea spectabilis*, *P. ligustrina*, *Pandanus utilis*, *Begonia manicata*, *Clianthus puniceus*, *Solanum Warscewiczii*, *Pritchardia macrocarpa*, and *Phoenix rupicola*. Very fine were the exhibits of the chief of the Antwerp amateurs, M. H. Vanderlinden who had *Dentzia gracilis* measuring over 6 feet in diameter, also *Ledum palustre*, *Gaultheria acuminata*, and *Staphylea colchica*. Many decorative floral groups, and more than forty flower pictures, in which Orchids and *Paeonies* figured prominently, formed a feature of the display.

In the collection of M. Metdepemingen, of Ghent, are two remarkable plants from an importation of *Oblongoglossum crispum*, from Pachco. One of these has a branched spike, and is a puzzle. On looking at the flower you seem to have seen it in different degrees of colour, form, lip, &c., in the hybrids *Wilkeanum*, *mulus*, *excellent*, *Shuttleworthii*, *aureum guttatum*, *sulphureum*, &c. The second is like the former, of a good crispum type, with a mixture of yellow and red in the centre, and with extra heavy spots.

The Bruges horticultural show was a great success. M. Vincke-Dujardin sent a choice lot of Orchids, and M. Van Noten also sent a grand lot. Messrs. De Smet Brothers sent *Anthuriums*. M. Dumon de Marten had specimen *Palmus*. M. L. Spaey-van-dormalen had a novelty in *Kentia Dumoniina*. *Ch. de B.*

FIG. 52.—TERRACE APPROACH IN CAPTAIN PERON'S GARDEN, MALIA. (SEE P. 516)

are in full flower, these were in former times much cultivated. I remember well two specimens which were occasionally exhibited; they each covered a wire balloon of about 1 foot in diameter, and nothing could be seen but the brilliant flowers; the days of this kind of plant growing are now past. *Kennedyia glabrata* var. *tonnifolia* has a habit of growth much resembling that of a *Nertera depressa*, but it is covered with numerous red flowers instead of scarlet berries.

A very interesting house is that containing imported plants from the German colonies. Besides very strong seedlings of *Rhizophora Mangle* and *Pandanus candelabrum*—both cultivated in brackish water—there are very many decorative plants. A very fine climber is *Ipomoea paniculata*, whose Ivy-shaped dark green leaves contrast very finely with the white middling-sized flowers, whose tube is on the inner surface of a dark violet colour. The plant grows very freely, and often makes shoots of 15 to 20 feet in length. A plant much esteemed by the natives of the Cameroons is *Emilia sagittata*, a composite, whose bright green leaves are on the under surface of a blue-violet colour. The little heads, half an inch in diameter, are of a brilliant orange

wards. The watering is of the simplest, the plank being immersed in water. In this way epiphytical plants grow much better than in pots.

In one of my last letters, I said that it might be possible to create fasciations artificially. I, myself, commenced some experiments in this way with *Tropeolum majus*, and so far as I can now see, these have been successful. Some time since, Prof. Kuy, from the Agricultural High School, told me that Prof. Sachs, of Wurzburg, some years ago, succeeded in producing fasciation, and that he himself had also succeeded; and curiously enough, each of us three tried to succeed with the same species! The results of Prof. Sachs are published, as Prof. Kuy, told me, in the *Proceedings of the Vienna Academy*. Those of Prof. Kuy are not yet published, but he has preserved in alcohol the fasciations which he obtained. The leading idea I had I once communicated to you when I was at St. Petersburg, that if the vegetative point of a vigorously growing plant is destroyed, there are developed close together some new vegetative points, and the formation of new cells is so rapid that the single newly-formed buds cannot find time to separate themselves, and the consequence is that the young shoots adhere together,

INSECT PESTS.

HOW TO GET RID OF SCALE.—Dr. D. W. Coquillett, of Los Angeles, reports in the last number of *Insect Life*—which in this case ought to be called *Insect Death*—a means of destroying the scale that is so injurious to Orange trees. One oz. of dry potassium cyanide [poison] is mixed in a leaden pail with 1 fluid oz. of sulphuric acid and 2 fluid ozs. of water. A tent is placed over the tree, the cyanide is first placed in the leaden pail, then the water, and lastly the acid. A sack is thrown over the pail, and earth thrown on the edge of the tent, where it rests on the ground, to prevent the escape of the gas. The operator, of course, beats a retreat speedily from the interior of the tent, which is allowed to remain over the tree for a quarter of an hour, and is then ready for use upon another. The quantity of poison required varies, of course, with the height of the tree; but the proportions of the ingredients remain the same. For a tree of 18 feet in height, 15 oz. of cyanide, 30 of water, and 15 of acid, are required. It is the only method known by which scale insects on the fruit can be destroyed at one operation.

CLOTHES MOTHS.

Prof. Riley, in the last number of *Insect Life*, alludes to the three most common species, *Tinea pellionella*, *T. tapetzella*, and *Tinea olivella*. A description and an account of the mode of life of each creature are given, as well as woodcut illustrations. The remedy suggested is, that in the latter part of May, all garments, furs, and other objects likely to be infested, should be thoroughly shaken and exposed to the light and air, and then subjected to a thorough spraying with benzine. The benzine spray should also be applied to all cracks in the floor, corners of dark cupboards, &c.; carriages unused in the winter should be similarly treated. As the vapour is very inflammable, care should be taken to avoid bringing any light into the rooms or near the garments until the smell has disappeared.

ABSENCE SPRAYING.

It has been asserted that the spraying of fruit trees when in blossom will lead to the storage by bees of poisoned honey. Professor Riley, however, says that in the American States experience has shown that the judicious and cautious use of arsenical sprays in orchards "is attended only with benefit, and that the possible harm is reduced to such a minimum as almost to justify its being left out of consideration." We commented lately on the singular fact that while in Canada and in America "Paris green" and "London purple" were very largely used, yet in this country London purple, in spite of its name, was not known, and finds no place in the ordinary books of reference. Further inquiry elicited the fact that London purple was actually manufactured in this country as a bye product in the manufacture of aniline dyes (magenta), and exported largely to America, though, as we have said, unknown here. The repeated recommendations for its use made by such specially trustworthy authorities as Professors Riley, Saunders, and Fletcher induced us to enquire of the manufacturers the reason why a preparation of so much value when properly used and cautiously handled, and one so largely used in America, should not be procurable here. The reply was, that the quantities used here were so small that it did not pay to advertise, or bring the substance before the public. Fruit growers here ask to be supplied with a pound where their transatlantic brother asks for a hundredweight.

THE FLUTED SCALE INSECT.

In the twenty-first number of the *Bulletin of the United States Department of Agriculture*, Mr. Kuebele gives an account of his visit to Australia to investigate the natural enemies of the fluted scale, *Icerya purchasi*, with a view to introduce them into California, where the scale is exceedingly destructive. Amongst other things, a lady-bird, *Venalia cardinalis*, was observed preying on the scale, and found to be a

most effective agent in the destruction of the fluted scale. Steps were accordingly taken to introduce the beetle into California, and apparently with the best results.

COCKROACHES.

Professor Riley, in *Insect Life*, recommends the use of insect powder (Pyrethrum), as the best and most efficient remedy. This should be puff'd into all crevices in the floor and elsewhere. If this is done persistently and thoroughly, there is an end to the cockroaches.

THE ROOT-KNOT DISEASE.

The United States Department of Agriculture has published a valuable report of the root-knot disease, which affects the Peach and Orange in Florida. The report has been prepared under the direction of Mr. Riley by Dr. Neal, and is illustrated with twenty-one well-executed coloured plates. Dr. Neal's paper will have to be compared with the writings of Ritzema Bos, Beijerinck, and others who have studied these creatures in Europe, as Dr. Neal does not profess to be a specialist, and the literature of the subject was not accessible to him. Nevertheless, Dr. Neal has produced a valuable report.

The burning of infested plants on the ground is specially insisted on, allowing the land to remain fallow. A certain species of ant preys upon the worm. Alkaline manures (potash salts), are useful as promoting vegetation, but actual vermicides hitherto have, generally speaking, done more harm than good. The disease, unfortunately is far from being unknown here, and it, or a very closely corresponding disorder, affects plants of very numerous natural orders.

COLONIAL NOTES.

In the Queensland Botanic Gardens, Rockhampton, which is under the Tropic of Capricorn, there are good plants of *Vitis rupestris*, *Cissus monticola*, and *C. cordifolia*, raised from seed sent by Baron von Mueller; they will most probably bear a few fruit next season. A plant of *Strophanthus hispidus*, raised from seed from the same source, is doing well. Two plants of tuberous-rooted *Ipomoea* (*Ipomoea calabra*, see *Select Plants*) are planted out, and specimens will be forwarded as soon as they can be procured. The *Adamsonia digitata* does well here, it has stood well during two winters, and may now be looked on as a success. *Bertholletia excelsa* plants are very healthy, but appear to be of slow growth. The *Livistona Maritima* must be a beautiful Palm, if its foliage keeps the colour it has at present (a beautiful rich copper). We have four plants doing well. *Borassus flabelliformis* appears to be quite at home here. *Catalpa speciosa* grow very rapidly, and will most probably turn out a good useful shade and timber tree. *Lespedeza striata*: I find this plant succeeds best if sown among the natural grasses in moist ground, in this way it covers the ground well.

As a curiosity in the adaptability of plants, I may mention that last week we had Pine-apples and Apples gathered from the same bed, the Apples are small, but well flavoured.

A few days ago, a station owner out West told me there was a species of *Ipomoea* (*I. calabra*, tuberous rooted) growing in the scrubs on his station used as food by the blacks; he describes the flowers as deep purple, and promised to have some of the tubers taken up, and sent down the first chance. We are having a grand season here. I would like you to see how things are growing with us at present. *J. S. Edgar, Rockhampton.*

JAMAICA.

The last *Bulletin* of the botanical department contains articles on the culture of *Coca* (*Erythroxylon Coca*), and on the abandonment of Orange culture in the Azores, due to a disease ("gumming"), and to

the unremunerative prices obtained by the growers. Other articles refer to the manufacture of Lemon essence in Sicily, and fruit-candy in Italy.

PLANTS AND THEIR CULTURE.

GLIOS, &c.—The bloom of hybrid *Amaryllis* will soon be over, and the bulbs should be put in a light position, a shelf or stage close to the glass in an intermediate-house being a suitable place for them. *Amaryllis aluica* is useful in the early months of the year, and it will give satisfaction if repotted annually in 6-inch pots. We grow at Syon a large number of this species on shelves in early vineries, and the plants do well when so treated, producing a large quantity of bloom. A formosissima is another free-blooming variety to succeed *A. aluica*; it has flowers of a beautiful rich colour, which are very effective when cut for vases. It needs treatment similar to that given the first-named species.

Gloxinias are often so much shaded that they become drawn; they do better with less shade during sunshine, if they have become inured to it from the first; positions on shelves near the roof suit them well. Any repotting needed should be attended to, for if the plants are allowed to get too far into bloom before repotting, a check is given them. Young plants may be pricked off into small pots, and these plants will flower late in the autumn. Weak manure water is beneficial to Gloxinias when the pots are full of roots. We use Clay's Fertiliser once a week.

Gloriosas, as they fill their pots with roots, should be top-dressed with dry cow-dung, and kept trained on wires near to the light. The tubers of *Achimenes* to flower late should be started, and also a few pots of *Gesneras*, for early autumn flowering, and later, and these tubers should be selected from such as are just beginning to grow. The main lot should be started later when the flowering stove plants are over, as they then come in more acceptably. A large proportion of peat, a little loam, leaf soil, and coarse silver sand, make a suitable compost for these plants; and very little water must be given them before active growth begins, and they should not be syringed overhead. A shelf out of the reach of the daily syringings suits them best. Any of the *Eucharis amazonica* requiring shifting or dividing may be attended to. These plants do well in a compost of three parts turf loam, a small quantity of leaf soil, some charcoal broken small, and $\frac{1}{2}$ -inch bones. I put the bones directly above the corks, and do not shift these plants often, but supply manurial food, and grow them on continually, and do not dry them off at all, and by following this plan I get flowers in quantity three times in a year. *Hymenocallis* and *Pancratium* should be repotted if this appears necessary. These plants are liable to be infested with red-spider and thrips, and should not be grown therefore in dry hot-houses; or the frequent washing and syringing of the undersides of the leaves be neglected. *Hymenocallis macrocephala* is a fine plant when well flowered, the very fragrant flowers lasting a long time. The plant needs similar treatment to *Eucharis*. *Imantophyllum*, now useful, should have weak liquid-manure frequently, which will induce the plants to throw up strong flower stalks, and give substance to the flowers. *J. miniatum* and *J. splendens* will produce a succession of spikes if well treated. The latter is the best for the purpose, as it produces a longer spike and larger blooms. They do well in *Eucharis* compost, and will remain much longer in bloom if removed to a cool and dry house. They do not require to be often shifted, but to have plenty of manure-water. Most of the species of *Crinum* should be growing freely. Much shading and all over-potting should be avoided; the compost advised for *Eucharis* will suit these plants. Plunge the pots whenever practicable in coco-nut-fibre, or half-decayed leaves, giving plenty of water and liquid-manure. When they are growing, syringe them daily; but withhold water as they complete their growth, giving the tubers a thorough ripening. *Vallota purpurea* should also be growing freely. A place in a greenhouse, near the glass, to prevent drawing, suits them. *G. Wythes, Syon House, Brentford.*

THE ORCHID HOUSES.

EAST-INDIAN HOUSE.—Great care should be taken to keep this house at an even temperature, whatever may be the fluctuation in the temperature outside, variable degrees of warmth checking active growth readily. Shadings must be let down during bright sunshine, but run up again during cloudy intervals; a moderate amount of heat should be kept up in the hot-water pipes, and regulated as may be found necessary. The sooner the Phalenopsis plants are started into growth in the spring the better. In ventilating, do not give too much air by the top ventilators, but give rather more at the bottom if the shutters are placed over the hot-water pipes, thus preserving the balance of air and moisture.

Keep a look-out on all *Acerides* and *Vandas* which have been spotted, so that no shell snails or slugs make havoc with the young roots. Traps should be continually set for these; Potatoes cut in halves, and hollowed out in the centre, make excellent traps not only for snails, but for wire-worms, centipedes, wood-lice, and others, the larvae of which are introduced in sphagnum moss. Whatever traps are used, night searching with a lamp should not be neglected.

Calanthe Veitchii and *C. vestita*, if now showing young growths above the potting material, should, on the first fine sunny morning, be given a thorough soaking in warm water. This will last them for some time if the pots are syringed twice a day afterwards, the plants themselves not being syringed for some few weeks yet, otherwise the young growths will spot; if this occurs, they seldom do well, and always look badly for the rest of the year.

Oncoglossum Lutescens, a beautiful Orchid that seldom does well, I find to grow satisfactorily if placed upon a raft, stood inside a large pot, peat and sphagnum moss being placed about the roots. The plants should be placed close to the glass, and but little water afforded until roots are seen to be pushing forth. No water may lodge in the centre of the young growths of this plant. *Cypripedium bellatulum* is now throwing up its flowers, and the majority of the spikes are twin flowered; a little guano rubbed into the water will prove beneficial to these plants, and care should be taken to let as little as possible of this manure-water enter the heart of the plants, otherwise it will discolour them, but clear water may be poured with impunity over the plants when dry. The temperature should be as nearly as possible the same as that recommended in the last Calendar.

Cattleya-house.—The past winter seems to have been favourable to the ripening of *Cattleyas*, for seldom do I remember seeing them push so many flower-buds as is the case this season. *C. Bowringiana* should now be re-potted; it is a strong rooter, and I find that it, like all the thin-rooted *Cattleyas*, clings firmly to the pot, so that big shifts should not be given it. But little water should be given, not repotted plants for a month afterwards—in fact, not until the roots are seen to be growing freely, when a good supply should be afforded. Shading for this house will now have become necessary at times. *C. Gaskelliana*, if now pushing up growth, should not be too liberally supplied with water before the leaves burst and show if the growths are sheathing, for big growths without flowers are very disappointing in any plant; but keeping on the dry side at the proper moment will usually ensure bloom. Keep the atmosphere of the house somewhat moist, yet buoyant, the bottom ventilators being seldom shut, unless while cold winds blow. The temperature may range from 65° at night to 80° by sunheat. *A. G. Catt, Parkfield, Worcester.*

FRUITS UNDER GLASS.

THE FRUITING PINE HOUSE.—Continue to encourage the swelling up the tips by the maintenance of a high temperature, neither too arid nor too humid, but avoid any attempt to reduce warmth by admitting cold air in large quantities, as this always extracts the moisture from the air in the house, and distresses the plants; whereas insufficient ventilation causes drawing of the leaves and crowns, and indifferently flavour. The house should be damped down, and closed before the sun quite leaves it, and the warmth run up to 95°, and allowed to fall during the evening to 70°, some of the humidity escaping by a slight vent left at the top of the house. Whenever the

sun shines warmly the top-heat should be shut off, and, if necessary, the bottom-heat valves opened, and *vice versa*; at night-time and in cold or cloudy weather shading in the form of a double thickness of 1-inch mesh netting should be kept in readiness to use during bright sunshine. Plants selected for fruiting in January and February last which instead of showing fruit have made growth, seldom prove satisfactory, and although they may become of a very large size, usually produce small fruits. If any of the Black Prince type show bloom now, there is the greater certainty of securing good fruit, which will ripen well at base and top alike.

Succession Pines will be growing vigorously, and should have more and rather stronger manure-water, the syringe being plied amongst them moderately, and the walls, floors, and dry corners kept moist, but seeing that no water accumulates in the axils of the leaves. Let the bottom-heat be from 70° to 80°, ventilate freely, but avoid cold draughts. If the plants are not able to stand sunshine, and show bronzed or "cupped" leaves, give the plants a small amount of shade during bright sunshine.

Suckers on old stools and which are of a large size may be potted into 7-inch pots; and earlier potted-ones, if found to be well-rooted, may be moved into fruiting pots, this being preferable to waiting until the general potting time comes round, and a better succession is secured. Keep stools which have broad leaves and have produced good-sized fruit for propagation purposes.

Melons, from the time the blooms are set until the swelling of the fruit ceases, should have plenty of water, and some manurial stimulant, as, if once checked, they are seldom satisfactory; but as soon as swelling has ceased, and during the brief period before colouring commences, water should be gradually withheld, and the atmospheric moisture reduced in quantity, so as to impart flavour, and avoid the cracking of the fruit. Should stem-canker show itself, a little quick-lime rubbed in carefully will generally prevent any fatal termination to the plant. Cut the fruit as soon as the aroma is perceptible, and the foot-stalk parts slightly from the fruit. Plant out successions in firm soil consisting of turfy loam and road-scrappings; regulate laterals by thinning and stopping, and endeavour to secure the opening of six female flowers at the same time, and make use of nets or boards to support the fruit. Top-dress the hills with rough loam and bone-meal as may be required. Sow more seeds. *Blenheim Orange* is good for frames and houses, except for the earliest crop.

Cucumbers, spring-sown, and grown in houses or frames, will now be fruiting, and must be regularly thinned at short intervals, and the crop of young fruits reduced in number. Soot or weak guano-water, house-sewage, or liquid manure given alternately is of benefit, together with top-dressings of horse-droppings, turfy manure, and bone-meal, syringed heavily, but being careful to have the foliage dry by nightfall. Sow for succeeding crops both frame and ridge kinds. *Rollison's Telegraph*, if the strain be a good one, cannot be excelled as a frame variety. *W. Cramp, Madresfield Court, Malvern.*

THE HARDY FRUIT GARDEN.

RASPBERRIES.—Quarters of these fruits should be cleared of weeds, and dressed with soot. If mulching was applied, as advised, the same should be raked to spread it well amongst the stools. If manure be plentiful, and the soil not rich, another dressing may be afforded it, for Raspberries cannot be grown well without an abundance of rich food and much moisture. The crop will, I think, be a heavy one this season, and will well repay extra attention afforded the plants. If slugs abound, it is a good plan to dust well all mulchings and shoots with fresh unslaked lime.

Currants and Gooseberries.—These look very promising, and all going well, the crop will be a heavy one; however, there are many pests to contend with before gathering-time. After danger from frost is passed, the most dreaded enemies are the caterpillars, of *Nematus Ribesii*, *Gooseberry saw-fly*, and *Tenthredo grossularie*, *Currant sawfly*. If clearing away 2 inches of soil round bushes affected by the creature last year, and burning the same, was not adopted, fork the soil lightly round them now, and apply some powdered lime, as these pests lie just underneath the surface.

Disbudding.—Timely disbudding and stopping of strong shoots in order to equalise growth in wall and other fruit trees, is an important operation, and should never be neglected. Much judgment is requisite to know how to disbud properly; and the operator must be guided by the kind of fruit tree, the form it is desired to take, soil, and climate. A safe rule to follow is to thin out the shoots, so that no one of them will overlay another; or, in other words, each shoot should have full exposure to light.

With Apricots which are growing strongly, and making a profusion of wood, persistent stopping of sub-laterals will prove conducive to fruitfulness. It matters little how long the new shoots make it may be, if the side laterals are kept closely pinched in throughout the season—fruit-buds will form on their entire length. Maggots are frequently troublesome on these trees, and their presence may always be suspected when the leaves curl up; and on examination they will be found curled up in them; the only remedy, therefore, is hand-picking.

Protection.—Where branches of Spruce Fir, &c., have been employed for the protection of Apricots, Peaches, and Nectarines, care must be exercised that the branches are not placed so closely together as to exclude light and air, or great injury will be done. Usually the needles of Fir branches will drop after a little warm sunshine, but if this should not take place rapidly, some of the branches ought to be taken away from the wall; and as soon as the fruits are set, all the branches may be removed, but not all at once. Blinds on rollers or strips of Tullay, hexagon netting, or other protecting material, must be continued to be employed, as a safeguard against morning frosts. *A. Evans, Lythe Hill, Haslemere.*

THE KITCHEN GARDEN.

Put the Dutch hoe among Onions sown in March. If the Onion maggot is feared, early and frequent applications of fresh soot should be given when the tops are damp with dew, and the same will also serve as a fertiliser.

Potatoes.—The tops of these, if peeping through the soil, should have a little fine soil drawn over them to prevent injury by frost, and when too large for this being done, some litter or bracken kept in readiness for the purpose should be laid over them when required. For supplying young tubers at a late period, some approved varieties of Kidneys should have their sprouts rubbed off, and be put in a cool place to be planted as may be required.

French Beans.—Some rows of the *Ne Plus Ultra* may now be sown either at the foot of a south wall, or in a warm well-sheltered border. Plant in shallow drills 18 inches apart, and from 6 to 8 inches from bean to bean. Some may also be forwarded in small pots, planting three beans in each pot, and give them cold-frame treatment for the present; these will produce some nice dishes ten days to a fortnight before those that are sown outside. It is somewhat too early to plant large breadths.

Tomatoes.—Plants may be shifted into 32's, and assisted with a small amount of warmth, so that by planting out time they will have attained sufficient strength to at once commence fruiting. Pot the plants firmly, and tie each to a strong stick. For fruiting outside, I find the single-stem plant the best; and all side shoots being removed as fast as they appear.

Mushroom beds may now be made in sheds, or positions where the beds may be kept in darkness. The materials should not be allowed to heat till they become dry, but should be frequently turned till the rank steam and strong heat are dissipated, and then made up firmly; spawned when the warmth has declined to 98°, and cased over with adhesive loam. Beds in bearing will require more water than hitherto; rain-water at 85° is best. If possible, keep the warmth of the Mushroom house under 60°.

Saukale.—Planting must not be further delayed; cut the crown level of old plants which have yielded their crop for the season, and put a little coal ash or fine soil over each.

Capsicum plants may be picked off, putting three plants in a 3-inch pot, and using sandy soil. Keep the plants on a shelf near the glass in heat, and shade slightly until established. In cold districts Capsicums are best when grown indoors, but strong forward plants will thrive very satisfactorily if properly hardened off when planted out in warmer districts. *H. Markham, Mereworth Castle, Maidstone.*

EDITORIAL NOTICES.

Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor. Such communications should be written on ONE SIDE ONLY OF THE PAPER, and sent as early in the week as possible.

Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are also solicited.

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

THURSDAY, MAY 1.—Linnean Society.

SHOWS.

TUESDAY, APRIL 29.—Manchester Royal Botanical Society, Royal Aquarium, Westminster (two days).

SALES.

TUESDAY, APRIL 29.—Orchids in Flower at Protheroe & Morris' Rooms.
Store and Greenhouse Plants, Shrubs, Border Plants, &c., at Stevens' Rooms.

WEDNESDAY, APRIL 30.—Lilies, Greenhouse Plants, &c., at Protheroe & Morris' Rooms.
Clearance of Greenhouse Plants, Glass Erections, &c., at the Eltham Nurseries, Eltham, by Protheroe & Morris.

THURSDAY, MAY 1.—Orchids in Flower and Bud, at Stevens' Rooms.
FRIDAY, MAY 2.—Imported and Established Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—50°.7.

The Horticultural Hall. THE meeting of the Horticultural Trade, convened at the rooms of the Royal Horticultural Society on Tuesday last, was not so numerously attended as it might have been, but for all that it was hopeful and zealous. The Council was well represented, and among those present we noticed Messrs. Bull, Banyard, Cannell, Cheal, Fraser, Lane, Noble, Prince, G. Paul, Pearson, Sherwood, Rivers, Sander, Williams. The business of the meeting was briefly introduced by the President, Sir TRIVOR LAWRENCE, who then called on Baron VON SCHRÖDER to explain the scheme in detail. This he did in terms as lucid and straightforward as they were energetic. The Baron is an excellent speaker, evidently thoroughly in earnest, and if his arguments, statements of fact rather, do not convince the horticulturists of the soundness of the prospects, of the validity of the security, and of the duty of the trade to support the scheme, even in their own interests only, we do not know what will do so. The scheme has been lately published in our columns, so that we need not

enter into full detail. It must suffice to say that lovers of horticulture are requested to lend (not to give) to Sir TRIVOR LAWRENCE, Baron HENRY SCHRÖDER, and to EVERARD HAMBRO, Esq. (not to the Royal Horticultural Society), a sum of not less than £40,000, but as much more as possible. The interest of the greater part of the lump sum would be sufficient to secure the ground-rent for the site on the Embankment, and a portion of the capital would be expended in building a suitable Horticultural Institute, for the use of which the Royal Horticultural Society would pay rent, as they do now, for what the Baron contemptuously called a "Dust-bin."

Any of the minor organisations and special societies, the Lindley Library, the charitable societies, and other associations connected with horticulture, could be housed in the same building, a permanent exhibition of horticultural appliances, &c., held, and a rent obtained by letting the large rooms and basement when not required for horticultural purposes. The money would be paid back (without interest) in the form of bonds, and the faster the money comes in, the faster will the bonds be redeemed.

The security is beyond all doubt; all that the horticulturists are really asked to do is to sacrifice the interest on the sums they subscribe. Surely this is a very small matter by comparison to the immense advantages to horticulture generally, and the direct benefit of those who have business tact enough to avail themselves of the opportunities the proposed Institute would offer. The names of the first six gentlemen on the list, each of whom has promised to give £1000, should surely inspire sufficient confidence in the scheme. Here are the names in question: The Duke of Westminster, Lord Rothschild, Lord Revelstoke, Baron Henry Schröder, E. A. Hambro, Esq., J. S. Morgan, Esq. The President offers £250; Messrs. Veitch, collectively, £200; Messrs. Sander & Co., £200; Hurst & Sons, £200; Baron Erlanger, £250; Henry Tiarks, £200; Sir Edmund Loder, £200; Mr. Haywood, £100; Sutton & Sons, £100; B. S. Williams, £100; besides a large number of horticulturists of all grades and descriptions who contribute smaller sums. We cannot but think, after the meeting on Tuesday, that success will be achieved, and that the dream in which we have so often indulged will become a substantial reality.

The Royal Horticultural Society has, it is evident, turned the corner of its difficulties, and so far from "dying a disgraceful death in a dust-bin," is, if properly managed in the interests, not of fashion but of horticulture, once more on the high road to success. The Baron secured a point by his alliterative phrase above quoted, but it is quite clear that the horticulturists are not going to permit the Society to undergo disgraceful extinction. Thanks to the labours of the last two years, and the unwearied devotion of the officers, the Society has thrown off the dreadful slough which fettered its movements at South Kensington, and as it has been by far the most useful of our horticultural societies in the past, so it will, in the future, be more than ever the representative of national horticulture and all that that implies.

Reverting to the proceedings at the meeting, we may add that the first resolution, proposed by Mr. BULL, and seconded by Mr. BUNYARD, signified the cordial approval of the programme put forth by Baron SCHRÖDER, and pledged the members of the trade to do their utmost to carry it out. Mr. GEORGE PAUL, Mr. SHERWOOD, and Mr. BRUCE FINDLAY spoke in

support of the scheme, the latter speaker emphasizing the fact that this is no mere metropolitan scheme, but a national one, and that the wider the basis the greater the chance of success.

The second resolution, proposed by Mr. HARRY WILLIAMS, and seconded by Mr. CHEAL, nominated a representative committee of the British nursery trade, to aid in carrying out the scheme, and which, for our part, we very earnestly press upon the attention of our readers, not in the interests of this Society, or that branch of commerce, but on the grounds of national utility.

THE VEITCH MEDALS.—It was a worthy innovation that the Trustees committed when, a year or two back, they decided to honour the gardener for his work in general, and not merely for his success in the contests of the Exhibition tent. Last year the Medal went to Mr. BARNES, this year to Mr. DAVID THOMSON and Mr. BRUCE FINDLAY. Could a better selection of representative men have been made? Will not those whom in future the Trustees think fit to select feel an additional honour in the remembrance of their predecessors? JAMES VEITCH, to perpetuate the memory of whom the medal was instituted, was a shrewd judge of men, and his selection of gardeners to fill important posts showed it. It is, therefore, appropriate that the Veitch Trustees should endeavour to carry out the same principle by awarding honour where honour is due. In their replies to the compliments paid them two things were specially striking. Mr. DAVID THOMSON spoke of the satisfaction he felt in having fulfilled his duty as a servant. Mr. FINDLAY in his turn spoke of the high aims of horticulture contributing to the necessities and pleasures of every individual, and at the same time as being of great national benefit.

RATING NURSERIES AND MARKET GARDENS.

—In the Budget proposals of the Chancellor of the Exchequer, is one for defining trade machinery for rating purposes. Under this heading would probably be included such trade fixtures as hot-water boilers, greenhouse pits, &c. For a fuller exposition of the aims and character of the proposed measure, we refer our readers to an article by Mr. GOODCHILD, of the Nursery and Seed Trade Protection Society, p. 515.

THE DAFFODIL CONFERENCE.—We are glad to hear that the financial results were satisfactory, for while we recognise the importance of having a town house for show and business purposes, we can never forget that the highest and best work of the Society as a scientific institution must be done at and in connection with Chiswick. Chiswick, too, is the centre of an enormous population, a large proportion of whom ought to be supporters of the Society, and who should appreciate the advantages of the Society's garden.

HORTICULTURAL CLUB.—The usual monthly dinner took place at the Hotel "Windsor" on Tuesday last, when Dr. HOGG presided, Messrs. DAVID THOMSON and BRUCE FINDLAY being the guests of the Club. Among those present were Messrs. F. W. Burbidge, A. F. Barron, S. Barlow, C. M. Cowan, D. Thomson, Jr., F. Bull, D. Morris, Rev. W. Wilks, P. Crowley, A. H. Pearson, H. Turner, G. Banyard, G. Paul, S. Ingher, A. J. Veitch, and the Rev. H. D'Ombraim.

LINNEAN SOCIETY.—A meeting was held on April 17, Mr. CARRUTHERS, F.R.S., President, in the chair, Messrs. E. C. GALEN, T. JOHNSON, W. F. KIRBY, J. B. CARRUTHERS, and J. S. TURNER were elected Fellows. Lord ARTHUR RUSSELL, on behalf of the subscribers to a portrait of Sir JOSEPH DALTON HOOKER, which had been painted at their request by Mr. HERBERT HEIKOMER, R.A., formally presented the portrait to the Society, and in a few words expressed the satisfaction which he was sure would be felt at the acquisition of the likeness of so dis-

FIG. 83.—*ABI-TOLOCHIA GOLDEANA*: FLOWERS CREAM COLOURED, WITH PURPLISH VEINS. (SEE P. 525.)

tinguished a botanist. It was announced that a photograph of the portrait was in preparation, of which a copy would be presented when ready to every subscriber to the portrait fund. Dr. EDWARD FISCHER, of Zurich, exhibited and made remarks on certain species of *Polyporia* bearing a sclerotium possessing the structure of *Pachyma cocos*, but it was doubtful whether the *Polyporia* represented the fructification of the *Pachyma*, or was merely parasitic on it. Mr. GEORGE MURRAY expressed himself in favour of the latter view.

— At the evening meeting to be held on May 1, 1890, at 8 P.M., the following papers will be read:—1. "Quantitative Examination of Water-meadow Herbage," by Professor W. FREAM, F.L.S.; 2. "On some Old World Species of Scorpion," by R. J. Pocock.

WILDSMITH MEMORIAL.—The monies already received in aid of the above are as follows:—

HAMS HALL.—Too often have we had to lament the destruction of country seats owing to the absence of adequate precaution. We do not know whether the destruction of Lord Norrox's place is attributable to any such lack. It is fortunate that the library is rescued. The building itself was not remarkable.

FRUIT AT THE ANTIPODES.—We read in the *Maitland Mercury* for February 18 this year, that the fruit production of the Singleton district is assuming very large proportions. At the Farmers' Union sales, held every Tuesday, immense quantities of Grapes, Apples, Pears, Quinces, Tomatoes, Melons, &c., are sold to numerous buyers who now attend the auction sales regularly from Sydney, Newcastle, Branxton, Muswellbrook, Scone, and other northern towns as far as Armidale. Grapes form the principal item in February, and splendid fruit was sold as low as one halfpenny per lb. at that period.

A NEW VARIETY OF BROCCOLI.—Messrs. HURST & SOX, Houndsditch, London, send for our inspection an immense head of Broccoli which has a perfectly firm curd of creamy-white, measuring 32 inches in circumference. The heart-leaves are sufficiently large to protect the large head from discoloration by sun or frost. Mr. B. Hartland, Temple Hill, Cork, is the raiser.

TREE PÆONIES AT MR. WM. GORDON'S.—At the Fullwell branch of the Nurseries of Mr. Wm. Gordon, of Twickenham, and which is largely devoted to plants imported from Japan, Tree Pæonies have been in great beauty for the past ten days. At present many are in bloom there, some of the flowers are of an extraordinary size, and some delightfully fragrant. As seen, the following would make a good selection:—Snowball, a fine white; Flag of Truee, semi-double white; Lady Lotie, white, shaded yellow; Spring, white, with violet centre; Prince Albert, maroon, semi-double;

Lady Dora, bright pink; Lord Randolph, bright pink, flaked white; Dr. Gordon, immense single rose-pink; Lady Doble, white, flaked rose; Venus, single white. There is also to be found at the nursery a curiously dwarfed Japanese Cherry tree in bloom, and a good houseful of Lilies.

ANEMONES.—Among the Daffodils at Chiswick last week, and forming a marked contrast to them, were some varieties of *Anemone coronaria*, exhibited by Mr. GILBERT, of a very high degree of excellence. The form was regular enough to please a florist, the colour a particularly rich luminous scarlet. The stamens are a deep violet colour, the filaments slender and expanding into a lanceolate blade, with recurved margins, this blade, of course, representing the anthers. The pistils are represented by a regularly disposed tuft of many rows of linear obtuse spreading petals double the length of the stamens, and completely concealing them.

SPRING IS COMING.—We can testify to the fact, as having been privileged to hear the cuckoo in Richmond Park on the 16th, and to see a swallow in the same locality on the 22nd.

FLOWERS AT STANMORE HALL.—In the lofty Orangery and Camellia-house which stands in this fine garden at Stanmore, now the property of W. K. D'Arcy, Esq., the gardener, Mr. Wm. Tidy, has made good use of the pillars and roof to secure an almost endless supply of Roses, and also a large quantity of Grapes of good quality; some seasons as many as 400 bunches being got from this house alone. On the iron pillars and roof are profusely flowered Roses; Lamarck, Niphetos, and others having already given fine supplies of bloom which will be continued throughout the season. A noteworthy feature is the profusion of bloom on the hybrid perpetuals trained to the pillars, the old Cabbage Rose la Reine being one of the most beautiful and prolific. The body of the house is occupied by large Orange, Camellia, and Rhododendron trees, one specimen of the beautiful white R. Gibson having hundreds of blooms, and smaller ones raised by Mr. Tidy from seeds of the large specimen, are very pretty objects. A *Chamaerops Fortunei* some 20 feet high, occupies the centre under the dome, and at the back is a marble bay very tastefully arranged with white Arums and Ferns. Among the plants in the house are specimens of many interesting Ferns and flowering plants, by no means common. *Libertia ixioides* is very well flowered, and a gigantic standard Cactus, furnished with hundreds of buds, will shortly be a splendid sight. In the lesser plant-houses the Azaleas are good, the *Eucharis* and the double *Cinerarias* excellent; and the *Primulas* and other flowering plants of the season show the skill of a master hand. Among the few Orchids to be found here are some highly developed plants of *Cypripedium barbatum grandiflorum* in bloom.

NEPENTHES.—An interesting article by Mr. GEORGE TRUFFAUT, on the hybridisation of these plants, is given in the *Revue de l'Horticulture Belge*, April 1. It contains a list of the hybrids obtained up to this time, with an indication of their parentage and of their raisers.

"JOURNAL DES ORCHIDÉES."—In the second number of this periodical, the use of shreds of tobacco-paper thrown on the hot water-pipes of the Orchid-houses is recommended. The effect is continuous without the disadvantages of fumigation. Another article is devoted to the potting of Orchids, and one to the culture of Orchids for market.

TURNIP-TOPS.—A farmer at Bury St. Edmunds has lately published his experiences of Turnip-tops, which are as striking as they are instructive:—Last month he sent 150 bags of "Tops," each weighing 60 lb. to 70 lb., to the Borough Market, and they sold for 1s. 3d. each; total, £9 7s. 6d.; of this sum the middleman appropriated £3 2s. 6d., or

at the rate of, say, 33 per cent., for "commission," while £2 12s. 4d. was swallowed up for carriage, including 2s. for empties, leaving £3 12s. 8d. Next he forwarded 70 bags to Stratford Market, which brought £2 14s. 3d.; for this transaction the middleman extorted £1 3s. 4d., or nearly 50 per cent., the carriage being 19s. 11d., leaving 11s. For the 220 bags of Tops, therefore, the farmer received cheque for £4 3s. 8d., against which was the set-off of 3d. per bag for gathering, and 20s. for carting and other labour; net result, 8s. 8d.

A NEW FLORA OF WARWICKSHIRE.—It is many years since PENNY'S *Planta Warwickensia Selecta* was published, and meanwhile botanical science has made great advances, and immense changes have taken place in nomenclature and the subdivision of species. It has long been obvious that a new county flora is a book to be desired. Quietly, perseveringly, and effectually, for something like a quarter of a century, one of the best, probably the very best, systematic botanist born in Warwickshire, Mr. JAMES E. BAGNALL, of Birmingham, Associate of the Linnean Society, has been collecting materials for a full and reliable account of the flowering plants, Ferns, and Mosses of his native county, and these have been, with great care and labour, duly arranged and systematised, and are now ready to be handed to the printer. Mr. BAGNALL'S *Flora* will include about 1000 more species and varieties of plants than were recorded by PENNY, and will make a volume of about 500 pages, demy 8vo, set in brier, and is indeed the first complete *Flora of Warwickshire* ever published. The plan pursued by the author is to divide the county into ten districts, based on the river drainage. Each of the rivers is traced in its course through Warwickshire; the district watered by it is described—including an account of its physical and geological features—and the more special plants enumerated. The status and distribution of each plant is given, those which are local and rare being traced through each district in which they occur; the synonyms of the older botanists are quoted, together with habitats, times of flowering, &c. There is also a summary of the geographical distribution of each plant, with lists showing their occurrence in the neighbouring counties of Leicester, Oxford, and Northampton. The work of all former botanists down to date will be fully used, and, judging by some portions of the book which we have been privileged to see, we have no hesitation in saying this new work will be the standard *Flora of Warwickshire*. The geology of the county will be described by Mr. A. BENARD BADGER, B.A., BRADFORD-COTTIS Scholar, Oxford. The book will be published by subscription, price 12s. 6d. per copy, and will be limited to 500 copies, each of which will be numbered and signed. Intending subscribers should forward their names to Mr. J. E. BAGNALL, A.L.S., 84, Witton Road, Aston, Birmingham.

"THE TROPICAL AGRICULTURIST," published in Ceylon by Messrs. FERROUSO, of Colombo, monthly, comprises a series of extracts and original articles relating to economic botany and cultivation, of great use to growers in hot countries. A monthly supplement is now added, consisting of articles on the elements of vegetable physiology, economic entomology, and other subjects likely to be of service to agriculturists.

CYCLAMEN EUROPEUM.—According to a paragraph which is going the round of the Press, "the Prefect of Savoy" has prohibited the gathering of *Cyclamen* in the woods of his department. It would be well if the lords-lieutenants of counties had similar power here to ensure the preservation of Ferns and Primroses.

ROYAL COLLEGE OF SCIENCE, DUBLIN.—Mr. THOMAS JOHNSON, Demonstrator in Botany at the Normal School of Science, South Kensington, has been appointed Professor of Botany at the Royal College of Science, Dublin, in place of the late Dr. McNAN.

GHENT CHAMBRE SYNDICALE.—At a meeting held on April 7, First-class Certificates were awarded to Pandanus Trojanowski, from M. A. Van Geert; to *Azalea indica* Mdlle. Louise Cuvelier, from M. J. De Kneef; to *Eoonymus japonicus microphyllus variegatus*, from M. A. Dalliere; to *Pandanus glaucus*, from M. Spac-Vander Meulen; to *Epidendrum Wallisi*, from M. A. Van Imeschot; to *Genista Andreana*, from M. Ad. D'Haene; to *Odontoglossum* species, *O. triumphans*, *Cattleya Mendelii* var., and *C. Warcewiczii* var., from M. Jules Ilye.

PRESENTATION TO MR. R. DEAN.—At the beginning of the present year Mr. R. DEAN resigned the office of Hon. Secretary to the Ealing, Acton, and Hanwell Horticultural Society, which he had held for a period of fourteen years. In order that some suitable recognition of Mr. DEAN'S services to the Society during the past nineteen years should be made, a Committee was formed to obtain subscriptions, so that an appropriate present should be given to him, with the result, that on the evening of the 22nd inst. a number of subscribers to the fund met at the London and County Bank, and Mr. ROBERT WILLEY, on their behalf, presented Mr. DEAN with a gold keyless English lever watch, by BENSON, of the value of £20, and Mr. G. F. NIXON a purse of sovereigns, both gentlemen bearing testimony to Mr. DEAN'S services to the Society. A suitable acknowledgment was made, and the proceedings closed with a hearty vote of thanks to the Committee.

ANEMONES.—Some beautiful St. Bridgid's Anemones, large, and varied in colour, and showing extraordinary vigour, reach us from "St. Bridgid's" Irish garden.

BIOGEOGRAPHICAL INDEX OF BRITISH AND IRISH BOTANISTS.—From the *Journal of Botany* for April, 1890, we transcribe the following names from the "Biographical Index of British and Irish Botanists," compiled by JAMES BRITTON, F.L.S., and G. S. BOYLE, F.L.S.—

"ORDWAYN, THOMAS (fl. 1597). Nurseryman of Newark. "Flora Nottinghamiensis," 1597. Pritz. 237; Jacks. 258.

"PAGE, WILLIAM BRIDGEWATER (fl. 1817). Nurseryman of Southampton. "Prodromus of Pl. in Southampton Bot. Gard.," 1817. Pritz. 239; Jacks. 415."

"PARKINSON, JOHN (1567-1650): b. Nottingham (?), 1567; d. London, Aug. 1650. bar. St. Martin's-in-the-Fields. Apothecary, King's Herbalist (Botanicus Regius Primarius). "Paradisus Terrestris," 1629; "Theatrum Botanicum," 1619. Had a garden in Long Acre. "Theatrum," 639. Pult., i., 134; Ross; Pritz., 240; Jacks., 589. London. "Arboretum," 49, 53; Journ. Hort., xxviii., 1875, 493; with portr. Portr. by C. Switzer in "Paradisus;" and one by W. Marshall in "Theatrum;" re-engraved in Richardson's Illustr. to Granger. *Parkinsonia*, L.

"PARKELL, RICHARD (d. 1882). b. Devonshire; d. Edinburgh, 1882. Ichthyologist. M.D., F.R.S.E. Orig. Membr. Bot. Soc. Edin., 1834. Lived in Jamaica, 1839. "Glasses of Scotland," 1842; "Glasses of Britain," 1845, both with figs.; drawn and engraved by himself. Pritz., 241; Jacks., 589; Journ. Bot., 1883, 39; R. S. C., iv., 763. Herbarium of Grasses at Linn. Soc. *Poa Parkinsonii*, Bab.

"PARRY, CHARLES CHRISTOPHER (1823-1890). b. Admington, Worcestershire, 25th Aug., 1823; d. Davenport, Iowa, 28th Feb., 1890. Went to America, 1852, M.D., Botanical explorer and collector. On Mexican Boundary Survey, 1850; in Rocky Mountains, 1851. Botanist to Agric. Dept. Washington, 1869-71. "Chorizanthe," 1884, 1889, and various botanical papers. Friend of Torrey and Gray. Herb. at Devonport Acad. Nat. Sciences. Jacks., 589; R. S. C., iv., 767; vi., 565; "Garden and Forest," iii., 129; Bull. Torrey Bot. Club, March, 1890. *Pinus Parryana*, Engelm.

"PATTON, GEORGE (1803-1869). b. 1803; d. Glenalmond, Perth, 30th Sept., 1869. Lord Justice Clerk of Scotland, 1867, as Lord Glenalmond.

Chairman, Oregon Bot. Assoc. Introduced *Cupressus Lawsoniana* and *Abies Pattoniana*, Gard. Chron., 1869, p. 1043."

"PAXTON, Sir JOSEPH (1803-1865): b. Milton Bryant, Beds., 3rd Aug., 1803; d. Sydenham, 8th June, 1865. F.L.S., 1833. Foreman, Chiswick Arboretum, 1824. Superintendent, Chatsworth, 1826. "Magazine of Bot.," 1834. Travelled through S. Europe and Levant, 1838. "Pocket Bot. Dictionary," 1840. Knighted, 1851. M.P. for Coventry 1834. Pritz. 212; Jacks., 500; Proc. Linn. Soc., 1865-6, lxxxii.; Gard. Chron., 1865, 534; Journ. Hort., viii., (1865), 446, with portr.; and ix., 12. Journ. Bot., 1865, 231. *Paxsonia*, Lindl.

"PAYNE, RICHARD (d. 1868): d. Panama, 19th July, 1868. Of Stoke, Devonport. Collector for Messrs. Veitch & Bull. Plants at Kew and Brit. Mus. Journ. Bot., 1868, 320; Gard. Chron., 1868, 874, 893; Journ. Bot., xv., (1868), 131. *Stematanthus Paynei*, Hook. f.

"PENNY, GEORGE (fl. 1888 or 1830). Nurseryman, of Epsom, Surrey. A.L.S., 1829. "Hortus Epsomensis," Proc. Linn. Soc., i., 166."

PLANT PORTRAITS.

ANDRHEMUM SUPERBICORNIS VAR. **MAXIMUM** ALBUM, *Lindley*, t. 100.—Sufficiently described by its name.

BIGNONIA ADONIS, *Revue Horticole*, April 1.—A hybrid between John Hale and a tuberous-rooted variety.

CIANTHUS DAMPFI VAR. **MARGINATUS**, *Garden*, March 29, 1890.

CELOSYNE CRISTATA, *Revue Horticulture Belge*, April.

CYPRIPEDIUM LAMBERTI SUPERBUM X, *Orchard Album*, t. 400.—A cross between the var. superbum of *C. barbatum* and *C. insigne*.

CYPRIPEDIUM SILVENS X.—A cross between *C. insigne* var. *Maioli* and *C. villosum*, *Lindley*, t. 225.

LETTIA PENULA and **L. PENULA** VAR. **DAVANA**, *Gesneriobolus*, April 1.

LEPISMIUM DISMILE, *Cactaceae*, *Gartenflorist*, March 15.

ODONTOGLOSSUM BODDARTIANUM, *Lindley*, t. 231.

ODONTOGLOSSUM LEPTOPHYLLUM VAR. **SCRIPTUM**, SUB VAR. **MASKRELIANUM**, *L'illustration Horticole*, t. 99.—A form like *O. l.-p. scriptum*, but without any purple spots.

ODONTOGLOSSUM ACUMINUM, *Lindley*, t. 224.

STREPTILARIA STREPTICANA, *Revue de l'Horticulture Belge*, April 1.—Flowers deep orange, with a yellow lip.

STRAWBERRY TREE BEBWA, *Canadian Horticult. List*, March.

HOME CORRESPONDENCE.

THE JAPANESE ANEMONES.—A few years ago I went into a large nursery near London, and saw several large beds of the varieties of *Anemone japonica*, and I was then told there was no sale for it. These useful Anemones, like some other things, have had to pass through a season of comparative neglect; but there are indications that it is again being sought after. For missing it would be difficult to name another free-growing hardy perennial, and it is not at all fastidious as to position or soil. As far as my own experience goes, it appears to do better in a stiff cold clayey soil on a north aspect rather than in a lighter soil and warmer position on a southern one. Therefore it is, it can be recommended for planting in out-of-the-way spots, for it does not mind being under trees and in the shade. But to see either of the forms at their best, clumps should find a place in the herbaceous border, and be well cultivated. One of the pleasing evidences of our system of modern gardening is not only the growing popularity of hardy perennials, but also the fact that they are better cultivated than they used to be. The Japanese Anemones die down late in

the autumn, and, save for the decaying flower-stems, the plants are almost hidden from view. It is then a good mulching of leaves and manure should be given them, after previously slightly forking over the surface. It is of no matter that a few small root-growths are disturbed, as the plants send down strong tap-roots deep into the soil, as any one can ascertain by attempting to dig up a well-established clump. Such a mulching is of immense benefit to the plants, and fine flowers reward the cultivator; and as it is a plant that grows largely upon the resources of the soil, this mulching should be applied annually. The Japanese Anemone appears to be highly sensitive in the matter of exposure; the smallest rootlet almost will make a plant, and in a short time a big clump is formed. The species does not, to my mind, receive the attention it deserves; the flowers are large, handsome, and deep coloured, and it is of dwarfier growth than the rose-coloured or white forms. It does for an edging to beds of the latter, and my experience of it is that it is also more persistent in a cut state. The flowers of all are borne on long stems, and they are well adapted for vase decoration and other uses. R. D.

RAPID APPLE-STOCK BUDDING.—Mr. Arthur Wm. Edwards record, in your last issue, of Apple-stock budding at the Stamford Nurseries is very interesting to all practical budders and grafters, and would be more explicit if the length of the day occupied in the work was specified. At day-work ten hours is the recognised time, but when men are at piece-work they often extend it one or two hours. Mr. Edwards does not specify whether A. Hagger collected his own buds, or whether they were carried to him where he was at work, nor does he state whether he tied in his buds, or was assisted by a tyer. These are details in the process of grafting which need be specified before a definite decision can be arrived at as to the speed of the operator. A good budler or grafter should be able, with the assistance of prepared buds, or grafts, and a tyer, to place 150 buds, or grafts, in an hour. This may appear—and is—fast work, but there are many expert hands who can accomplish it. I witnessed a workman's skill in this respect this grafting season, and he placed 100 grafts in thirty minutes. The success of the buds, or grafts, depends upon the health and good condition of the stocks, which should always be a little more advanced in growth than the scion, care and attention being paid to the sharpness of the knife used, and to placing the scions so that the bark of both should meet on one or both sides. To bud or to graft there are three or four distinct cuts to be made in different directions, so that Mr. Hagger deserves much credit, even if he had assistance; but if he performed the whole of the operation single-handed, he deserves to be classed with Henderson's (of New York) Irishman, who is reported to have potted 11,000 plants in one day. An Old Gaffer.

TOMATO SEED.—In answer to your correspondent, "A. D.," I venture to offer my experience upon this subject. A Tomato ripened out-of-doors gives a larger quantity of seeded than a fruit of the same variety perfected under glass, but the plants raised from it do not come so true as those from house-grown seed; more, however, depends upon the variety than anything else. My Conference seed was ripened under glass, and every seed appeared to come up readily. It was the same with *Pelude*, one of its parents, Tennis-ball, Nesbitt's Victoria, and Chemin, whilst seed saved from indoor and outdoor specimens of *Perfection* have, in each case, germinated slowly, or not at all, and the plants grew unquiescently. My Ham Green Favourite seed has not germinated so well this spring as it did the last, and it is the same with *Delham Favourite*, *Blenheim Orange*, and *Orange Queen*. There is a tendency in all the best Tomatoes to become seedless, and many of the seeds are merely rudimentary. The *Blenheim Orange* Tomato, which is of very superior quality, furnished me with very few fertile seeds. The *Conference* Tomato is a good early variety, and bears abundantly. It is well suited for pot-culture. W. R., *Streatham Hill*.

THE PROMISE OF THE PLUM CROP.—As I look out from my working table southwards, there comes into the line of sight a plantation of some 400 fine young standard trees of *Victoria* Plums, literally loaded with blossom, and promising an abundant crop. An examination of the flowers shows they are

large, finely developed, and the prophesy of fruitfulness appears to be written large upon the snowy petals. Alas! there is no knowing what fierce trials the crop will have to pass through ere the closing days of May come round. Twice in a year these Victoria Plums put on this apparel of snowy whiteness, viz., now, at the period of flowering, and again in winter, when the soft fleecy snow falls upon the branches, and robs them in a dress of feathery whiteness. Last year these trees flowered fairly abundantly, but bore very little fruit—not so much, apparently, because the frost destroyed the promise of a crop, but because there seemed to be a weakness in the blossoms which did not result in fruit-production. I have not seen the standard Green Gage Plums in this part of the country producing such an amplitude of blossoms as they do this season; the branches are literally wreathed with white flowers. This is true also of the old Orleans. Large trees of Prince of Wales and Pond's Seedling are also profuse of bloom; and so, should the elements be merciful, a really good crop of Plums may be looked for; but cold storms of rain and hail by day, with frosts by night, are not of a nature to re-assure the apprehensive fruit cultivator. He may exclaim, with fervour, "Oh! that the elements would be merciful!" but inexorable laws appear to be destitute of bowels of compassion, and the appeal is made in vain. *R. D.*

CANFORD MANOR GARDENS.—When walking over Lord Wimborne's extensive gardens a few days ago with Mr. T. H. Crisp, the head gardener, many things of interest were noticed, and more than a few improvements which have lately been carried out. The terrace beds, which were formerly too flat, have been raised, and just before the visit of H.R.H. the Prince of Wales, they had been very tastefully planted with a selection of dwarf Conifers, Vines, &c., the golden, red, and varied tints of foliage showing up with a very pleasing effect. With the beds so well furnished, the grass just taking on its spring-like greenness, and the gravel paths in a clean and hard condition, the terrace, and indeed, the whole surroundings, at Canford, really looked charming on the afternoon of my visit. I may mention that there are some very fine specimens of Conifers on the lawns at Canford. The glasshouses have lately been repaired and re-painted, and look nice and clean, and the condition of the occupants proves Mr. Crisp has accomplished much good work during the short time that he has had the entire management of the garden. A house of pot Roses was furnishing plenty of cut bloom, and the Calanthes, which have a house almost to themselves, very promising. In the front range of glass, several changes are contemplated, and, among others, the Fig is to be more extensively grown. The Peach trees were well furnished with fruit, and the Vines looked promising. With the exception of Orchids, Canford is a fully representative garden, but these are being worked up, and much attention is paid to the Orchids already there. *T. Fisher.*

FUNGUS FOUND ON NASTURTIUM.—The enclosed fungus I do not remember to have seen before, or anything like it in colour. It was growing on the stem of a Nasturtium speciosum, about half an inch from the soil in the vinery. *D. D.* [The name of the fungus is *Agaricus argenteus*; it is not uncommon. The blue-green colour of the cap is not very common amongst fungi. This fungus grows on the ground, and it must have got "half an inch" out of the soil and on to the Nasturtium stem by some accident; the fungus is very ubiquitous when young, and will stick to anything. *W. G. S.*]

RAILWAY CHARGES FOR VEGETABLES FROM CORK TO LONDON.—Does market gardening in Ireland pay? According to my experience it does not. This day I sent three heads of Broccoli, packed in a basket to London *via* North Wall, and for which I paid charges to the amount of 5s. This seems to be an enormous price to pay for the carriage of so small a package of vegetables. I am sure that the quantity put into the basket could easily be partaken of by three ordinary diners. *Wm. Bayler Hayland, Ard-Cucin, Cork.*

LITTERING DOWN THE STRAWBERRY BEDS.—This kind of protection and manuring combined is very generally left till it is too late for the plants to have the full benefit of the operation, as when the straw or litter is not put on early, much of the moisture has evaporated, and instead of surface-roots being plentiful they have not put forth, or if they have, it has been only in a small degree, and it

naturally follows that the flower-spikes are weaker and the fruit smaller than when mulching has been early. To obviate these evils, the beds should be lightly hoed at once, to kill weeds, and as soon as that is done, it is a good plan to give a sprinkling of mixed soil and lime, which checks or destroys slugs, and then the beds should be strawed down; the rains will cleanse it, and the moisture will be retained instead of being evaporated. Not only is much benefit derived by early littering, but at this season the work may now be done in much less time than when the foliage is larger, or the plants in flower. *J. S.*

WALLFLOWERS.—Except when unusually severe weather has cut up the blood-red Wallflower severely, I have never seen them blooming in worse form than this year. It is somewhat odd that, whilst yellows should seem impervious to the cold, the reds have done so badly. The best preparation for an early and abundant supply of good market bloom, is found in a warm, dry autumn. The greater portion of the autumn of last year was unsettled and moist, so that the growth was neither stout nor firm. Possibly the very sharp frosts which took place before Christmas last did injure the shoots somewhat, because following so closely upon the dull autumn. In any case, during the winter and spring the bloom yield has been comparatively poor, and devoid of the customary rich colour; the petals small and irregular, the spikes badly developed. In this district, where Wallflowers, to afford market flowers, are grown by almost hundreds of acres, the nature of the bloom, and especially its earliness, are matters of the first importance. The plants are usually put out in June, and in well-manured soil; that given, a good season, they make big clumps before the winter arrives. The object of the grower is to secure early winter bloom as a dibbling bloom, although the winter gets better than does a glut in the spring. All the same, very early got out plants are likely to suffer more from frost than are later planted ones. Whilst there seems to be but one variety of the dark red Wallflower, though known under diverse names, there is greater variety amongst yellows, but these are not at all popular as market Wallflowers; generally they do not bloom so early as the dark red, which seems to have been educated in precocity. The tallest yellow is one oddly enough named Golden Tom Thumb, but it grows some 12 inches in height; it is a fine variety for cutting from. Then comes Bedford Yellow, dwarf, compact, rich orange-yellow in colour; a continental yellow, often sold as Belvoir Yellow, but it is too tall, and the true Belvoir Yellow, which should, when in bloom, not exceed 9 inches in height. *A. D.*

THINNING OF VEGETABLE CROPS.—Advantage should always be taken of showery weather to thin all kinds of sown vegetables as soon as the seedlings are large enough to draw, and it is better to do this necessary operation twice, the first time thinning out the seedlings to 3 or 4 inches in the rows, and subsequently drawing every other plant or more, if every fine specimen are desired; however, 3 inches will be enough space to allow between Onion plants in the row, for bulbs for ordinary kitchen use. In thinning the crops of Carrots, Onions, Parsnips, &c., vacant spaces in the rows should be made good by transplantation of the young plants to the same depth in the ground as they were before; and in the case of Onions, cutting back the straggling roots to within 1 inch of the bulb before doing so. Beetroot will also transplant well, but in this case the roots of the individual plants should be planted without any mutilation, and care taken not to bend them in planting. *H. W. B.*

ANEMONE FULGENS.—Mr. Tomkins says, on p. 413, "Cultivated roots cannot be depended upon after the second year." If it were possible for him to give me a call, I could soon prove this to be a fallacy as regards this part of the country. In the gardens of T. H. Burroughes, Esq., at Ketton Cottage, near here, may be seen a very fine collection of the different varieties, some of them in very large quantities. On a bright sunny day, when the flowers are open, they are a splendid sight, and I know of no other hardy spring flowering plant that would give results half as good so early in the season; flowers having been gathered ever since last December. Mr. Burroughes has three distinct colours—crimson-purple, salmon, and scarlet—in quantity, and other shades in smaller numbers; some very fine double varieties; also the beautiful deep scarlet single variety called *græca*. In Mr. Wolley Dod's communication, p. 424,

this is described as "hardly surviving a cold season;" there is no doubt as to its hardiness here, however, and this is one of the coldest places in the country. All the varieties, however, do well in Mr. Burroughes' hands, and not only in the gardens, for by far the greater quantity is grown in what was until very recently an arable field. They are planted on the side that is sheltered from the north and north-east winds, and are fully exposed to the sun. Very little preparation is made for them beyond a dressing of burnt earth to keep the soil open and porous, and a little manure to make amends for the poverty of the soil, which is a stishful loam full of small pieces of limestone, and it is naturally wet and cold in winter, and the exact reverse in summer. Mr. Burroughes has grown some of his roots for several years, and does not find that their flowering qualities deteriorate, but on the contrary the plants gain strength. As seen as I saw them to-day (April 19) from a distance, they look almost like a patch of scarlet Poppies in full summer. Small bunches of some of the most distinct varieties in this collection were exhibited in the vinery at Chiswick, on the occasion of the Daffodil Conference, and if some bunches had been placed among the Daffodils, they would have afforded a great contrast of colour and relief to the eye, showing off the Daffodils to greater advantage. *H. H. Divers, The Gardens, Ketton Hall, Stamford.*

PRICKING OFF SEEDLINGS.—Those gardeners who do not prick off young plants of various kinds of vegetables usually sow the seeds thinly in drills or broadcast, so that crowding before planting out is obviated. On the contrary, where pricking out is adopted, the plants should be pricked out before they become crowded in the beds. By so doing, sturdy plants produce satisfactory crops in due time. As soon as the seedlings of Cabbage, Cauliflower, Broccoli, Kale, Brussels Sprouts, and the like plants are large enough—that is, when they have developed two or three proper leaves, they should be drawn up when the ground about their roots is moist, and be pricked out in beds at about 6 inches apart, taking care not to bury the plants in the soil much deeper than they were before, making the soil about the roots fairly firm with the small dibber used in picking out. This work, like the final transplanting, is done best during showery weather, or as soon after rain as the land will bear working. In case the work has to be done in dry weather, the plants should be watered slightly two or three times with a fine-rose pot. Watering will be necessary if the weather prove dry, until the plants have become thoroughly established. *H. H. Wood.*

CELERY.—Celery, like other vegetables that we grow, is becoming in its varieties too numerous. I am altogether averse to those that grow tall, as there is in them much unusable material. The dwarf varieties are more solid than these, and such Celeries as Incomparable or Saurdringham are crisp, and possess a pleasant nutty flavour, and, in my opinion, are some of the best. Veitch's Superb White, which is a little taller, and very compact, with solid stems that blanch a pure white, and are tender and excellent eating, runs these two very close. For late use Standard Bearer has come into favour, it being a sturdy, robust Celery, which stands longer than any other before running to seed. This latter quality is a valuable one, as there has always been a difficulty in bridging the Celery season. To prolong the supply, seed of Standard Bearer may yet be sown under a hand-lift. When the plants are big enough to be pricked out, the operation should be done in a frame, and the plants nursed on so as to get them into the trenches whilst the growing season is still a long one. Some growers are troubled by Celery bolting, which generally arises from one of two causes, either sowing too soon or allowing the plants to suffer from want of water. Generally it is the latter, as checks received in this way induce premature bolting. Celery when kept properly moist at the roots, grows steadily onwards. This being so, the plants should have a good soaking every week, and frequent sprinklings overhead during the earlier stages. Dwarf Celery needs but shallow trenches, and that is an additional reason why it should be grown in preference to the tall. Some do the sowing up piecemeal, while the plants are growing, and that, as I think, a bad plan, as water can hardly be given afterwards in sufficient quantity to reach the roots, and even if this be done some of the earth must of necessity get carried into the stem. To obviate this, it is better that the earthing be done at once, after growth has almost ceased. *J. Sheppard.*

TRUFFLES—TRUE AND FALSE.

(Continued from p. 429.)

ANOTHER member of the Tuberales is the white Truffle (fig. 84). *Choiromyces meandriformis*, the *Tuber album* of Sowerby. This plant generally grows in open hilly positions amongst Oaks, half buried in stiff soil, and may be found in June and July.

The white Truffle, although described by Mr. Berkeley as excessively scarce, has several times been sent to the *Gardeners' Chronicle* office for a name. It is very difficult to determine the rarity or commonness of some fungi, especially the subterranean species.

The illustration, A, fig. 84, shows one-half an example of the white Truffle. It is a large species, often attaining the size of an ordinary Potato, either a "round" or "kidney." When young the plant is white; at length it becomes pale buff, or brownish. In section B, the flesh is seen to be marbled with brown and white veins. It becomes yellow in drying. When young the white Truffle is scentless, but when mature the odour is very strong, like decaying cheese. An *ascus* with spores is shown enlarged 200 diameters at C, and a single spore enlarged to 500 diameters at D.

The white Truffle somewhat resembles in form and colour *Tuber magnatum*, but it is a very different plant. Owing to this superficial resemblance it is sometimes sold for the latter species. A great deal of deception is used by Continental Truffle dealers, for instance, some of the worthless species are dried, and sold for the better species.

The white Truffle is abundant in some parts of France and Belgium, and it is used to adulterate *poté de foie gras* by the less conscientious makers. Opinions differ greatly as to the value of the white Truffle; it is much esteemed by some, but not generally held in high repute. It has been known to produce unpleasant symptoms when eaten in a raw state.

The Truffle, so frequently referred to by classical authors, embraces several species, as the brief descriptions clearly show. *Terfezia leonis* is certainly one species referred to, as the peculiar habitat on the sandy sea-shore is mentioned. This species resembles a Potato in size, form, and colour. When raw, it possesses a soapy, but somewhat sharp taste. When soaked in oil, it is highly esteemed by some, it is at times sliced and mixed with eggs. Some persons consider it delicious in a raw state. It grows in Sandy Pine woods, and in the sands of the sea shore in southern Europe and in Asia and Africa, and is eaten as food in Italy, Sicily, Syria, North Africa, and other places.

It is remarkable that the mature growths of Truffles are generally found nearest to or actually upon the ground surface; the deeper examples are generally immature. W. G. Smith, *Itinéraire*.

(To be continued.)

SOCIETIES.

ROYAL HORTICULTURAL.

APRIL 22. There was a large display of plants at the Drill Hall, James Street, W., last Tuesday, when, in addition to the exhibits before the several committees of the Royal Horticultural Society, there was also the show of the National Auricula Society, which of itself formed a large exhibition, and was, indeed, larger than it has been for some years past, and occupied about twice as much space as last year. It was also very gratifying to see a large attendance of visitors, and during the afternoon the hall was crowded. The Rev. C. Wolloley Dod gave a very interesting lecture on Primulas, speaking of the cultural peculiarities of the best known species, and lovers of this charming genus of rock-garden plants will doubtless learn many valuable hints from this lecture when it appears in the *Journal* of the Society. Mr. Dod called atten-

tion to the methods of root-growth of the different species, pointing out how that should regulate their cultivation, and referred to the article by Dr. Masters on that subject, which was read before the Primula Conference of 1886, and appeared, with illustrations, in the *Gardeners' Chronicle* for April 24 of that year. The lecturer advised growing from seed which should be sown as soon as ripe. The varieties and hybrids of *P. acutis* are easy to cultivate, and are of more value than any others to the gardener. Root-stocks should be reduced as much as possible, and divisions should frequently be made, as otherwise the young roots could not push through the mass of dead tissue to the outside soil, as so the plants died. *P. rosea* was of very easy cultivation, if this point is remembered. Mr. Dod showed specimens to illustrate these points. The species *calycina*, *Auricula*, *Cusiana*, and *intermedia* were of the most easy cultivation by any one. The Primulas of the Caucasus and Asia were generally disappointing. *P. elatior*, for instance, was not so good as our native *Cowslip*.

FIG. 84.—WHITE TRUFFLE, *CHOIROMYCES MEANDRIFORMIS*.

The Himalayan species cannot stand sunshine. Speaking of *P. denticulata* and *P. capitata*, Mr. Dod said that to a cultivator there was a great difference between them, the latter was of much more easy cultivation.

Before Mr. Dod's lecture, Sir Trevor Lawrence, Bart., M.P., the President of the Society, performed the pleasing ceremony of presenting, on behalf of the Veitch Memorial Committee, a Silver Veitch Memorial Medal to Mr. David Thomson and to Mr. Bruce Findlay. He spoke of Mr. Thomson's high attainments in all branches of horticulture, and also of the books he had written on the subject. In replying, Mr. Thomson said that he felt greatly honoured in being the recipient of such a distinction, he had been in private gardens all his life, and had served seven employers, and that he had no greater ambition in life than to be a successful servant.

The President, in handing the Medal to Mr. Findlay, adverted to Mr. Findlay's success at Manchester, and in reply Mr. Findlay alluded to the high aims and national importance of Horticulture. Not one of the speakers could be heard

a yard from the table. The Society should take steps to procure a screen, such as was formerly in use at South Kensington, while a raised desk on which the speaker could rest his notes without depressing his head would also be advantageous.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. S. Hiltner, H. Horst, B. Findlay, E. Molyneux, J. Walker, F. W. Burbidge, F. Ross, W. C. Leach, H. B. May, C. T. Drury, H. H. D'Ounbran, T. Baines, C. Noble, H. Cannell, J. Paul, J. Fraser, H. Turner, W. Holmes, and C. Nicholson.

An extensive group of plants was staged by Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, N., a fine display being made by sixteen well-flowered Civeas, the varieties *Scarlet Perfection*, *Ambrise Verschaffelt*, and *robusta* being most noticeable. Plants of *Spiraea asterioides* and dwarf *Rhododendron Williamsii* with numerous moderate sized trusses of flowers, white with the faintest trace of purple and a yellowish throat, were also very effective. A collection of dwarf *Amaryllis* was also contributed, and included a very dark coloured variety, *The Mahdi*, the flower of which is also of good regular form.

A collection of plants from the Royal Gardens, Kew, contained some rare specimens, and excited considerable interest; foremost was a flower of *Aristolochia Godeiana*, 1 foot in diameter, and twice as long (see fig. 85), pale yellow veined inside with chocolate; *Amberstia nobilis* with brilliant rose-flesh flowers relieved by a spot of pure golden yellow, a most conspicuous object. *Cyrtanthus obliquus*, with a scape bearing some half-dozen orange-yellow and green variegated flowers, each about 1 inches long; *Stropeolium azureum*, with delicate blue flowers; *Crinodendron Hookerianum*, a rich red; other plants being *Ataccia cristata*, *Echium callithyrum*, *Boschia stenophylla*, *Burmangia sanguinea*, *Viburnum plicatum*, *Streptocarpus Duddi*, *Flora multiflora*, *Narcissus Barvardii*, wild from Biarritz; *Rhododendron Falconeri*, *R. arboreum* and yars., with a comprehensive collection of species of *Urnula*.

Messrs. Paul & Son, Old Nurseries, Cheshunt, contributed a group of hardy herbaceous plants, in which were cut flowers of *Dianicum plantaginum*, *Tulips*, *Anemones*, the common *Fritillaria*, *Fritillaria uniflora lilacina*, *Eupatorium rubrum*, a pretty little shrubby plant; *Sanguinaria canadensis*, and some alpine Auriculas, the best being *Thos. Moore*, Mrs. Llewellyn, King of the Belgians, and *Diadem*.

A group of well-grown Ferns came from Mr. H. B. May, Dyson's Lane Nursery, Upper Edmonton, N. *Adiantum*, which were largely predominant, included the best species, as *Veitchii*, *Pacotii*, *Rapierii*, *fragrantissimum*, *Fergusonii*, *mundulum*, &c.; also *Pteris serrulata*, and the finely-crested *P. s. nobilis*; *Nephrolepis davallioides plumosa*, a heavily crested form of much elegance, and quite new; *N. cordifolia compacta*, with fronds about 6 inches long, were among other species.

Messrs. Ryder & Son, Sale, near Manchester, staged a large collection of beautiful varieties of *Primula Sieboldii*, in diverse colours and forms, such as were shown last year. The varieties were grouped in circular patches in a bank of *Adiantum*, which added greatly to the beauty of this charming species. We have before had occasion to refer to these varieties, and only now select those to which Certificates were awarded, viz., *Distinction*, shaded crimson, paler towards the centre, and cut edges; and *Bruce Findlay*, of a slaty-lilac colour. Not the least pleasing feature in several varieties is the lacinate margin of the petals.

Messrs. Jas. Veitch & Sons, Royal Exotic Nursery, Chelsea, S.W., contributed specimens of *Chionanthus virginica*, laden with its tassel-like, sweetly-scented, white flowers; this is a very effective hardy ornamental shrub, of much merit. The pretty *Azalea roseiflora*, and a rich rose-coloured *Paeony*, named *Reine Elizabeth*, completed the group.

Rhododendrons were represented by a well-flowered group from Messrs. H. Lane & Son, Great Berkhamsted, in which the following varieties were included:—*Sigismund Rucker*, *Blandyanum*, *Marchioness of Lansdowne*, *Iverestianum*, *Snowflake*, and *Baroness Rothschild*, all with many heavy trusses of bloom. A few hardy *Azaleas* were also included.

The Rev. G. H. Englehart sent a few blooms of hybrid *Narciss*, one of great interest being a cross from *N. poeticus ornatus* and the *Tazetta* variety, *Bazelman major*; the result, named *George Engle-*

heart, is what may be called a bunch-flowered ornatus, but the white of the perianth is tinged with yellow, the cup is yellow, tipped with orange-red. Other hybrids from the same exhibition included Garnet (ornatus and Mary Anderson), which has broad white perianth segments, the cup measuring one-third of the perianth, and is of a brick-red. In a cross between ornatus and Hadibras there is a flower with pure-white perianth and a very much expanded flat cup of pure chrome-yellow.

Daffodils and Narcissus were also shown by Messrs. Barr & Son, King Street, Covent Garden, W.C., and embraced the best varieties. Tulips, Anemones, and Muscari were also included.

Among other exhibits were Mignonette, Garraway's Double White Improved, a strong-growing variety, fully described in the name (which is too long), from Messrs. W. A. Garraway & Co., The Nurseries, Bristol.

Marchal Niel Roses come from Mr. J. Walker, Thame, and from Mr. Shoemith, gr. to — Hodgson, Esq., Shirley Cottage, Croydon, both exhibitors having first-rate blooms.

Mr. J. T. Gilbert, Dyke Bourne, Brighton, had a beautiful intense coloured double Anemone fulgens, and also some Crown Imperials; while a gorgeous show was made by a collection of varieties of Anemone hortensis, from T. H. Burroughs, Esq., 16, Lower Berkeley Street, W., the variety named græca being of the most brilliant scarlet, which was quite dazzling; the flowers, we believe, had been grown at Kelson, Rutlandshire.

A new seedling Primrose was sent by G. F. Wilson, Esq., Heather Bank, Weybridge, under the name of Red Gauntlet—a somewhat curious name for a flower of deep blue with a crimson-purple eye; it is a very richly coloured flower, and is quite novel.

Mr. G. Wythes, Syon House Gardens, Brentford, had a collection of finely-berried specimens of *Pernettya mucronata*; also shoots of *Ruscus androgynus*; the pretty blue Pea-flowered *Clitonia ternata* and *Anthocercis viscosa* with large white flowers.

The brilliant *Ochna multiflora* was shown by Mr. Seabright, gr. to Miss Grinling, Harrow, Weald House, Stanmore, Middlesex.

A pure white Pelargonium was sent by Mr. Simpkins, gr. to R. J. Measures, Esq., Cambridge Lodge, Cumberwell, named Miss F. Measures.

The Rev. W. Wilks, Shirley Vicarage, Croydon, showed blooms of *Narcissus Madame de Graaff*, *Rhododendron niveum* was sent by J. Bateman, Esq., Worthing. Mr. J. James, Woodside, Farnham Royal, Slough, sent flowers of various laced *Polyanthus* (the single flowers were stuck into a bed of green moss, and looked like so many buttons—a stiff unnatural style of display which ought to be discontinued); and from Mr. R. Dean, Ealing, was a plant of *Boscawen's* double yellow Primrose, a fine form.

Orchid Committee.

Present: T. B. Haywood, Esq., in the chair; and Messrs. J. O'Brien, A. H. Smee, M. T. Masters, S. Courtald, F. Moore, L. Castle, H. Williams, E. Hill, J. Domy, H. Ballantine, H. M. Pollett, F. Sander, De B. Crawshaw, J. Douglas, and Baron J. H. Schroder.

Exhibits in this section were not so numerous as usual; perhaps the plant which attracted the most notice was *Cattleya Lawrenceana* var. *Vinckii*, which was sent by Baron Schroder from his collection at The Dell, Egham. The flowers were coloured with crimson-grey, merging into a bluish tinge instead of the rich crimson of the type. The colouring was comparatively less, as the perianth-segments were almost white at the base. The colour is novel and unusual, if not specially pleasing.

Another conspicuous exhibit was *Odontoglossum triumphans* var. *aurea*, the flowers of which are rich yellow, mottled with a paler tint. A specimen of the type and a well flowered example of *Dendrobium thysiflorum* was also contributed by A. H. Smee, Esq., The Grange, Wallington, Surrey (gr. Mr. Cummins).

A beautiful variety of *Odontoglossum Pescatorei* was shown by G. W. Palmer, Esq., Elmhurst, Reading (gr. Mr. Dockerill). The plant had a spike of nine flowers, of the purest white, with numerous medium-sized purple-violet spots over the basal half of each segment. The variety was named Mrs. G. W. Palmer.

From G. Le Doux, Esq., East Molesey, Surrey, came a handsome variety of *Mitonia vexillaria*; the individual flowers measured 4 inches by 3; the large

lip was pure white, and the other parts of the flower faintly suffused with rose.

A variety of *Odontoglossum spectrum*, shown as var. *alba*, was sent by H. M. Pollett, Esq., Fernside, Bickley (gr. Mr. Parkes); this differs from the type in the fact that the yellow ground-colour is replaced by white.

A hybrid *Cypripedium* (*C. Apollo* ×) from *veixillarium* and *Stenei*, was shown by R. J. Measures, Esq., Cambridge Lodge, Cumberwell. The flower retained chiefly the colours of the first-named parent, while the influence of *C. Stenei* was plainly seen in the projecting lip. The upper sepal was vinous-crimson, with darker veins, except down the centre, which was almost green, fading to white at the apex and base; the petals were linear, 2½ inches long, and deflexed, twisted at the apex, where the colour was rosy-brown, the lower portion being yellowish, lined with brown, and slightly spotted with brown-black, the margin being slightly ciliate towards the base.

Messrs. J. Veitch & Sons sent a specimen of the hybrid *Cattleya calumata* × (*Acklandia* × *intermedia*), with prettily-spotted flowers, almost like those of *C. Acklandia*, and a hybrid *Cypripedium* from *philippense* and *villosum*, but which had not taken much of the feature of the former, and is of no great merit.

Sir Trevor Lawrence, Burford Lodge, Dorking, showed a few examples, including a fine spike of *Phalaenopsis grandiflora*, *Dendrobium sulcatum*, and *Oncidium phymatichilum*.

From Malcolm S. Cooke, Esq., Kingston Hill, Surrey (gr. Mr. D. Cullimore), came a small group of well-grown plants, in which were *Odontoglossum Rossi majus*, with very dark brown tints; *Oncidium cucullatum*, and *Odontoglossum nebulosum*; and from F. Lee, Esq., Lynford Hall, Mundford, were flowers of *Cymbidium chloranthum*, pale greenish-yellow, with the column and lip spotted with brownish-red.

Fruit Committee.

Present: Sir C. W. Strickland, Bart., in the chair; and Messrs. P. Crowley, R. D. Blackmore, T. F. Rivers, G. Chife, J. Cheal, G. W. Cummins, A. H. Pearson, G. Bunyard, J. Wright, J. Smith, G. Wythes, J. Hudson, F. Q. Lane, H. Balderson, A. Watkins, David Thomson, and J. Willard.

There were but few exhibits here. Messrs. J. Cheal & Son, Lowfield Nurseries, Crawley, staged a collection of well-kept Apples, in which the best examples were *Curtail*, *Dutch Mignonette*, *Alfriston*, *Brabant belle-fleur*, *Cox's Orange*, and *Betty Gerson*. Mr. G. Wythes had some specimens of forced Strawberries, showing fine fruits of *President* and *Keen's Seedling*, for which a cultural commendation was given. Mr. W. B. Hartland, Cork, sent heads of a large and rather coarse-looking Broccoli, but of good colour, and firm; and Mr. Miller, gr. to Lord Fowley, Esher, sent a basket of Mushrooms.

Awards were made as follows:—

BY THE FLORAL COMMITTEE.

Awards of Merit.

Mignonette Garraway's Double White Improved, from Messrs. W. A. Garraway & Co.

Nephrolepis davallioides plumosa, from Mr. H. B. May.

Rhododendron Williamsi, from Messrs. B. S. Williams & Son.

Primula Sieboldi Bruce Findlay, from Messrs. Ryder & Son.

Primula Sieboldi Distinction, from Messrs. Ryder & Son.

Primrose Red Gauntlet, from G. F. Wilson, Esq.

Narcissus George Engleheart, from Rev. G. H. Engleheart.

BY THE ORCHID COMMITTEE.

First-class Certificates.

Odontoglossum triumphans aureum, from A. H. Smee, Esq.

Cattleya Lawrenceana Vinckii, from Baron Schroder.

Awards of Merit.

Mitonia vexillaria Le Doux's var., from G. Le Doux, Esq.

Odontoglossum Pescatorei var. *Mrs. G. W. Palmer*, from G. W. Palmer, Esq.

Motals.

Silver-gilt Banksian, to Messrs. Ryder & Son, for Group of Primulas.

Silver Banksian, to Messrs. B. S. Williams & Son, for Group of Plants.

Silver Banksian, to Mr. H. B. May, for Group of Ferns.

Silver Banksian, to Messrs. J. Cheal & Sons, for Collection of Apples.

Bronze Banksian, to Messrs. J. Veitch & Sons, for Group of Plants.

Bronze Banksian, to Messrs. H. Lane & Sons, for Group of Rhododendrons, &c.

Daffodil Conference.

THE NATURAL HISTORY AND CULTIVATION OF THE TRUMPET DAFFODIL.*

The hardiest of the hoop petticoats (*N. corbularia*), is var. *citrina*, the only European variety outside the Spanish Peninsula. A line drawn from Bordeaux to Luchon defines its French limits. The white *Corbularia* of Clusius was var. *Grællis*, not var. *monophyllus*, which never occurred in Europe.

Cultivation and naturalisation have made the wild limits of *N. pseudo-Narcissus* difficult to fix. Some very fine forms are naturalised in Ireland, where it is not a wild plant. The friars and monks of the 15th and 16th centuries were also herbalists and physicians, and treating Daffodils for their medicinal virtues, and finding none in Ireland, may have introduced them from the parent institution of their respective orders in Italy, as the Irish varieties are probably of Italian origin.

It is difficult to know by what characters to divide *N. pseudo-Narcissus* into sections. Perhaps colour distinguished them better than size or habitat. It is proposed for convenience to divide the species into five: 1, *Discolor*, including all in which the colour of the crown and the perianth are obviously contrasted in colour, with the exception of one variety; 2, *concolor*, including all those of uniform yellow; 3, *Pallidus*, to which belong all the straw-coloured Daffodils; 4, *albus*, the white flowered trumpet Daffodil; 5, *Muticus*, the cleft-trunk Daffodil; this last not referring to colours, but having very distinct characters, and being the type from which the largest and best of the cultivated forms are developed.

No. 1 is nearly universal wherever Daffodils are found wild. No. 2 is common in Italy and Northern Spain and Portugal, but rare in France. No. 3 extends from the Pyrenees all along Northern Spain into Galicia. No. 4 abounds in the Pyrenees, perhaps is found amongst the Italian lakes. No. 5 has only been found in recent years in the Spanish Central Pyrenees. These divisions can hardly be extended to cultivated Daffodils, owing to the way in which the sections are mixed together by crossing.

Wild hybrids of *pseudo-Narcissus* Mr. Dod divides into persistent and nonpersistent, and also into fertile and barren. The first he mentions, *N. pseudo-Narcissus* × *N. muticus*, occurs sparingly in one spot in the Pyrenees amongst its parents. It is interesting as representing a cross between the extremes of the genus, and affording fair presumptive evidence that any two members of the genus might cross. The question whether *N. incomparabilis* and *N. odoratus*, though recognised as species, were originally hybrids, cannot be considered as settled. They are both very persistent, though odorous is barren. The Portuguese and Spanish *N. Johnstoni* is certainly *N. pseudo-Narcissus* × *N. triandrus*, and shows intermediate characters between the parents—though barren it is persistent. *N. Bernardi*, or *N. pseudo-Narcissus* × *N. poeticus*, can hardly be called persistent, as it has not strayed away from its parents, amongst which it occurs wherever they flower simultaneously. It is remarkable for great varieties of form and colouring, as are also the hybrids raised in cultivation from the same parents.

Speaking of double Daffodils, Mr. Dod considers the question of the single wild Daffodil increasing in size, and becoming double under certain conditions in cultivation, as one which is still open, in spite of the large garden double, and the small wild double belonging to distinct varieties. We cannot always fix the variety to which a double belongs, as they tend to assimilate under similar cultivation. The double called *Telanionus* can be raised from the seed of the single *Tenby* Daffodil, and the *Tenby* has been known to produce a single typical flower, and a double exactly like *Telanionus* on the same bulb. A Daffodil is said to have a good constitution when it endures great changes of soil and

* An abstract of a paper read by Mr. C. W. Dod at the Daffodil Conference, on Thursday April 17, at Chiswick, J. G. Baker, Esq., F.R.S., in the chair. The proceedings on the two first days were recorded in our previous issue.

climate without deteriorating. This is an important factor in judging the merits of a variety. Those which are of a bad constitution are benefited by frequent transplanting. *Dafodils* should be lifted and replanted when leaves become many in proportion to flowers. They do not suffer by being kept two or three months out of the ground, if airy, dry, and warm; but the time for taking up is as soon as the leaves are dead. The same soil does not suit all varieties, and experience must be consulted.

A destructive disease, probably due to adverse conditions of weather or cultivation, rather than to any more specific cause, is very troublesome to growers of the trumpet *Dafodil*. The foliage in early spring becomes stunted and brown, and the bulb is found rootless and soft, and watery between the coats. Gardeners are especially requested to notice all the conditions under which this affection occurs, as it is not unlikely to be due to causes in a great measure preventible.

MARKET DAFODILS.

Mr. Walker, whose farm was described in a previous number, then read a paper on Market *Dafodils*, he pointed out the fact that London was the focus of the market trade in *Dafodils*, and one of the most important questions of the day was what to grow for profit. There is not so great an acreage under *Narcissus* as under other marketable crops, but he questioned whether another crop paid better for its acreage than did the *Dafodils*. They had in past years paid the growers well, and the main question was, would they continue to do so? Calculating the *Narcissus* bulbs in cultivation as 10,000,000 in 1884, he now considered that there would be at least 200,000,000 bulbs in cultivation. Now, would it be possible to make them pay at this increase or rate of progression? The lecturer thought that they would, although since 1884 there had been a fall in prices for flowers of 50 per cent. The minimum price he had received for twelve market bunches had been ninepence, whilst as much as twelve shillings had been received for the same quantity.

The season for *Narcissus* flowers now extends from January to May. Then came the question as to the most popular and profitable of market kinds. Amongst yellow trumpet *Dafodils*, he alluded to *N. Emperor* as superior. *N. maximus* was a good market flower, but had not the best of constitutions. Golden Spur, spurius, Countess of Annesley, Tenby, and Edward Leeds were also mentioned, the last especially for its late blooming habit. Amongst the *N. bicolor* kinds, Mr. Walker stated that at Ham, *N. Empress* was the best and most prolific as a market flower; next came *bicolor*, John Horsfield; Dean Herbert, and *N. bicolor grandis* (now to be known as "Grande"), the latter especially bold, late, of good substance, and an especially desirable variety to grow. *N. Empress* multiplies itself fast, and the offsets, if separated and replanted, rarely fail to bloom; and the solid blooms of *Empress* and *Grande*, if kept over a day or two, do not suffer as do some of the thinner-petalled sorts.

The white *Dafodils* are soft, and do not stand well as market flowers; Madame de Graaf promised to become an exception to this rule, but up to the present it had not become plentiful enough to obtain a fair trial for market culture. Sir Watkin was mentioned as one of the best flowers of its class; and Lady Watkin, if not so big, was even more beautiful, with its orange crown, and it is also a "good doer." This last variety Mr. Walker had first in 1884, and from the produce of the bulb then obtained he had nineteen flowers in 1890.

Hardy conspurcs was especially good, so also Maurice Vilmoren and Wm. Ingram, &c.; and the various *Leedsii* varieties, such as Duchess of Westminster, Katherine Spurrell, Madge Matthews, and Beatrice. The larger *Nelsoni* varieties were also good market bloomers, but the *Burbridge* set generally were not popular; still he grew *Constance*, Falstaff, John Bain, and Mary, amongst others, as being free and distinct. *N. poeticus ornatus*, *grandiflorus*, and *recurvus*, &c., were desirable, as also *odorus*, *rugulosus*, &c.

Among the double kinds, mention was made of Sulphur Crown and Orange Phoenix, the latter being the flower which the Princess Mary of Teck likened to a Tangerine Orange wrapped in tissue-paper.

N. poeticus flore-pleno would be a most valuable market plant if its bulbs could be forced early into bloom, but so far the attempts to do so had failed. What is most desirable in market *Narcissus* are long stems, large flowers of decided colours, and of good

substance, and the bulbs should be robust enough in constitution to succeed in a variety of soils. As it was, no general collection of varieties did equally well in the same soil; and his collection was divided into two groups. The wild or collected kinds were planted on land not manured, after a crop of *Rye-grass* had been taken off, whereas the garden hybrids, &c., did best on well enriched soil.

The double *cernuus* and the pale yellow *Capax*, or *Eystettensis* died out frequently on soils in which *N. Empress* and *N. Emperor* increased fourfold. The plough as a cultural implement beat the spade, and it is possible to cultivate large areas of *Narcissus* at a cheaper and more profitable rate than small plots.

As to marketing, the flowers should be cut in the bud-stage, and opened in water in heat or under glass. *N. poeticus recurvus* could be cut before the bud emerged from the spathe, whereas *N. ornatus* did not open well unless the bud had burst forth from the sheath, and so also the buds of the *Dafodils* should have emerged free of the spathe ere they were cut, and the best results were obtained by cutting just as the perianth segments burst open. These were points of practical detail of importance, and worthy of close attention.

In applying manure, it should be worked deeply into the land, so that the newly planted bulbs did not come into contact with it, but so that the roots would find it as they descended into the soil. Firm soil was also desirable. Mr. Walker believes that by annual replanting, *Narcissus* can be as well grown in English soil as anywhere in the world, and that we can apply any demand for forcing bulbs that may arise either in England or in America.

In the discussion, Mr. C. W. Dod pointed out that in Cheshire and other places in the north of England, *N. Horsfieldii* was a better grower than *N. Empress*, and that it is earlier and larger there.

In the discussion that followed Mr. Dod's and Mr. Walker's papers, it was agreed that as to cultivation and replanting, no general rule would apply to all soils and climates alike, but that replanting should always be done in July to September if the bulbs did badly. Delicate kinds often do better in grass, or among the roots of shrubs and trees; and Mr. Dod especially pointed out the success which attended the planting of *Narcissus* at Elge Hall near walls or rockwork, stones, &c. It was also pointed out that loose soil was inimical to success, especially in the case of wild or collected *Narcissus*; and as to manure, Mr. Burbridge pointed out that, while on dry soils on a well-drained or gravelly subsoil manure might be advantageous, nevertheless on cold, wet, and clay soils its use might be risky and destructive. A question arose as to the failure of *N. poeticus flore-pleno*, a phase of ill-success known as "blindness" often affecting this variety. Mr. Walker said he thought it originated from weakness, and that by adopting annual replanting, not more than 10 per cent. of failures would be found to result. Altogether, Mr. Walker's contribution was a marked addition to the day's proceedings.

At a meeting of the *Narcissus* Committee on April 22, the following two varieties were registered: *Grande*, known formerly as *bicolor maximus*, and sometimes as *bicolor grandis*; and *Queen Sophia*, an incomparably well with widely spreading tinted crown.

Mr. Engleheart showed an interesting set of seedlings, consisting of *poeticus ornatus* × *Bazelman major*, with their flowers exactly intermediate between the two parents, and for which he received a botanical certificate from the Scientific Committee: *ornatus* × *Hudibras*, pure white perianth, with clear yellow widely expanded crown, almost flat; *ornatus* × *Mary Anderson*, pure white perianth with deep red crown; *tortuosus* × *poeticus*, very like the variety known as *Circé*; *John Horsfield* × *ornatus*, near *Humei*; *Arct High* × *ornatus* = an incomparably; and *Leedsii Gem* × *cernuus*, like a white *Ajax*, but flowering three weeks later.

Dr. Wallace sent a lemon-coloured variety of incomparably *plenus*, which was stated to have proved constant since shown last in May, 1887.

National Auricula.

The annual exhibition of the National Auricula Society (Southern Section) took place in connection with the meeting of the Royal Horticultural Society in the Drill Hall, Westminster, on the 22nd inst., and was a very large and interesting one, every section being well represented. Some fine types of show *Auriculas* were exhibited, but not a few

appeared to have felt the late ungenial weather; but the lack of strength on the part of the show *Auriculas* was compensated for by the goodness and quantity of the alpine varieties; and giant *Polyanthus* and *Primroses* were remarkable features. Altogether it was a most satisfactory display, and the large attendance must have been very gratifying to the Council of the Society. The staging and judging arrangements were not what they might have been; and the awards in one or two classes appeared to have been made in a haphazard way, occasioning some grumbling.

Show Auriculas.—The leading class for show *Auriculas* was one for twelve distinct varieties. The Rev. F. D. Horner, Lowells, Burton-in-Lonsdale, Kirby Lonsdale, was placed 1st, with green edges—*Monarch* (Horner), and the Rev. F. D. Horner ("Simonte"), the latter finely developed, and selected as the premier *Auricula* of the show; grey edges, George Lightbody, and Rachel (Woodhead); white edges, Snowdrifts (Horner), Atalanta (Horner), Maspie (Horner), a lovely flower of high quality, and Desdemona (Horner); and the following selfs—*Heroine* (Horner), Laura (Horner), plum-coloured, very fine; Iris (Horner), a beautiful bright purple flower; and *Favourite* (Horner), purple-maroon. 2nd, Mr. T. E. Henwood, Hamilton Road, Reading, who ran Mr. Horner very closely for the premier prize; he had, of grey edges, the Rev. F. D. Horner, *Monarch*, the latter somewhat stale, and *Lancashire Hero* in its grey dress; grey edges, George Lightbody, George Rudd (Woodhead), with ten fine lips, Mrs. Moore (Douglas), and Rachel; white edges, Dr. Kidd, and *Acmé*; and of selfs, Mrs. Potts, Black Bess, and *Heroine*. Mr. Henwood's plants were characterised by a fine bold growth. Mr. James Douglas, gr. to Mrs. Whitbourn, Great Gearies, Ilford, was 3rd; and Mr. A. J. Sanders, gr. to Viscountess Chewton, Brookham Lodge, Cobham, was 4th.

For six *Auriculas* there was, as in the former class, four exhibitors, and here Mr. Henwood was 1st with green edge, Rev. F. W. Horner; grey edge, George Lightbody, white-edged, *Reliance* and Mrs. Darwell (Woodhead); selfs, *Heroine* and Mr. Potts; 2nd, Mr. J. Douglas, with green edges, Rev. F. D. Horner and *Prince of Greens*; grey edge, *Mabel*; white edge, *Conservative* and *Acmé*; and self, *Heroine*; 3rd, the Rev. F. D. Horner.

There were ten collections of four varieties staged: Mr. C. Phillips, Hamilton Road, Reading, was placed 1st with green-edged the Rev. F. D. Horner; grey edge, George Lightbody; white edge, Dr. Kidd; and self, Mrs. Potts. 2nd, Mr. G. W. Wheelwright, Oxford Road, Reading, with green edge, *Prince of Greens*; white edges, *Heather Belle* and *Acmé*; and self, Mrs. Potts. 3rd, Mr. W. Balcock, Oxford Road, Reading.

There were nine collections of two varieties, and Mr. C. Phillips was placed 1st with grey edge, George Lightbody, and self, Mr. Potts; Mr. G. Wheelwright was 2nd with green edge, the Rev. F. D. Horner; and self, Mr. Potts; Mr. S. Barlow, J.P., Stakehill House, Manchester, was 3rd, having a good example of his new green edge, *Greenfinch*, very bright indeed on the petal edge.

In the classes for single specimens, the Rev. F. D. Horner was 1st, with *Emerald*, a seedling of his own raising; Mr. Wheelwright 2nd, with *Colonel Taylor*, unusually dense in the past; and Mr. C. Phillips 3rd, with *Lancashire Hero*.

In the class for grey-edged flowers, Mr. Wheelwright was 1st, with *Mabel*; Mr. J. Douglas 2nd, with *George Lightbody*; and Mr. Henwood 3rd, with *Richard Healdley*.

In the class for white edges, Mr. A. J. Sanders came 1st and 2nd, with *Conservative*, a flower that was in fine condition; Mr. Douglas being 3rd and 4th, with *Read's Acmé*.

In the self class, Mr. Henwood was 1st, with Mrs. Potts; the Rev. F. D. Horner 2nd and 3rd, with *Heroine*; and Mr. Henwood 4th, with *Black Bess*.

Groups of Fifty Auriculas.—As is usual, Messrs. Douglas and Turner were large exhibitors; and the stress put upon the latter was shown by the fact that a very large portion of his plants were of alpine varieties. For all practical purposes, it is a thoroughly useless class, as into it go those varieties which have not enough good quality to enable them to compete in the other classes; and, moreover, only those who grow large numbers can compete in this class.

Alpine varieties.—These, as has already been stated, were numerous and fine, and they were apparently much admired. The best twelve, which came from Mr. T. E. Henwood, consisted of the following varieties

raised by Mr. Turner, viz., Charles Turner, Defiance, Marvel, Phillip Frost, Edith—a pretty white centred variety, Mungo McGeorge, Sunrise, and Miss Blackburn, and the rest, seedlings raised by the exhibitor, were of high promise; 2nd, Mr. C. Turner, Royal Nursery, Slough, also with a very fine lot of flowers, and consisting of Charles Phillips, Olympia, Nemesis—very fine, Troubadour, Jewess, Wrestler, Sunrise, T. E. Henwood, Alarm, Countess, and seedlings; 3rd, Mr. J. Douglas, with varieties of remarkable goodness.

Mr. C. Phillips had the best six, though the selection by the judges was somewhat condemned, his varieties were Diadem, Emperor, Mrs. Dodwell, and the rest unnamed; 2nd, Mr. J. Douglas, with Diadem, Lovebird, Tounours Gaie, and seedlings; 3rd, Mr. G. Wheelwright. The latter had the best four varieties, staging T. E. Henwood, Mungo McGeorge, Rosalind, and Sunrise; Mr. C. Phillips being 2nd, with Edith, Mariner, Pallas, and Sunrise, Mr. W. L. Walker, Bulmishie Road, Reading, was 3rd; the Reading growers thus giving a good account of themselves.

In the classes for single specimens, the best golden-centred flowers were William Coulmer, from Mr. T. Henwood, 2nd, J. J. Colman; and Mr. Wheelwright 3rd, with Hotspur.

The best white-centred flower was Miss Rae, from Mr. C. Turner; Mr. T. E. Henwood 2nd and 3rd, with very promising seedlings.

Polyanthus, gold-laced.—With the exception of a few well-finished plants, contributed by Mr. Samuel Barlow, the varieties were mainly seedlings of a poor character. Mr. Barlow had the best six, staging Prince Regent, Lancer, Exile, Cheshire Favourite, George IV., and John Bright; Mr. R. Dean was 2nd, and Mr. J. Douglas 3rd, mainly with seedlings.

Mr. Barlow had the best three plants, also having Cheshire Favourite, Exile, and George IV.; Mr. J. Douglas being 2nd, and Mr. R. Dean 3rd, with seedlings.

In the class for single specimens, Mr. Barlow was 1st and 2nd with Cheshire Favourite and Prince Regent; and Mr. R. Dean 3rd and 4th with Prince Regent and Sir Sidney Smith.

Polyanthus, giant or fancy.—These were a great feature, the large and brilliant heads of bloom making the gold-laced varieties look very poor indeed; with 12 pots, Mr. R. Dean was 1st with varieties of high quality; Mr. J. Douglas 2nd with some good varieties also; and Mr. W. Harper, Millmead Nursery, 3rd.

Primroses.—These were very bright and fine also. Mr. R. Dean was 1st, with some superb varieties: Brilliant, ruby-crimson; Mr. Gladstone, bright ruby-purple; Samuel Barlow, rich crimson; and Mrs. Gladstone, white. Mr. J. Douglas coming 2nd with well-bloomed plants, a few particularly good varieties being among them. The only exhibitor of double Primroses were Messrs. Paul & Son, Old Nurseries, Cheshunt, who had large pans of platypetala plena, Crossiis, white, lilac, sulphur, and Scotch red, misnamed crimson. Baskets of Primroses were an excellent feature: Mr. R. Dean was 1st, with one containing about twenty plants, the deep yellow varieties being very striking; Messrs. Paul & Son were 2nd, and Mr. W. Harper 3rd.

Fancy Auriculas.—The best twelve plants of these came from Mr. Douglas, who had some very striking golden-edged varieties; Mr. Samuel Barlow was 2nd, and Mr. R. Dean 3rd.

Seedling Show Auriculas.—Prizes were offered for these, but, with the exception of a charming yellow self, named Buttercup, from the Rev. F. D. Horner, there was nothing of importance. Green edges:—The Rev. F. D. Horner was 1st, with Dragon Fly, a somewhat rough flower as shown. Grey edges:—Mr. Horner was 1st, with Irreproachable, a promising variety; and in the white-edged class he was 1st, with Miranda; and 2nd, with Snowdrift—both promising flowers. In the self class he was 1st, with Buttercup; and 2nd with Dimple, a smooth dark plum-coloured variety. A first-class Certificate of Merit was awarded to Buttercup, undoubtedly the best yellow self ever seen.

Seedling Alpine Auriculas.—A 1st prize and First-class Certificate of Merit were awarded to Mr. T. E. Henwood, for Florie Henwood, rich golden centre, shaded with rosy salmon deepening to crimson—a smooth variety of high quality. Mr. J. S. Hedderley, Sneinton, Notts, had a 2nd prize and a Certificate of Merit, which it scarcely deserved, for Jenny, golden centre, and maroon shaded with crimson, but decidedly rough.

The premier Auricula, selected from the whole show, was green-edged, the Rev. F. D. Horner,

shown by Mr. Horner in his 1st prize of twelve show varieties, having eight pips, some of them very fine indeed.

Species of Primulas.—Very good collections of these were staged, and very interesting they proved; it is also satisfactory that more exhibitors are being drawn into the competition. An excellent twelve were staged by Mr. J. Douglas who had large examples of P. Sieboldi laciniata, P. verticillata, P. obconica, P. japonica alba, P. rosea, P. nivea, P. intermedia, P. obtusifolia, P. auricula, P. denticulata purpurea, and marginata cerulea; 2nd, Mr. W. Harper, nurseryman, Guildford, who had distinct from the foregoing, P. involucreta, P. ciliata, var. Crimson King and P. intermedia; O. T. Hodges, Esq., Larchine, Chislehurst, was a good 3rd. Mr. Samuel Barlow had the best six, staging good examples of P. obconica, P. denticulata, P. verticillata, P. intermedia, P. viscosa, and P. vulgaris; Mr. R. Dean was 2nd, having a fine yellow semi duplex form of P. elatior. Altogether it was a most successful exhibition.

ROYAL BOTANIC.

APRIL 23.—The second spring show of this Society would have proved a rather poor affair had it not been for the trade collections. In the competing classes, there seemed to be no energy and interest. Messrs. Ryder & Sons' varieties of Primula Sieboldi attracted much notice on account of their variety of form and colour.

Azaleas were better than usual. Mr. H. Eason, Hope Cottage, Higgate, led in the amateurs' class, with finely flowered plants; Mr. C. Turner, Slough, having the best in the nurserymen's section.

Auriculas were very good. Mr. C. Turner had the best twelve alpine, and also showed a collection.

Mr. J. Douglas led for twelve of any sort, and also for Polyanthus, having well flowered plants. He also led for a collection of hardy Primulas, showing handsome plants; Messrs. Paul & Son, Cheshunt, being 2nd. The same firm was leading for Anaryllis, with twelve well flowered, good coloured varieties, and again for a collection of nine pot Roses.

Messrs. Paul were 1st, having plants in their usual good style; Mr. Kumssey, Joyning's nursery, Waltham Cross, being a close 2nd.

Cinerarias were best from Mr. D. Phillips, Langley Broom, Slough, who had a nice lot of Cinerarias, and another of Pelargoniums, being placed 1st in each class.

Hardy herbaceous plants were very good, Mr. T. S. Ware showing a nice collection, for which he was awarded the 1st prize. Primula Sieboldi vars. were good.

A collection of alpinas came from Messrs. Paul & Son, and received 1st, Adonis vernalis and alpine Auriculas being included; for Anaryllis the same firm led.

Tuberous Begonias were shown by Messrs. H. Cannell & Sons, Swanley, a very showy lot, and were placed 1st.

NON-COMPETING ENTRIES.

From Messrs. B. S. Williams, Upper Holloway, came a group of Chrysan. and Amaryllis, with Rhododendron Williamsii and Spiraea astilboides, and had a Silver Medal awarded.

Messrs. Ryder & Sons, Sale, sent a collection of Primula Sieboldi vars., very pretty, for which a Silver Medal was also given; and a small Silver Medal was given to Messrs. Laing & Sons, Forest Hill, for a collection of miscellaneous plants, with a fine Rhododendron, Countess of Haddington, as a centre-piece; and a large Bronze Medal was given to Messrs. Barr & Son, Covent Garden, and to Mr. T. S. Ware, Tottenham, for comprehensive collections of Daffodils, &c.; a similar award being made to Mr. W. Morle, 283, Regent Street, for a decorative group of plants, containing Palms, Crotons, Azaleas, Ericas, &c.

T. H. Burroughes, Esq., Ketton, Rutland, made a bright show of Anemone hortensis vars., and also had a fine lot of fruits of Bramley's Seedling Apple.

Bronze Medals were also given for fine boxes of Marshal Niel Roses from Mr. J. Walker, Thame, and Mr. W. Robbins, Aylesbury. For a collection of Rhododendrons, Messrs. H. Lane & Son, Berkhamsted, had a Large Bronze Medal; and Mr. Rumsey, Joyning's Nursery, Waltham Cross, Herts, a Silver Medal, for a collection of well-flowered pot Roses; and to Mr. J. Douglas, for a collection of Auriculas and Primulas, a Large Bronze Medal was given. A collection of hardy herbaceous plants,

well flowered, from Messrs. Paul & Son, was awarded a Bronze Medal.

Certificates were awarded as follows:—

Pelargonium Duchess of Fife (decorative), large flower, pure white, with a small delicate purple veining on one petal, from Mr. D. Phillips.

Narcissus Madame de Graaf, from Messrs. Barr & Son.

Narcissus Mrs. G. Cammell, from Messrs. Barr & Son.

Paeony (Tree) Mrs. S. Low, blush pink, fading to white at the tips, from Messrs. J. Laing & Son.

Paeony (Tree) Triomphe de Milan, self rose, paler towards the tips, from Messrs. J. Laing & Son.

Carnation Madame A. Waroquoque, from Messrs. J. Laing & Sons.

Primula Sieboldi lilacina marginata, white, with lilac marginal suffusion, from Mr. T. S. Ware.

Civea ornata, deep-coloured short flower, from Messrs. B. S. Williams & Sons.

Civea Ambrose Verschaffelt, long rich-coloured flower, from Messrs. B. S. Williams & Sons.

Begonia Lord Salisbury, light brick-red, single, from Messrs. H. Cannell & Sons.

Begonia Duke of Sutherland, rich carmine, very bright, single, from Messrs. H. Cannell & Sons.

Mignonette, Garraway's Double White Improved, from Messrs. Garraway, Bristol. (See Royal Horticultural Society's Report.)

Primula Sieboldi alba magnifica, pure white, trilobed and toothed, from Messrs. Ryder & Son.

Primula Sieboldi Ruby Queen, bright rosy-purple, from Messrs. Ryder & Son.

Primula Sieboldi Bruce Findlay, from Messrs. Ryder & Son. (See Royal Horticultural Society's Report.)

Primula Sieboldi Harry Leigh, pale slaty-purple, from Messrs. Ryder & Son.

Primula Sieboldi Mrs. Ryder, white, with pale rose suffusion on the margins, edge crenate, from Messrs. Ryder & Son.

Auricula Magpie (Horner), white-edged, show, purple-black body colour, throat yellow, good paste, from Mr. J. Douglas.

THE NORTH OF SCOTLAND HORTICULTURAL ASSOCIATION.

The monthly meeting of this Association was held in the Upper Hall, Christian Institute, Aberdeen, on Wednesday evening the 16th inst. There was a large attendance. The chief business on the card was a paper on "Daffodils and other Spring Flowers," by Mr. George Leslie, Covent Garden, London, and was read by the Secretary, Mr. W. Reid. In the paper some valuable practical suggestions were made concerning the cultivation of the Daffodil and Narcissi generally, either as border flowers, or for the embellishment of the conservatory or greenhouse when grown in pots. The speaker entered rather fully into the cultivation of the flower in the open air and in pots.

A long discussion followed the reading of the paper, taken part in by Mr. Muirhead, factor to the Earl of Aberdeen, Haddo House; and Messrs. C. D. France, Harper, Cocker, Robson, Edwards, Grigor, and Mr. Smith, the President. All the speakers agreed as to the excellence of the paper; but exception was taken to the statement that manures should be avoided. The members then proceeded to inspect the exhibition, the report of which will be found below.

The Exhibition of spring flowers.—This Society deserves to be congratulated on the magnificent collection of Daffodils, Hyacinths, Tulips, and other spring flowers which were brought together under its auspices in the Christian Institute, Aberdeen, on Thursday, 17th inst. The object in view in getting up the collection is to create and stimulate an interest in spring flowers in Aberdeenshire, which have been to a large extent neglected. This object was thoroughly well attained if the numbers visiting the exhibition be taken as a criterion.

Mr. C. W. Cowan, Valleyfield, Penicuik (near Edinburgh), forwarded a collection of Daffodils, embracing 56 varieties. In this collection, the individual flowers were reckoned much finer and better coloured than in any of the other collections, and as they were grown at an elevation of some 600 or 700 feet above the sea level, they afforded proof of the suitability of the Daffodil for outdoor cultivation in the comparatively exposed parts of Scotland.

Messrs. Barr & Son, London, contributed fifty varieties of the Daffodil, among which was a very

choice selection of the smaller alpine varieties, and a notable display of Anemone fulgens.

Much attention was directed to a large collection of Hyacinths from a Dutch grower, embracing no fewer than one hundred varieties, double and single, all correctly named. This collection showed the best varieties in each class, represented all the shades of colour, and included varieties best adapted for pot culture and culture under glass. There was another exceptionally fine collection from Holland of Hyacinths, Tulips, and Daffodils; but from the fact that the specimens were not named, they did not possess for the visitor the same interest as they would otherwise have done. Mr. Proctor, jr. to Mr. William Henderson, Devonha House, Aberdeen, had forwarded a valuable collection of Orchids and greenhouse plants, for which the Association awarded their Cultural Certificate.

Obituary.

GEORGE FIRTH.—We regret to announce the death of this gentleman, of Manningham Thorpe, Bradford, which occurred at his residence on Thursday, the 17th inst., after a week's illness. Mr. Firth was widely known as an horticultural amateur, and had made a good collection of plants. He was an especial lover of Orchids and hybrid Rhododendrons, and many of his possessions have been noted from time to time in the horticultural press. Local horticultural movements also received much support from him.

GEORGE THURBER.—Beyond the immediate circle of his personal friends and botanical associates, the name of Dr. Thurber is not much known in this country; nor, indeed, do we think it is likely to be otherwise in the United States. For all that, Thurber did excellent work as a botanist, whilst as editor of the American Agriculturist he occupied a unique position, and a lighted and instructed thousands who knew nothing of his personality, and who were ignorant even of the "Doctor's" name. Thurber was born in 1821, and was one of the band of young men (of whom at an earlier period Asa Gray was one) whose good fortune it was to have fallen under the sway of the late Dr. Torrey's influence. Forsaking pharmacy, he was appointed naturalist and quartermaster to the expedition sent out to survey the Mexican boundary, and for four years he was engaged in this occupation, sending his plants to Gray for determination and publication, but himself making a special study of the grasses on which he became an acknowledged authority. On the completion of his duties with the Survey, he occupied himself with lecturing on botanical and chemical subjects at colleges of pharmacy and agriculture.

In consideration of his eminence as a teacher of materia medica, the degree of Doctor of Medicine was conferred on him by the Brown University (New Jersey). In 1867 he became editor of the American Agriculturist, a position he held till a few years ago with singular success. His articles being characterised by science without pedantry, an easy but accurate style, abundant good sense and not a little humour.

A marked trait in his character was his love of children, his great delight being to aid them in their studies or in their childish troubles; and many, who in point of years were not children, relished the "Doctor's Talks," and were glad to obtain their scientific information so pleasantly and at so little trouble. A man of broad sympathies and clear sense of right, he was an ardent abolitionist when such views were not popular with the authorities, and Thurber had to suffer for his addiction to those political views which he had the happiness to live to see fully carried out. Thurber visited this country in 1879, when his abounding kindness, his humour, his real or affected amusement at our backwardness and want of "go-aheadness" were amusingly manifested. Standing one day with the present writer in the Strand, in attire sufficiently unconventional, at least as to his head-gear, to attract the notice of the street boys, he was discoursing on the influence that editors exerted over their readers, and yet,

said he, stopping in the middle of the pavement to enforce his views, if these paving-stones were to suddenly lift themselves and bury us beneath them, this great throng of passers-by would go on their way as if nothing had happened! His letters were excellent specimens of the epistolary art, not frequent, but brim full of information, original views of things, and hearty good feeling. His garden, "The Pines," at Passaic, New Jersey, was a great delight to him, and of value as an experimental garden. By this means, the Doctor was enabled to render great service to Messrs. Woolson & Co., as well as to lovers of hardy plants generally.

JAMES ALEXANDER.—It is with sincere regret that we have to announce the death of Mr. James Alexander, of Redbraes, and partner in the firm of Dicksons & Co., Nurserymen and Seedsmen, Edinburgh, which took place at Hastings, on his way home from the South of France, on the 21st inst., at the early age of 45 years. Mr. Alexander was a native of Banff, and came to Edinburgh in 1853, and was trained under his uncle, the late James Alexander, at that time senior partner in the firm named; and to whose interest in the business he succeeded a few few years ago. Although of a retiring disposition he took a lively interest in everything appertaining to the progress of horticulture, and that at all affected the moral and material well-being of gardeners, foresters, and nursery employes; and contributed liberally and unstintingly to movements organised by them. In the wide circle of his personal friends his sterling worth and kindly nature inspired esteem and affection.

THE WEATHER.

(By the term "accumulated temperature" is meant a figure representing the aggregate amount, as well as the duration, of the sun or sun-dots of temperature above or below 42° Fahr. for the period named; and this combined result is explained in Day-degrees.—"Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.)

Table with columns: INSTRUMENTS, TEMPERATURE (Daily, Accumulated, etc.), RAINFALL, BRIGHT SUN, and Percentage of possible Duration. Rows represent different districts and weather conditions.

The districts indicated by number in the first column are as follows:—

- 1, Principal Wheat producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.

THE PAST WEEK.

The following summary record of the weather for the week ending April 19, is furnished from the Meteorological Office:—

"The weather during this week has been fair and

dry, except over the southern and south-western parts of the kingdom, where after the earlier days it became dull and unsettled, with frequent falls of rain. In many parts of England and Ireland thunder-storms were experienced.

"The temperature" has continued below the mean in all districts excepting the 'Channel Islands,' the deficit ranging from 1° in 'England, S.' to 5° in 'England, N.E.' The highest of the maxima, which were recorded either on the 14th or 15th, varied from 63° in 'England, S.,' and 65° in 'England, E.' and the 'Channel Islands,' to 57° in 'Scotland, E.,' and 52° in 'England, N.E.' Towards the end of the period the daily maxima at all but the extreme western stations were considerably below 50°.

"The rainfall" has been more prevalent in 'England, S.' than it was last week, but less so in all other parts of the kingdom. The percentage of the possible duration ranged from 9 in 'England, N.E.' to 30 in 'England, E.,' and to 18 in 'Scotland, N.'

MARKETS.

COVENT GARDEN, April 24.

We cannot accept any editorial responsibility for the subjoined reports, which, however, are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations represent averages for the week preceding the date of our report. The prices depend upon the quality of the sample, the supply in the market, and they fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as representing the particular prices at any particular date, and still less can they be taken as guides to the prices in the coming week. (E.C.)

The first cargo of Tasmanian Apples reached our market this week in very good condition, the early sales making high prices, but later on prices fell to a more reasonable state. Trade steady, with prices scarcely altered. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing prices for various fruits: Apples, pears, plums, cherries, strawberries, etc.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table listing prices for various vegetables: Asparagus, beans, beet, carrots, cauliflower, celery, cucumbers, etc.

NOTE.—In consequence of colder weather prices for Old Potatoes have had a tendency to rise up to a value of 5s. 6d. per ton in many instances. Arrivals of New fairly heavy, and late prices have been maintained. J. B. Thomas.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing prices for various plants in pots: Aralis Sieboldi, Arum Lilies, Aspidistra, Begonia, Azalea, Camellia, Cyclamen, Cyperus, Delyria, Draconis terminalis, etc.

ORCHID-BLOOM IN VARIETY.

SEEDS.

LONDON: April 23.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, London, describe the seed market to-day as scantily attended, and but a limited business doing. The orders which still drop in are small, and of a retail character. The speculative purchasing of Red Clover seed has caused the article to become very firm, and 2s. more money is now demanded. Cables just to hand report the American markets excited and dearer. Trefoil also is considered worth buying. Fine Alsike is still tending upwards. White Clover is, however, out of the running. Grasses move off freely on former terms. Spring Tares on spot are scarce. Sanfoin is very cheap.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, for the week ending April 19.—Wheat, 23s. 10d.; Barley, 23s. 10d.; Oats, 18s. 6d. For the corresponding period in 1889.—Wheat, 23s. 10d.; Barley, 23s. 1d.; Oats, 17s. 9d.

FRUIT AND VEGETABLES.

SPITALFIELDS: April 23.—Good supplies of all kinds of fresh vegetables. Moderate supply of fruit. Demand good. Very large supply of Potatoes, trade exceedingly slow. Prices.—English Apples, 4s. to 7s. 6d. per bushel; American Apples, 10s. to 25s. per barrel; forced Rhubarb, 1s. 3d. to 1s. 9d. per dozen bundles; natural ditto, 1s. 6d. to 2s. 6d. do.; Cabbages, 2s. to 4s. per tally; Seakale, 1s. 3d. to 1s. 6d. per punnet; Spinach, 1s. 6d. to 2s. per bushel; Sprouting Broccoli, 9d. to 1s. per sieve; do., 1s. 6d. to 2s. per sack; Cauliflowers, 1s. to 2s. 6d. per dozen; French Radishes, 1s. 6d. to 1s. 9d. per tally; Beetroot, 4d. to 8d. per dozen; Greens, 3s. to 4s. per dozen bunches; Carrots, 2s. to 3s. do.; Parsley, 2s. to 3s. do.; Mint, 2s. 6d. to 3s. per dozen bundles; Horseradish, 1s. 1d. to 1s. 4d. per bundle; Mustard and Cress, 1s. 6d. to 1s. 9d. per dozen baskets; Cabbage Lettuce, 1s. 6d. to 1s. 9d. per dozen; Endive, 1s. 3d. to 1s. 6d. do.; Spring Onions, 2s. 6d. to 4s. per dozen bunches; English Onions, 11s. to 12s. per cwt.; Bordeaux do., 6s. 6d. to 7s. per case; Egyptian do., 9s. 6d. to 10s. do.; Carrots, 16s. to 28s. per ton.

STRAFORD: April 22.—Supply has been good during the past week, and a fair trade was done at the following prices: Cabbages, 3s. to 5s. per tally; Greens, 2s. 6d. to 4s. 6d. per dozen bunches; Cauliflowers, 1s. 9d. to 2s. 6d. per dozen; Turnips, 2s. to 3s. per dozen bunches; Carrots (household), 30s. to 40s. per ton; do. (cattle feeding), 14s. to 18s. do.; Parsnips, 25s. to 32s. 6d. do.; Mangolds, 11s. to 17s. do.; Sweets, 16s. to 20s. do.; Onions, Egyptian, 3s. to 4s. 6d. per bag; do. Dutch, 7s. to 7s. 6d. do.; Watercress, 6d. per dozen; Celery, 3s. to 6s. per dozen bundles; Lettuce, 2s. to 3s. 6d. per pad; Radishes, 6d. to 9d. per dozen bundles.

POTATOS.

BOROUGH AND SPITALFIELDS: April 22.—Quotations.—Regents, 40s. to 55s.; Hebrons, 30s. to 40s.; Magnum, blacklands, 35s. to 40s.; Bedford, 40s. to 50s.; Lincoln, 40s. to 50s.; Yorks, 45s. to 75s.; Scotch, 60s. to 100s.; Imperators, 40s. to 70s. per ton.

SPITALFIELDS: April 23.—Quotations.—Magnum, 30s. to 50s.; Regents, 60s. to 65s.; Champions, 30s. to 40s.; Imperators, 40s. to 70s.; Hebrons, 25s. to 35s. per ton.

STRAFORD: April 22.—Quotations.—Scotch Magnum, 60s. to 85s.; do. Regents, 50s. to 70s.; light English Magnum, 45s. to 60s.; dark do., 32s. 6d. to 47s. 6d. per ton.

HAY.

Averages.—The following are the averages of the prices obtained at the various metropolitan markets during the past week.—Clover, prime, 75s. to 92s.; inferior do., 40s. to 75s.; hay, best, 60s. to 87s.; inferior do., 20s. to 50s.; and straw, 20s. to 30s. per load.

NOTICES TO CORRESPONDENTS.

Owing to the large extension of our circulation, we are under the necessity of going to press at an earlier time than heretofore, and request our regular correspondents to favour us with their communications as EARLY IN THE WEEK AS POSSIBLE.

ASSESSMENT OF GREENHOUSES: *Market Florist*. If you will have patience, you will soon be put out of your misery. See article on p. 515 of present issue, on "Rating of Nurseries and Market Gardens."

BOOKS: *A Beginner* will find no one book that will supply him with "coloured illustrations of the various flowering plants, Ferns, &c." Nicholson's *Dictionary of Gardening* (Upcott Gill, 110, Strand, London, W.C.) will give him much of the information he is in need of. *MANUALS: G. C. Canebole Culture for Amateurs*, W. J. May; *Rosery and Strawberry*, D. T. Fish (Bazaar Office, 170, Strand, London, W.C.); *Peaches*, Robt. Smith (Stimpkin, Marshall & Co., London); the *Grape Vine*, A. F. Barron (Royal Horticultural Society's Garden, Chiswick).

CARPET SEEDS: P. J. Messrs. H. Cannell & Sons, Swanley, Kent, will doubtless supply designs.

CONVEY SEEDS: H. J. C. We know of no methods of testing the germinating power of the seeds other than those in use for other seeds.

CROTONS: P. S. Croton house temperature, night 65° to 70°, with a proportionate rise in the daytime. Overwatering the plants might cause the leaves to fall. It is yet too early to shade Crotons, in fact, shade is at all times opposed to good colour in the leaves, and should not be used until the sun gets more powerful than now. Scale insects were in profusion.

CYTISUS LOSING ITS FLOWERS: *Cytisus*. It was doubtless bought when in full bloom, and fresh from a market nursery, where it had received special treatment and some special kind of manure. These conditions fall under your treatment, hence its collapse. Cut it back—each shoot separately to half its length; and when it breaks, repeat it in sandy loam and peat. *Cytisus* will do very well out-of-doors from the middle of June to September in almost full sunshine; but the pot must be plunged to the rim in coal-ashes.

DENDROBIUM LEBRILLIUM VAR. OCELLATUM: *L. L. Bensulis*. A number of two flowers or synanthry. Many thanks.

DOUBLE HYACINTH: *H. H.* When these were grown more frequently than they now are, this change was often met with. It is a reversion to the primitive condition of things.

INSECTED MUSHROOM: *R. P.* A very good illustration of a common infestation. Scarcely a week, at this season, passes that we do not receive one or two specimens. It has frequently been figured. The reason why is not known beyond dispute.

NAMES OF FRUIT: *G. W. O.* Apple *Mère de Ménage*.

NAMES OF PLANTS: *W. Chaffer*. 4, *Abrietta deltoidea* var. 6, *Alchemilla saxatile*. No. 1 is a Polygonatum which, with Nos. 2, 3, and 5, should be sent when in flower.—*D. T.* The publisher is the business manager. The Austrian Pine is covered with fungus (*Peridermium pinis*) to such an extent, that remedy is impossible. Burn the affected twigs as far as you can. 1, apparently *Gaultheria shallon*; 2, *Juniperus virginiana*.—*E. D. L.* 1, *Acer*

platanoides, or one of its varieties; 2, *Acer pseudo-platanus*; 3, *Salix repens*; 4, *Hiippophae rhamnoides*.—*W. H. M.* *Toxicophaea spectabilis*.—*O. Orpet*. 1, *Dendrobium pulchellum* of Loddiges = D. Loddigesii, Rolfe; 2, D. Piarrii; 3, D. cretaceum.—*G. Wood*. 1, *Miltonia stellata*; 2, *Cattleya Forbesii*; 3, *Forsythia viridissima*; 4, *Berberis dulcis*; 5, B. Darwinii; 6, *Rhipsalis salicornioides*.—*T. T. W.* We cannot name garden forms of flowers.—*G. Paul*. *Lathraea squamaria*, an unusual colour.

ODONTOGLOSSUM (=MILTOKIA) VEXILLARIUM: *H. B.* A very brightly coloured form.

ROSES: *J. Edwards*. The blooms were very nice of their kind, especially those of M. Brunner and Dr. Andry.

SEEDS NOT GERMINATING: *T. H.* *Grevillea robusta* seeds should be raised in a greenhouse, or if heat is employed, it should be of a mild nature. Strong bottom-heat sometimes destroys the vitality of the seed, especially if the pots be plunged. *Arabia Sieboldii* grows best in the greenhouse. It takes several weeks to germinate if sown in the early spring. *Mandevilla suaveolens* is a greenhouse plant, and does not require heat at any time. The first two are more satisfactory when sown late in the autumn, and kept in a cold pit, out of the reach of frost, covering the seed-pots with a piece of tile to exclude mice. The seeds will germinate during the winter, and should be potted singly before many roots are made. In sowing seeds of hard-wooded greenhouse plants, the layer immediately under the surface soil, which should be fine, should consist of nodules of peat and loam—or either separately—of the size of Hazelnuts. The roots seize upon these, and upon being turned out of the seed-pots are not entirely denuded of soil, as occurs when finely-sifted mould only is employed, and there is consequently less check to growth caused by the operation of potting.

STOVE: *W. P. T.* The two flow-pipes and the return-pipe should not pass under the bed first, but be carried round the house—or at least the sides and front of it. They may then pass under the bed; but there should be a valve in, and a separate connection with, the return-pipe, just outside the bed, so that when the bed was sufficiently warm the water in the two flow-pipes could be diverted. There must be no valve in the return-pipe.

STRAWBERRY NOBLE: *H. M.* The fine large fruits sent were of very poor flavour, but so have some other early forced Strawberries. We think there are several which are much better, but the market growers will like it, if it sets well, as you say it does, and is robust, and we may expect to see it in quantity in the shops very soon.

STRAWBERRIES: *R. C.* Your fruit arrived in a state of fermentation, so that we are quite unable to advise you.

TRANESES: *H. J. C.* The fungus you send is a *Tranezia*, probably the one you speak of.

For Green and Black Fly, American Blight, Camellia Red Spider, Many Egg, Brown and White Scale, Worms, Wood Lice, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE. SAFE—ECONOMICAL—EFFECTUAL.

15, PRINCES STREET, EDINBURGH, July 15, 1887.—"Dear Sirs, I have thoroughly tested a sample of a new Insecticide which you were so good as to send me. I mixed 1 lb. to a gallon of water at a temperature of 95° F. and it kills Green Fly immediately. In 24 hours the strength, or 2oz. to a gallon of water, will keep the foliage of plants on a low soil, and will kill 3oz. to a gallon of same temperature effectively dissolved in Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect troubles are applied through some orange or garden engine, and a most severe test of efficiency to which I have applied by hand washing or spraying, on many occasions, yours truly. (Signed) A. MACKENZIE, Messrs. Menzies, Macdonald & Co., Glasgow."

Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888.—"DEAR SIR: I have given your Insecticide a trial, and a good trial in competition with many others. I am pleased to say that I have found it to be more efficient in destroying Mealy Bug and other insects than any other we have ever used. It ought to command a good sale. (Signed) B. S. WILLIAMS."

Sold by Corry, Soper, Fowler, and Co., Florists, in Bottles of 1s. 6d., 2s., 4s., 6s., and 12s.; in Tins of 1 and 2 gallons, 10s. 6d. and 20s. 6d.; and quantities of 5 gallons and upwards, 9s. per gallon.

Prepared only by **DUNCAN, FLOCKHART & CO., Chemists to the Queen, Edinburgh.**

May be had from B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from WILLIAM EDWARDS AND SONS, 157, Queen Victoria Street, London.

Great Reduction in Price of **LETHORION (VAPOUR CONE).**

Nothing can surpass this method for the total destruction of Insect Pests in greenhouses. It can be used at all times and in all places where the houses are secure. No possible injury to the plants or the plants. PRICES:—In 1 lb. Tins, 2s. 6d.; 5 lb. Tins, 10s. 6d.; 10 lb. Tins, 18s. 6d.; 20 lb. Tins, 35s. 6d.; 40 lb. Tins, 65s. 6d.; 80 lb. Tins, 125s. 6d. Owing to the enormous demand, intending buyers would give their orders early to secure a supply.

SOLELY PREPARED BY **CORRY, SOPER, FOWLER & CO. (Limited), LONDON.** TO BE OBTAINED OF ALL SEEDSMEN.

"ROSICA" Trade Mark Registered. Effective, Harmless. Promptly clears Roses and all plants from green fly, caterpillars, spiders, and other insect pests. It recommends itself to all such by its freedom of its efficiency, pleasant odour, the facility with which it is applied, and its cheapness in application; so that, in any case, however particular, can use it, and it always ready for use. PRICE 1s. Sold of all Chemists and Seedsmen, and of the manufacturers.

F. SCHUTZE & CO., 31A, Abchurch Street, London E.C. Apparatus for use of Rosica, 4s. 6d., 1s. 10d., and 1 lb. 4d.

Testimonials.
 "Shirburn Castle, January 5, 1890.
 "SIR,—As you requested my opinion of the houses which you erected for me some 4 years ago, I beg to inform you that I consider them a perfect success, and I have recommended them to many of my neighbours.—Yours truly (signed) MACLEOD STELL."
 "Hornby Castle, Lancaster, February, 1890.
 "Major FOSTER has much pleasure in stating that the conservatories and forcing houses which were erected by Mr. Helliwell in 1884, continue to give perfect satisfaction, both to himself and his garden."
 "Estate-Office, Ripley, Yorkshire, January 23, 1890.
 "Sir HENRY INGILBY has much pleasure in stating that the glazing work executed by you, under your patented system, at the Ripley Castle Gardens, has been in every respect entirely satisfactory. The work has stood its own wear and tear extremely well, and has hitherto cost nothing to keep in repair."

HELLIWELL, 9, Victoria Street, Westminster.

"NEW THE EASY" LAWN MOWER.

HAS AN OPEN STEEL ROLLER.

A man can work a 24-inch machine with-
 out assistance.

The Front Roller, with simple adjustment for regulating height of cut, enables the machine to cut close to the ground, and to do fine work, besides adapting it for verge-cutting.

There is no easier working, no better finished, no stronger, no more durable mower in the market.

To be obtained through all the leading Ironmongers and Saddlers, or from the Sole Licensees.

SANKEY'S GARDEN POTS

Are used by the leading Horticulturists and largest Nurseries in the World, and acknowledged by all to be the lightest, strongest, best coloured, most perfect shaped and finished pots ever manufactured.

MARKET POTS,
Or Long Toms, are largely used by Market Growers—they are made a greater depth, water at bottom, and save half an inch in width at top over all other pots. Have no ribs.

VINE POTS

Are used by the leading Vine growers throughout the Kingdom, and pronounced of unequalled value for Vine Culture.

CHRYSANTHEMUM POTS.

Considerably deeper than ordinary—very broad at bottom, almost flat top—slight slope about flow over when outside. The narrow bottom of pots give maximum amount of room for treatment of roots of plants.

CLEMATIS POTS.

OPINION. "Your pots are light and strong, first class colour, shape, and finish. Clematis Pots" gave wonderful results in the trial, and our customers are Messrs. Wood & Ingram, Huntingdon.

ROSE POTS.

OPINION. "We are glad to hear you are highly satisfied with your Garden Pots. We are well made, light, yet strong, and we make them to order for others we have ever sold." Messrs. Richard Smith & Co., Nurseries, Worcester

"The Flower Pots I have long since supplied us with are light, strong, and I was most glad to receive most highly satisfactory." Messrs. Licksons Ltd. Chester.

"For nearly thirty years I have been using your garden pots, and I can say they are the best and cheapest." Mr. William Bull, Chelmsford.

"We have always found your Pots highly satisfactory. Great improvements in a few years in them." Messrs. Pearson & Sons, Stowell Nurseries, Notts.

Samples and Prices free. Catalogue and list sent free on 1/6. Half carriage on K. S. Price lists enclosed.

"Frigi Domo"

REGISTERED TRADE MARK

CANVAS.

From Damp, Frost, and Cold Winds. A perfect Non-Conductor of heat, keeping wherever it is applied an even temperature.

To be obtained of all Nurserymen and Seedsmen.

NOTICE.

The words "Frigi Domo" are registered as a Trade Mark, and in two recent actions of Benjamin Edgington, Limited, Plaintiffs, v. John Edgington & Co., Defendants, and Benjamin Edgington, Limited, Plaintiffs, v. Osman & Co., Defendants, judgments have been obtained against the Defendants for a Perpetual Injunction, restraining them from using the words "Frigi Domo" as a Trade Mark for any material intended to be used for Horticultural or similar purposes not manufactured by or for the Plaintiffs or selected by them, and the Defendants. John Edgington & Co., and Osman & Co., were ordered to pay Damages and Costs.

IMPROVERS.—OPENINGS for several YOUTHS, with excellent future prospects.—J. C. NELSON, Cambridge Nurseries, East London, South Africa.

WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Rent Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DEPUTY LANE, to W. RICHARDS, or, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Gardeners, Farn-Bailiffs, Foresters, &c. DICKSONS, Royal Nurseries, Chester, (Limited), are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practised at all their businesses. All particulars on application. Telegraphic and Postal Address.—"DICKSONS, Chester."

IMPROVER, in the Houses, in good Establishment.—Age 18; strong, active, and willing. Three years' Nursery experience. Excellent character.—W. HILLS, The Gardens, Hantsbury, Stockbridge.

PLEASURE GROUND MAN, or Ind or out—Age 25; three years' good character. State wages to T. K., Embury, Hertford, Herts.

TO NURSERYMEN. A young Man (age 21) seeks a situation under a Foreman; three years' experience under Glass. Good references.—JAPONICA, Mr. Holmes, Bocklesdon, Herts.

TO GARDENERS, &c.—A CLERGYMAN wishes to recommend a Lad (aged 15) for situation in Garden. He is used to ordinary Outdoor Garden Work, and is very handy and obliging.—F. H. C., Denton Rectory, Graftonham.

TO GARDENERS.—Wanted, by a young Man with some knowledge of Gardening, a comfortable home, where he would have the opportunity of gaining practical experience. Will pay an adequate sum weekly for board.—*Read in Gardener's Chronicle* Office, 41, Wellington Street, Strand, W. C.

TO GARDENERS. A Lady wishes to recommend a strong active Youth (age 15) in Garden. Three years in present situation. Getting to look for place.—Miss BERRYMAN, Cobham House, Woking.

TO HEAD GARDENERS.—THOS. H. ST. JOHN, Queen's Street, Westfields, Bedford, wants a situation for his son (age 12) under a good Gardener. Two years' experience. Respectable and well educated. State terms. Address as above.

TO GARDENERS.—A CLERGYMAN wishes to find a place for a strong active Boy (age 15) next August, under a good Gardener, where he will have opportunities of Learning.—Rev. J. HERBERTS, Hinton Rectory, Aylesford, Kent.

SEEDSMEN or CORN MERCHANTS.—A young Man requires a situation in the above. Six years experience in Retail Seed Trade. Good references.—E. BIRCHTON, Ombayre, Dordrecht.

PAINTER, GLAZIER, &c., on Gentleman's Establishment.—Age 23; filled a similar situation before. Good references given.—W. D., Gas Works, Cobham, Surrey.

SHOPMAN (ASSISTANT).—Age 24; over eight years' experience.—MENTHA, *Gardener's Chronicle* Office, 41, Wellington Street, Strand, W. C.

SHOP ASSISTANT.—Four years' experience in London and Provincial Houses. Good references.—A. G., 13, Alfred Road Sparkbrook, Birmingham.

HOLLOWAYS' OINTMENT and PILLS.—H. COLLS, Cougle, Shortness of Breath. These medicines require early and unremitting attention, for if neglected they often end in Asthma, Bronchitis, or Consumption. The ointment will rub upon the chest and back, penetrating the skin, is absorbed and carried directly to the lungs, whence it expels all impurities. All the blood in the body is perpetually passing through the lungs, and there all noxious particles tending to disease can be quickly, thoroughly, and permanently neutralized, rendered harmless, or ejected from the system. Holloway's Ointment and Pills perfectly accomplish this purification; and through the blood thus cleansed, the influence of the wonderful medicinal searching the remotest parts of the human body, and thus cure all disease, action, whether internal or external.

PEARS' SOAP

HEALTHFUL
SKIN,
GOOD
COMPLEXION
AND

SOFT, WHITE
BEAUTIFUL
HANDS.

PEARS'
SOAP

PREVENTS
REDNESS,
ROUGHNESS &
CHAPPING.

PEAR'S SOAP.

THE PUREST & MOST DURABLE
TOILET SOAP,
HENCE THE BEST & CHEAPEST.

PEARS' SOAP for the Skin and Complexion, produces Fair White Hands—Soft Healthful Skin—Bright Clear Complexion. Its agreeable Perfume, beautiful appearance, and soothing properties commend it as the "GREATEST LUXURY OF THE TOILET." Prevents Redness, Roughness, and Chapping. Imparts and maintains a soft velvety condition of the skin. Recommended by SIR ERASMUS WILSON, late President of the College of Surgeons of England. **PEARS' SOAP** is pure, delightful, fragrant, durable; free from excess of alkali, contains no colouring matter, and may be used to the thinness of a wafer. **PEARS' SOAP** is sold everywhere in Tablets, 1s. each; larger sizes, 1s. 6d. and 2s. 6d. (the 2s. 6d. Tablet is perfumed with Otto of Roses); smaller Tablets, unperfumed, 6d. Insist on having **PEARS' SOAP**, as vilely injurious imitations are often substituted.

Editorial Communications should be addressed to "The Editor," Advertisements and Business Letters to "The Publisher," at the Office, 41, Wellington Street, Covent Garden, London, W.C. Printed by WILLIAM RICHARDS, at the Office of Messrs. BRADBURY, AGNEW, & CO. (Limited), Lombard Street, Precinct of Whitefriars, City of London, in the County of Middlesex, and published by the said WILLIAM RICHARDS, at the Office, 41, Wellington Street, Parish of St. Paul's, Covent Garden, in the said County.—SAT 12DAY, April 26, 1890. Agent for Manchester—JOHN HAYWOOD

THE PATENT "EXCELSIOR" LAWN MOWER.

The Highest Prize at Paris.

The First Prize Silver Medal, Paris Exhibition, 1889.

The Special Diploma of Merit, Glasgow Exhibition, 1888.

Two First Prizes, Liverpool (open to all the World) Trials, 1886.

The Highest Prize in England.

Why use the clumsy old-fashioned machines, and work yourself to death, when by using the moderna, scientifically constructed, labour-saving implements you can turn a tiresome task into a pleasant pastime? Fools work the hardest, wise folks use the patent

"EXCELSIOR."

Winner of more 1st Prizes and Premier Awards of recent date than ALL OTHER LAWN MOWERS combined.

Professional Gardeners prefer them because they save time and labour.

Amateurs prefer them because they make the lawn as level as a billiard table.

Ladies prefer them because they can mow the Tennis Court themselves with ease.

Children prefer them because they work so exceedingly easy.

MY NOVELTIES FOR 1890,

which are quite equal to my previous introductions, many of which are among the most popular of the day. Each section is fully represented, and every good variety will be found fully described. I have a grand collection of

CACTUS, SINGLE, POMPONE, SHOW, FANCY, and STELLATE VARIETIES.

All are good strong plants, established in pots, and will be ready for planting the 1st week in May. This Catalogue also contains a fine collection of the

NEW LARGE-FLOWERING CANNAS,

Having flowers almost as large as Gladioli, of almost every shade of colour. This Catalogue also contains an abridged List of Cactaceæ, Marantaceæ, Euphorbiaceæ, single Euphorbiæ, and many other popular groups for present planting.

I have issued this season the following Descriptive CATALOGUES:—Illustrated Hardy Perennials, Florist Flowers, Tree and Herbaceous Fossy, Japanese and Alpine Primulas, Climbing Plants, Hardy Ferns, Chrysanthemums, Choice Flower Seeds. Any of which can still be had upon application to

THOMAS S. WARE, HALE FARM NURSERIES, TOTTENHAM, LONDON.

THE COTTAGER'S CALENDAR of GARDEN OPERATIONS.

Price 3d., Post-free 3½d.

THE

Gardeners' Chronicle.

SATURDAY, MAY 3, 1890.

THE MICROSCOPIC STRUCTURE OF HYBRIDS.

AT the March meeting of the Edinburgh Botanical Society, I gave a microscopic demonstration of the structure of hybrid plants and of their parents; at the same time I made a few explanatory remarks, and I propose now to expand these into a short communication. I trust that this may prove interesting to those at least of your readers who look to hybridisation as to the great field of promise for experimental horticulturists.

During the last few years I have studied minutely the general and microscopic structure of pitched insectivorous plants. At an early stage in my investigations, I was struck by the perfect blendings in certain well known hybrids of the appearances presented by their parents, and this not merely in habit, consistence, shape, and colour, but even in such minute details as the relative number of stomata in a given area, the size and shape of cell hairs and of the cells from which these sprung, and the mode of deposition of thickening substance on their primary cell wall.

The fine series of hybrid Nepenthes, raised by the late Professor Dickson and Mr. Lindsay, or presented to the Royal Botanic Garden by the Messrs. Veitch, formed a rich field for study, but my attention was specially arrested on examination of a set of seventeen hybrid Sarracénias, kindly supplied to me some months since by Mr. Moore, of Glasnevin Garden. As one after another of these was passed under the microscope, I was gradually inclined to believe that a hybrid plant may exhibit blending of parent peculiarities in every cell. This was easily demonstrated in the case of epidermal tissues which are apparently the most plastic of all.

Unwilling to trust the evidence of such highly specialised plants, I examined other hybrids belonging to various orders, as Dianthus Lindsayii, Philageria Veitchii, Saxifraga Andrewsii and Churchillii, Hedychium Sallerianum, and also the supposed hybrid Bryanthus erectus: these not only verified my previous

conclusions, but enabled me to extend them in a convincing way. I now subjoin descriptive notes of the more striking parts which may be readily examined by any one conversant with microscopic work.

The first-named hybrid, *Dianthus Lindsayii*, is not only intermediate between Sweet William (*D. barbatus*) and the pretty alpine Pink (*D. alpinus*) in habit and leaf-form, but if we compare the leaf-epidermis of the three, we find that in the field of view of a low-power Zeiss objective (A), Sweet William shows about 900 stomata on its under epidermis, and 100 to 400 on its upper; the alpine Pink shows on its under epidermis 600 stomata, and on its upper 400; the hybrid shows 750 on its lower, and 290 on the upper epidermis. The epidermal cells also of the hybrid are intermediate between those of the parents.

Phlœgia Veitchii is a remarkable cross. With a decided leaning in naked-eye and microscopic appearance to the seed-parent, *Lagereria rosea*, it nevertheless shows in cells of the root, stem, leaf, and flower a strong infusion of *Phlœsia buxifolia* "blood." Thus the thickened cells in the bundle-sheath of fully matured roots of the hybrid are intermediate between the greatly thickened cells of *L. rosea* and the slightly thickened cells of *P. buxifolia*. In the stem, the epidermis, cortex tissue, bundles, and matrix-cells exhibit a similar blending; but as usual it is the leaf which presents the most pronounced union of characteristics. On surface view, the upper epidermis of *L. rosea* shows thin-walled, wavy cells, that of *Phlœsia buxifolia* thick and straight-walled cells; that of the hybrid shows thicker-walled cells than the former, and approaching the latter on being nearly straight; the lower epidermis in *L. rosea* consists of thin-walled, wavy cells, and amongst these are irregularly scattered stomata, whose guard-cells are fully exposed on the surface. In *P. buxifolia*, the epidermal cells are straight-walled, but have undulating free surfaces, and embedded deeply beneath these many stomata appear, arranged nearly in parallel rows. The hybrid, though showing a bias towards the female parent, is again intermediate. In the amount of pallidness and loose parenchyma, and the size of the chloroplasts, the same is true.

I have not as yet had opportunities of examining the flowers of many hybrids, but for specimens of that just discussed, I am indebted to my friend, Mr. Dunn, of Dalkeith Palace Gardens. While the echinated pollen grains of the parents appear plump and well filled with protoplasm, those of the hybrid are shrunk and starved looking, with the exception of one here and there, which seem as if they could effect fertilisation. The same apparently holds true so far as I have examined (this includes nine hybrids and their parents), but the more nearly two parent species approach each other in habit and structure the more abundant do the potential pollen grains appear to be.

Saxifraga Andrewsii is a hybrid which perfectly blends the peculiarities of the "Geum" and "Aizoon" sections of the genus. The upper epidermis of the leaf is devoid of ordinary stomata, as in *S. Geum* and its allies, and in this differs from *S. Aizoon* and the crusted Saxifrages, which all have an abundance distributed over patch-like areas. The marginal water stomata in size and colouring resemble the former, but the epidermal cells which surround them have little knob-like excrescences on which gathers the calcareous deposit which gives to the crusted Saxifrages their typical character. These are only found in the "Aizoon" group. But the mesophyll tissue and vascular supply in the leaf of the hybrid is also intermediate, for, to refer only to the last, *S. Geum* has the lowest water stomata on each side of the leaf margin partly supplied by two bundles which spring from the main leaf bundle near its junction with stem, partly by branches of two given off much further up; *S. Aizoon* has three to five on each side, wholly supplied from the lateral pair; in the hybrid two to three are thus supplied.

The hybrid *Hedychium*, in which the late Professor Dickson interested himself greatly, and which were duly described in this periodical, were next examined. I hoped that these would show in the starch granules of the rhizome cells blending of the parent conditions. I was greatly pleased to find my hopes amply realised. Selecting pieces of mature rhizome of *H. coronarium*, *H. Gardnerianum*, and the hybrid, I found that while the granules of the first were large, flat, oval plates, and those of the second small triangular shells, those of the hybrid were shaped as if half of *H. coronarium* granule had been fused with a reduced one of *H. Gardnerianum*. A study of the hybrid resulting from *H. coronarium* crossed by *H. elatum* gave like results.

While treating of cell contents, I may note that by the kindness of Mr. Buchanan, and of his gardener, Mr. Grossart, I have been able to examine the hybrid *Masdevallia Chelsoni* and one of its parents. The purplish-red sepals of the former owe their colour to large rich yellow granules or chloroplasts present in the epidermal cells, and to vesicular hair cells springing from the epidermis, which are filled with a purple pigment. In *M. Chelsoni* the yellow chloroplasts are mostly one-third to one-fourth the size of those found in the parent already examined. I fully expect, therefore, to find the chloroplasts in the seed parent as small as, or smaller than, those in *M. Chelsoni*, when I have an opportunity of looking into it.

For several reasons, I have given considerable attention to the Ericaceæ. The beautiful *Bryanthus erectus* is a bigeneric hybrid of pronounced type. Totally different as are many of the tissues of the parents, these are blended in the hybrid in a singularly interesting manner. The relative size of the pith and of the individual pith cells, the structure of the pith and of the outer bark, in stems of equal age, the leaf shape on transverse section, and the disposition of cells in it, also the structure of the floral parts in the hybrid, are all intermediate between the parents. *Erica Watsoni* (a wild cross between *E. ciliaris* and *E. tetralix*) is a very evenly balanced hybrid, but I will only refer in detail to its another structure. In *E. ciliaris* the anthers have no tails, in *E. tetralix* tails about one-twentieth of an inch long are produced from each anther lobe, in *E. Watsoni* the tails are exactly half as long as in the latter. In *E. tetralix* each cell of the anther wall is swollen out into a short conical mamilla; in *E. ciliaris* this mamilla is strongly developed, and is often constricted in the middle. *Erica Watsoni* has mamilla exactly intermediate in size and shape. I have carefully worked over *Erica Mackayii*, but will defer discussion of it for the present.

The numerous crosses of *Rhododendron* effected by Mr. Grieve, of Messrs. Dickson's nurseries; by Mr. Fraser, of Messrs. Methven's nurseries; and by Mr. Lindsay, have further verified the line of investigation. The cross between *R. ciliatum* and *R. Edgworthii* greatly resembles the former, but scarcely at all the latter, in naked-eye appearance; so much is this the case, that I doubted the accuracy of the supposed parentage when I received specimens of the three from Mr. Lindsay. An examination of the leaf alone sufficed to set my doubts at rest. In the number and mode of distribution of the stomata, the structure and cell contents of the scurf-scales, the distribution and shape of the hairs, and the leaf-structure when seen on transverse section, the minute features on both parents were strongly traceable in the hybrid. *R. præcox* and *R. glaucociliatum*, are equally deserving the attention of any who wish to follow out for themselves this line of inquiry.

A comparison of the stomatic distribution in many hybrids and their parents shows how constant and regular such minute tissue-modifications may be, specially if one observes previously whether the hybrid inclines more to the pollen or the seed parent.

Thus, under the field of view of No. 7. Zeiss objective, *Cypripedium insigne* shows 11 to 12 stomata, *C. villosum* shows 21 to 23, the hybrid 16 to 17, *C.*

barbatum has 3 to 4, *C. insigne* has 11 to 12, *C. Ashburtonæ* (which more nearly resembles the former) has 6 to 7. *Dianthus Lindsayi* has already been referred to, and I may further cite *Phlœgia Veitchii*, various Saxifrages, *Sempervivum*, *Ericas*, *Rhododendrons*, *Daphne*, &c.

Enough has been adduced to show that, as the result of union of the fertilising contents of the pollen-tube with the egg-cell of a plant, a new character is assumed by the egg-cell, and that as it grows and divides to form the embryo plant, every cell of that plant inherits the peculiarities of both parents at times in a perfectly balanced way, so far as our limited powers of study can carry us, at times with an evident leaning or bias to one parent. It is, therefore, evident that a wide field for observation and experimental research is open alike to the biologist and horticulturist. For the biologist, many problems bearing on heredity, on cell-history, on the relation of species to each other, on the production of hybrids [bud spots], and on the evolutionary origin of organisms, which have hitherto been greatly confined to the region of speculation, may thus be reduced to accurate scientific study. For the horticulturist, who has already opened the way so much, further incentives to the prosecution of hybridisation experiments present themselves.

About sixty hybrids and their parents have now been examined by me, and I hope in time to publish an account of these, and others which may reach me. May I be allowed to solicit from your wide circle of readers, specimens of such hybrids and their parents as can be spared. A bit of root, stem (rhizome, tuber, or other part, if such is developed), a leaf or two, and flower, will amply suffice, or any of these will prove helpful, specially leaf and flower. It is only by comparison by a wide series of plants that such investigations can be fruitful in good results to the horticulturist. I feel sure that many will be willing to aid me in the way indicated.

I may be allowed to express best thanks to the Directors and Curators of the Kew, Glasnevin, Trinity College, and Edinburgh Botanic Gardens, as well as to several private donors, who have generously supplied me with material. *Dr. J. Macfarlane, Botanical Laboratory, Royal Botanic Garden, Edinburgh.*

NEW OR NOTEWORTHY PLANTS.

ZYGOPETALUM CAULESCENS, Rolfe, n. sp.*

A VERY interesting and remarkable *Zygopetalum* was introduced some time ago by Messrs. F. Sander & Co., of St. Albans, I think from Brazil, but unfortunately I have mislaid the letter, which came with the original specimens. It has now passed into several collections, and specimens have been received for determination from the Rev. F. D. Horner and Mr. J. O'Brien, those from the latter having been sent by some correspondent of his. I can find nothing at all like it, and therefore propose for it the above name, in allusion to its remarkable caulescent habit. It belongs to the section *Euzygopetalum*. The material to hand is ample, consisting of two pseudobulbs, several leaves, two racemes, and several flowers, but from the appearance of the plants I saw at St. Albans, I should say they are much weakened by their long journey. How far it will prove of value as a garden plant can better be decided when the plants are fully established, but at present the

* *Zygopetalum caulescens*, n. sp.—Caulescent, stems from 3 to 2 feet high, clothed with the sheathing bases of the old leaves, rooting below. Leaves distichous, linear-lanceolate to linear, acute, 5 to 7 inches long, but probably longer when the plant is developed. Racemes erect, at present 6 to 8 inches long, two to three-flowered. Bracts lanceolate, acute, compound, 1½ to 2 inches long. Flowers 1½ to 2 inches across. Sepals and petals lanceolate-linear, acute, very pale green, blotched with maroon-purple. Lip cuneate-obovate, truncate or slightly emarginate, hairy, white, the radiating nerves with interrupted violet lines, from which arise stronger violet hairs; base with a pair of minute ancles; crest semicircular, fleshy, with several radiating keels and rows of violet hairs. Column elongate, hairy in front, with a pair of narrow wings on either side of the stigma.

FIG. 85.—CYPRIPEDIUM MORGANÆ X. (SEE P. 552)

flowers are smaller than those of *Z. Mackayi*, and the colours less brilliant. Notwithstanding the totally diverse habit, I should think our novelty is as much allied to this species as to any other. The species of this affinity are so puzzling, that it is a relief to find one which has some really distinctive characteristics. *R. A. Rolfe*.

MULCHING FRUIT TREES, ETC.

There is one matter of modern practice which gets insisted on in and out of season, by gardeners in print and in speech, and which runs the risk of getting overdone, and that is mulching as applied to the roots of trees in our orchards and kitchen gardens.

Mulching, as applied to trees newly planted, is right enough, and is a help to speedy rooting, equally applicable to the forest tree or garden shrub. Even in these cases the amount should be small, and not extend much beyond the root area, its sole object being the retention of moisture in the soil; for if the latter becomes evaporated by hot sun and parching wind, the interstices of the soil become filled with air, which draws the moisture, or in other words the sap, out of the roots in a harmful degree, and the exhaustion of moisture from the soil is only partially replaced in the warm season by capillary attraction from below, or by uncertain rains. B-tore mulching became so generally advised, we were taught to rely on a crumbly surface to retain moisture in the land, and for all subjects not recently planted, I prefer it to mulching, as being better adapted to our moist climate and weak sunshine. For if mulching has its benefits, it also has the one great drawback of hindering the action of the sun in aerating and warming the earth. We look to the sun as the one source of heat, wherewith plants are enabled to grow, and yet we do much by putting on masses of non-conducting material like wet straw and Fern, and even short grass, to hinder the access of sun-heat to the soil surrounding the roots of our trees. I well remember an instance of successful Peach, Apricot, and Fig growing in a garden 300 miles north of London, where the gardener—who, by the way, had never missed a crop in the thirty years he held the situation—never employed mulching to his wall trees after the first summer following replanting. The border was of moderate depth, of lightish loam resting on basalt rock, or the overlying strata of heavy loam inclining to clay. The soil of this south border was warmed to the depth of one and a half feet, because there was no non-conducting medium spread on its surface; growth on the trees was moderate, and it ripened satisfactorily, forming plenty of blossom buds. The surface was pricked up twice during the summer, and hoed as often as became necessary to keep down weeds; and walking on it was by no means forbidden—and this was quite judicious, for nothing tends to good rooting, short growth, and fruitfulness like a firmly trodden soil. In wet weather only were the gardeners directed to keep to the row of rough plants, which stretched from end to end of the border.

Mulching, unless it be very light indeed, has a tendency to prolong growth in the autumn, and hinder its commencement in the spring, and is wanted only in the lightest of soils, at least so far as established trees are concerned. Rosarians will tell us that exhibition blooms cannot be got without mulching, and the season of bloom would be unduly shortened without it, and yet good Roses can be obtained without its aid. The Rose grower finds it an easy way of feeding his plants, as by employing strong farm dung for the purpose he is able to do that, and needs not to go round to his pets with a pail of stinking manure-water from the piggeries or the stable, but instead thereof waters his mulching with clean water. That is entirely a matter of convenience, and does not touch the real point of the case. He is satisfied if his Rose blooms beat those of his rivals, and, moreover, the Rose puts forth its shoots at an early part of the season, and become

early matured even under this treatment; and the Rose grower does not look for a big crop, but only a few superlatively good flowers. Here, therefore, the man who mulches does but little harm, even from my point of view.

Where mulching is of the greatest use, and does scarcely any injury to the plants over which it is placed, unless a great thickness is made use of, is on plants on the rockery, in the flower-beds, Strawberry beds, edible, and sweet Peas in beds or rows, Hyacinths, Tulips, Dahlias, Hollyhocks, Rhododendrons, &c., which in the main exist by means of roots near the surface of the soil. To encourage the growth of these roots by means of mulching containing little or no manurial elements, or still better in the case of the vegetables named, with one that may consist chiefly of dung and straw, is quite reasonable and legitimate practice.

Cocoa-nut fibre refuse is now greatly in favour as a mulching material, and for covering the soil beneath plants with small sparse foliage, as bulbs which flower in spring, beds formed of plants in pots for immediate and temporary effects, or where it is desired to hide the soil before the plants cover the same. The use of this kind of fibre rests chiefly on the nice contrasts of colour obtained, and the greater degree of finish and neatness its employment imparts to beds of plants; and as it contains nothing that is edible it is not disturbed by birds in search of food, nor do earth-worms throw their cast up through it. It contains no plant-fodder whatever, and may therefore never find employment as a feeding mulch.

To plants which are not expected to carry extensive crops of fruits, one of the best mulches is half-decayed leaves, or rather leaves left to decay about plants with many surface-roots. These should lay not more than 1 inch in thickness, and may be kept in place by a little soil being sprinkled over them. In beds of shrubs, the wind will disturb the leaves at the outside, and these parts only will require to be kept in place in the manner above stated. It may seem odd to many to recommend pieces of stone, boulders, or pebbles as a mulching, and yet these things rank among the best retainers of moisture and also of warmth—points of great importance. Our ordinary mulches are not bad moisture-keepers, but they are the worst of heat-keepers; whereas dark-coloured boulders are about as good as could be found. Roofing tiles, and less so roofing slates, are excellent means of drawing roots to the surface, when laid down pretty close together over the soil. This was recognised by our forefathers in growing the Strawberry, for they lined the rows of plants with the common red tiles, and obtained clean fruits, and plenty of roots near the top. Of course, the tiles were only down in the summer-time. It is a capital plan for growing early crops of these fruits on steep sloping banks facing south.

Those who have had the management of gardens in some parts of Hampshire where flints abound, will readily recognise the usefulness of stones on the surface.

In the Alpine Garden, amongst the smaller gems, including *Primula*, *Androsace*, *Arnica*, *Aubrietia*, *Calandrinia*, *Celandine*, *Cistus*, *Cortusa*, *Cyclamen*, *Gentians*, *Lithospermum*, *Phyteuma*, *Saxifraga*, *Thymus*, and many others; stones placed over the roots in small numbers, and around the plants, or amongst which they may be placed, are amongst the great points of successful culture. The stones conserve moisture in the driest times, shelter the surface-roots, whilst at the same time they induce them to keep near the source of warmth, preserve the crown from dangerous wind-rocking, and form suitable spots for the germination of seed dropped by the plants, and for other natural modes of increase. And it must be said that most alpine seem much more at home when nestling amongst stones and rocks than when placed on the level surface of a border, and liable to injury from hoe and rake.

Most Ferns are benefited by growing amongst stones, if the soil employed be suitable, or by having stones placed around them; and as a rule the more stone and the less soil the better do the plants

grow. In cases where boulders or sandstone cannot readily be obtained, and the Ferns grow on the level land, it will be found good practice to employ a mulch of leaf-mould, which should be only partially decayed. In all that has been above stated, there is nothing whatever that can claim to be new; but it is obviously of benefit to bring out of the horticultural arsenal some of the old appliances, for fear they should become rusty and forgotten. *J. T. E.*

ORCHIDS IN SIKKIM.

When an error gets to be periodically repeated, without contradiction, it becomes a duty to try to set it right, and such an error is the recorded altitude at which *Cymbidium eburneum* is naturally found. This, as frequently quoted by *Gardeners' Chronicle* correspondents, on the authority of Griffiths, is 5-6000 feet, in the Khasia Hills, which I believe to be incorrect. The plant is not uncommon in the Sikkim Himalayas, but does not occur over 3000 feet. Its usual position is high up on the spreading limbs or forks of trees, by river beds, in the hot, steamy valleys, from 1000 to 3000 feet above sea level, and, judging from well-known localities of other plants common to Sikkim and Khasia, it ought to be found in the Khasia Hills, at rather lower elevations than it is in Sikkim. It would surprise me greatly to learn that it really thrives—or even lives for many years—under cultivation, in anything near the temperature of that of 5-6000 feet, at the latitude of the Khasia Hills, which would be that of a greenhouse in England with the frost barely kept out. Naturally, it is a plant for the warm and not for the cool Orchid-house. Many species of Orchids, as well as of other plants appear to have accommodating constitutions, and are found growing equally well at widely different altitudes, but *Cymbidium eburneum* is not one of them.

In the *Gardeners' Chronicle* of March 1, p. 266, it is stated that *Pleione* are found in the mountains of India "clinging to moist rocks, in positions exposed to full sunlight," as well as on the trunks of trees; and that "many growers fail with them, through giving them tropical treatment and excessive coddling." It seems to me that both of the above quotations, although correct in part, contain possible sources of error. Most people, I think, would picture a "moist rock" as one with more or less water trickling pretty constantly over it; but in such situations *Pleione* are never naturally found. The cool section of the Sikkim *Pleione* grow abundantly on moss-covered rocks, and on the trunks and branches of trees, but those rocks never have any water running over them, except in the shape of rain as it falls from the clouds, and for a great portion of the year they are anything but moist rocks. For six months on end—October till April—they may get but two or three wettings, whilst from the middle of June till the middle of September they are usually in an almost constant state of saturation. In Sikkim, *Pleione* certainly do not love "positions exposed to full sunlight," but rather court the chequered shade. It is also a mistake to lump *Pleione* all together in their treatment, as it is, too, for *Cymbidiums*; and therefore the suggestion, without any qualification, against giving *Pleione* tropical treatment, although right in the main, is partly misleading. I know of four species of *Pleione* in Sikkim, viz., *Hookerianna*, *humilis*, *Walliichiana*, and *maculata*. The mean altitudes at which they are respectively found, in their above order, are 9000, 8000, 7000, and 2500 feet. It naturally follows that *P. maculata* should get tropical treatment, and the three others cool. *Pleione* flower so luxuriantly in these hills, that I can hardly imagine them to be finer under cultivation; but this is a mere hazard on my part, as I cannot call to mind having ever seen one of the genus in flower under cultivation, and certainly have not done so for the last quarter of a century; but were they as fine under cultivation in Europe as they are here under natural conditions, I cannot help thinking they would be more often noticed in horticultural papers than they are.

I have mentioned that some species of Orchids appear to have accommodating constitutions, and to thrive equally well at widely different altitudes. *Dendrobium nobile* is one of them. But I am not sure that the climatic conditions vary so excessively as they at first sight appear to do, or as the mean temperatures of the extreme elevations, between which they are found, would indicate. In Sikkim, *Dendrobium nobile* is found from about 1000 up to over 5000 feet. Until lately I considered 4800 feet to be its upper limit, but last year I found a big, healthy plant growing at 5300 feet. It was, however, in a favoured position. It was on the top of a big rock, among Ferns and other dwarf-growing plants, under the friendly shelter of overhanging boughs of trees growing behind the rock, whilst the face of the rock was bare, and fully exposed to the rays of the noon-day sun. Consequently, during the cold nights, it got the full benefit of the radiated heat from the mass of rock; for in the winter season our days are almost always bright and sunny. Without those friendly conditions the plant, at this high elevation, could have barely, if at all, existed; with them it flourished. It is on these sun-heated and sheltered rocks that *Dendrobium nobile* must be looked for in the cool regions of 4000 feet and upwards, but in the low, stiding valleys it chooses the topmost boughs of tall trees, where it is fully exposed to all winds and weathers, thus, seemingly, countering the cooling breezes in the hot valleys, and creeping into the warm corners at the cold heights. *J. A. Gamble, Darjeeling, April 5, 1890.*

[Orchid growers will cordially thank our correspondent, and we trust that he, and others placed like him, will favour us with their observations on plants as they grow in nature. Ed.]

ORCHID NOTES AND GLEANINGS.

A COMPLEX HYBRID CYPRIPEDIUM.

A conspicuously complex hybrid has just flowered in Messrs. James Veitch & Sons' collection. It was raised between *Cypripedium Harrisianum* superbum and *C. × acanthum* superbum, though the accompanying note does not state which was the seed parent. Both these plants are themselves hybrids, and the last-named has also a hybrid parentage on the one side.

The case stands thus. — *Cypripedium villosum* was fertilised with the pollen of *C. barbatum*, thus producing *C. × Harrisianum*. This hybrid was now fertilised with the pollen of *C. insigne* Maulei, when *C. × acanthum* superbum was the result, or what may perhaps be called a secondary hybrid. Once more this was crossed (one way or the other) with one of the best varieties of *C. × Harrisianum*, the result being a hybrid of the third degree. Its parentage is thus made up in the following proportions, *C. barbatum*, 2; *C. villosum*, 1; *C. insigne*, 7. It is said to be quite inferior to either of its parents in point of beauty, though a hybrid has not always attained its full development at its first time of flowering. From a scientific point of view, the point of interest is, that there should be complete fertility even when both parents are themselves hybrids, though probably many other such cases could be cited amongst garden plants. Such cases may yet throw light on the supposed multiple origin of certain races of florists' flowers. *R. A. Rolfe.*

ORCHIDS AT CHEAM PARK.

The collection of F. C. Jacob, Esq., Cheam, Surrey, is famed for the excellence of its large-flowered forms of *Odontoglossum crispum*, and for some remarkable and handsome hybrid *Odontoglossums*, several of which we have had occasion to note recently. At present, in the cool-houses are numerous massive sprays of *O. crispum* of the large white or blush-tinted type. Of the latter, the variety named *roseum* is a superb flower, and that named *guttatum fastuosum*, in addition to the rich rose colouring of the back as well in the front surface

of the flower, is heavily spotted with rich chestnut-brown.

Of the hybrid *Odontoglossums*, *O. Jacobianum*, with its crimson markings on pale cream ground, stands first, although there are in bloom some fine examples of *O. Ruckvianum* and *O. Andersonianum*, one of the latter being in the way of, but an improvement on, the form named *O. a. lobatum*.

In the same house were in flower *Odontoglossum Cervantesii* roseum, some fine *O. luteo-purpureum*, and *O. Wilekeanum*; also *O. citrosimum*, suspended plants, one with three fine spikes, and another with a spike of twenty-four flowers; some excellent forms of *O. Pescatorei*, well-flowered *Oncidium concolor*, the fragrant *Cattleya citrina*, and other good plants. It is noteworthy that the gardener, Mr. W. May, had to entirely change his treatment of these cool-house Orchids to that he pursued with good results at Stanford Hill. The soil at Cheam is warmer and drier, and the plants did not thrive nearly so well under that treatment. Mr. May therefore kept the houses much closer, giving less ventilation, and the plants have now returned to their old form, and this hint may be useful to gardeners having Orchids in chalky or gravelly districts, and whose plants do not quite satisfy them. In a small warm house the lesser *Cypripediums* are doing well, one monstrous form of *C. bellatulum* being in bloom. The *Phalaenopsis* are thriving vigorously, and some *Aérides* and *Vandas* also occupy places in the house. The next in use to this is one in which are displayed all Orchids in flower which may conveniently be moved. These are arranged with Ferns, which always remain in the house, and consist of very nice species and varieties. Here were specimens in flower of the pretty and fragrant *Cattleya Schroderae*, the white-flowered *Angraecum Sanderianum*, some fine sprays of *Phalaenopsis grandiflora*, *P. amabilis* and *P. Sanderiana*; several *Cypripedium callosum* — one peculiar variety having blackish warts on the surface of the petals as well as on the edge; the noble *C. Schroderae* ×, with its large carmine-rose flowers; *Dendrobium Devonianum*, and a curious upright growing *D. Pierardii* and other species.

The *Cattleya*-houses contained fine specimens, among others *Lelia purpurata*, well-sheathed, one mass having nearly two hundred pseudobulbs. Here, again, *Cattleya Schroderae* and *C. Mendii* were in bloom; and a plant of *Platyclinis glumacea* which had borne sixty flower-stalks; a *Cymbidium Lowianum* was in bloom, and *Anguloa Ruckvianum* in bud. The house also accommodated a number of thriving *Miltonia vexillaria*, of which some were in flower; others being *Aérides Fieldingii*, *A. crispum*, *Cypripedium Duryi*, and other *Cypripediums*. In addition to Orchids, is a general collection of plants and fruits, and a large garden, containing specimens of variegated Hollies, and other shrubs and trees which time alone could produce.

ODONTOGLOSSUM HORMANII ×, Rolfe, f.

Among the numerous hybrid *Odontoglossums* that have been described is one between *O. Pescatorei* and *O. luteo-purpureum*, bearing the above name. Among those which have at different times passed through my hands, I was never able to detect one bearing this parentage until now, when Mr. J. Fraser has brought a flower for determination from Mr. Pollett's collection. It is from the plant mentioned at p. 526, as exhibited at the last meeting of the Royal Horticultural Society. "A variety of *Odontoglossum crispum*, shown as var. *alba*, was sent by H. M. Pollett, Esq., Farnside, Bickley (gr., Mr. Parkes); this differs from the type in the fact that the yellow ground-colour is replaced by white." It is a rare and charming little hybrid, the cinnamon spots on the nearly white ground and the yellow disc of the lip forming a bright and effective contrast. It agrees fairly well with the description, but if compared with the original specimen, might not be found quite identical, as these hybrids are known to vary. Of the parentage I see no reason to

doubt. The colour, shape, and crests of lip, and the more entire wings with the minute spots, are all markedly characteristic of *O. Pescatorei*, and considerably different from those of the other parent. In fact, it is thoroughly intermediate. Whether the variety seeptra or another form of *luteo-purpureum* is concerned in the parentage, it would, perhaps, be difficult to say. *R. A. Rolfe.*

ANGREECUM SESQUIPEDALE.

Whether it is the result of difference of cultivation, or of variation, I have noticed that those plants which flower late in the season generally have the best blooms. I am inclined to believe that there are varieties of the species, as not only are the flowers of the earlier flowering plants usually inferior, but there is a more or less marked difference in the foliage, the early plants generally having smaller and thinner leaves, and of a lighter green than the late ones. But although these differences may be observed, I am not certain that they might not be brought about by conditions of culture, for where the differences were the most marked — that is, in the late flowerers — the plants were grown cooler, with much light and more air than was the case with the early-flowered plants. Moreover, I have observed that where *Vandas* grow in an ill-balanced, stuffy atmosphere, somewhat similar results are brought about — at least, as regards the foliage, which either gets spotted, or has a lax, half-rotiated appearance, which of itself proves that the treatment afforded the plants is not the right one. Here we grow them at one end of the *Cattleya*-house, where there is a maximum of light and air, and their growth is very satisfactory. The leaves of great breadth, and of a hard, bony texture slightly glaucous, and dark green in colour. The plant stands 2 feet high, the leaves being almost down to the base of the stem; and it bore this season two racemes of three and four flowers respectively, and of an ivory-white, 8½ inches over, the spur being about 12 inches long. Sometimes it has developed three racemes, and a single flower on a fourth, but the lesser the number the larger the flowers.

A point which I should like to know is, has any one ever succeeded in developing the second series of flower-buds which form on the opposite side of the raceme, and which usually fall off as the first series expand? This, I thought, owing to their being very prominent before the others expanded, and these, with the exception of the one next the point, fall off. *F. R.*

CATTELYA CITRINA.

Let those who find it difficult to grow this Orchid read what is said of it in the *Journal des Ombilicistes*. In the last number of this publication M. Vasseur describes how he succeeded in flowering *Cattleya citrina* in his sitting-room. He obtained the plant in October, 1888, and kept it through the winter in a room without a fire, but where frost did not penetrate. In fine weather, when the outer temperature did not fall below 12° C. (54° F.), the windows were opened, and throughout the following summer the *Cattleya* remained in the room, of which the windows were open day and night, shading being afforded, when necessary, by a curtain. At the end of October, 1889, the plant was transferred to the dining-room, where it remained all the winter, subjected to considerable fluctuations in temperature, and exposed to but little light; nevertheless, the plant produced four shoots, one of which flowered in March, and another will shortly do so, whilst new roots are being produced. The plant has been irrigated daily, and is growing on a block placed near the window, and near to two porous vessels of water, the evaporation from which supplies the necessary atmospheric moisture. In the same room is a zinc trough (*baquet*) filled with water, in which are placed some bricks, which support other Orchids, *Ferns*, and *Palms*. The late Mr. Skinner, it may be remembered, succeeded in flowering *Lycaste Skinneri* in his drawing-room.

THE VEGETABLE CONFERENCE.

The papers read at the Vegetable Conference, and published in a recent issue of the *Journal of the Royal Horticultural Society*, are well worth the attention of every one interested in growing good vegetables, and it would be desirable that a conference should be held every year, in order that the various effects of the different seasons might be thoroughly studied, new varieties of vegetables compared with standard kinds, and the results of experiments with manures, &c., demonstrated. At meetings such as this, information may be obtained which will do much to advance the various branches of horticulture.

Sir T. Lawrence did well in calling attention to the preserving of vegetables, and it would be desirable at another conference if this part of the subject could have more attention, and systems be introduced whereby some of our choicest summer vegetables could be preserved for winter use.

Mr. Veitch touched the right chord in his opening address by welcoming the gardeners to the Conference. Let us hope the words so fitly spoken will induce many who read them to rally round the Society, now that it is giving such practical proofs of its usefulness in the series of conferences that have been held of late years. He was emphatically right in saying it was a gardeners' exhibition, yet its value to the community generally was far greater than one of showy flowers. We cannot live on the latter, no matter how much they may please the eye; on the other hand, the whole of our food is derived either directly or indirectly from vegetables and plants that are mostly not celebrated for their flowers.

The improvement in the Pea during the period mentioned has been great as regards size of pods and the number of Peas contained; some worthless varieties have also disappeared; but as regards flavour the progress is *nil*. *Ne plus Ultra* is still the best-flavoured Pea we have, and one of the best croppers.

Among new Cabbages, Mein's No. 1 should have been mentioned. When obtained true, this is one of the very best, coming into use very quickly, and keeping in good condition much longer than some.

The new varieties of Broccoli are of better colour, the late ones showing a great improvement in that respect over Cattell's Eclipse, which was at one time the best late variety. I quite agree with Mr. Veitch that Brussels Sprouts are much improved, but these remarks do not apply to varieties of the giant type, which find great favour with some. This vegetable has always a strong taste; we want more of the Cauliflower flavour without much increase in size.

A variety of dwarf French Bean, called Paris Red, is the finest for length of pod, and for remaining a long time in good condition. It was introduced some years ago by Mr. Banyard, but is very little known. If a variety of the French Bean could be found that would lengthen the season outdoors by increased hardness, it would be a valuable acquisition, especially in northern parts of the kingdom.

In connection with Early Milan Turnip, it should be noted that its introduction has given us a Turnip that will bear a moderate amount of forcing better than the older varieties.

Among Onions the new varieties which grow to such enormous proportions are practically of very little use; moderate-sized roots are preferable for their keeping qualities. There is still room for a variety that will prolong the season after James' Long Keeping is over.

The Cucumber has, on the whole, made the least advance. Why it has been so unfortunate is hard to determine; for although it is perhaps more of a luxury than most things mentioned, here it is very much in request during the summer months, and the consumption of it increases. There is plenty of room for improvement in the miserable specimens of outdoor growth which are to be seen in towns during August and September.

Mr. Veitch's remarks on multiplying varieties by giving new names to old sorts are not by any means too severe. This practice is very much in the way of a steady advance in vegetable culture. Few things are more disappointing to an intelligent cultivator than to find he has been deceived after several months of painstaking interest, and has only got an old acquaintance under a new name, or possibly something new, but not so good or useful as what had been depended on before. The Royal Horticultural Society does good service in the trials it institutes at Chiswick of Peas, Tomatos, &c., and

circumstances; but why a space of 9 feet was wanted between the beds, I fail to see. I cannot agree with him, either, when he says there are no peculiar varieties of Asparagus. I have found the Early Purple Argenteuil comes into use before the other, when grown side by side; of course I admit all are the same from a botanist's point of view. Again, seed saved from extra strong plants must have an inevitable tendency to produce a giant race, as is the case also with all other vegetables, and most cultivators know the importance of making a good selection of plants for seed-bearing. A "giant"

FIG. 86.—CYPRIDIUM STONEI, VAR. PLATYLLIUM: THE PREMIER CYPRIDIUM. (SEE P. 552.)

also in examining and granting Certificates to really good introductions. If all growers could agree not to notice so-called "new" varieties, unless duly certificated, the sending out of worthless things would soon cease. We want a catalogue of vegetables, with a list of their varieties and synonyms—after the style of the National Chrysanthemum Catalogue—got up by some reliable and independent authority such as the Royal Horticultural Society.

Mr. Shirley Hibberd's paper is well worthy of perusal by every one interested in growing Asparagus, and the specimens he exhibited at the Conference showed what can be accomplished by intelligence and perseverance, even under the most adverse

race is obtained by this means, after a few generations from selected seed. Mr. Hibberd appears to use as much manure as anyone in his system of cultivation, and liquid manure in addition, although he characterises the ordinary system of manuring as "extravagant waste." Briedy, his system may be summed up in good drainage, a moist bottom, raised beds, limestone in abundance, plenty of space, and careful attention in developing the growth of the plant to the fullest extent by manuring, &c. M. de Vilmoir said the French growers used "abundance of manure," and plant 4 feet apart in the rows, and 3 feet between the rows. The use of raised beds for Asparagus is fast dying out in this country; they

can only be recommended on cold heavy soils, and in wet localities, neither of which should be selected for Asparagus culture.

Few persons could speak with such authority on "Winter Salads" as Mr. Norman, as few have to meet such a large demand as he does. His paper might well have been extended a little, so as to include a few more subjects sometimes used in salads, such as Mustard and Cress, Cucumbers, &c., which are by no means easily grown during the dark days of winter. Endive is often more conveniently blanched if taken up and placed in a warm and dark chamber, like Chicory.

The paper by Mr. J. Wright, on "The Food of Plants," should be well studied by every young gardener who aspires to eminence in his profession. There is ample room for experiment on this subject; we want a series of observations with the various manures and vegetables carried on for a number of years, in a similar manner to what Sir J. Lawes has

podis must be supplied, as they are puffed out to an abnormal extent; and again, the quantity of seed produced by these large-podded varieties is far less than such kinds as *Ne plus Ultra*, *Standard*, *Marvel*, &c.; a larger piece of ground has, therefore, to be planted, which means an excess of labour, and other expenses, and all that is gained—viz., the increased size of the pods—eventually finds its way to the swill-tub for the pigs. What is especially wanted among Peas is a dwarf *Ne plus Ultra* that will stand an ordinary winter, and come in for use in spring, at the same time as our small early varieties do now. On p. 33, "to the former a few days gained," should read, "to the latter."

In the paper entitled "Potato Improvements during the Last Twenty-five Years," by Mr. A. Dean, the once famous Scotch Champion deserved a slight recognition for past services. Although the celebrated *Magnum Bonum* has now almost driven it from the field, it is still much appreciated by some

instance, if not from seed, is by no means clear. A distinction should have been made between early and late Broccoli. May is too late for sowing the early kinds, and if sown in June they would be worthless. Very few persons would allow Cauliflowers to "come to perfection" in the seed-beds, neither is it necessary, if a good selection of varieties is grown, and a little care and judgment used in transplanting. If any difficulty is experienced in exceptional cases, sowing thinly in rows, and thinning them after, would be preferable to leaving them in seed-beds. In very light soils Spinach in summer is almost an impossibility, but the leaves of Spinach Beet answer the same purpose without giving half the trouble.

As mentioned in the introduction, a vegetable conference early in the season would be desirable at a future time, in order to complete or advance the work thus so well begun by the Royal Horticultural Society; vegetables being in many instances of such a successional nature, it is impossible to get the representatives of a year's supply all present at one time. *W. H. Dibbs, Ketton Hall, Stafford.*

NEW NARCISSUS.

BEFORE the periodical attack of Daffodil fever is quite expended, we may lay before our readers an illustration of one of the novelties exhibited by Messrs. J. Veitch & Sons, of Chelsea (fig. 87). The perianth segments are lemon-yellow; the corona of a deeper hue, cylindrical, but contracted at the throat. The margin of the tube is divided into shallow rounded lobes. It is the contraction at the end of the corona, as a lady's-sleeve is gathered in at the wrist, which has suggested the name of *Prodigy* for this variety which, as shown at the Daffodil Conference, was both novel and pretty.

NANT-Y-GLYN, COLWYN BAY.

MR. ALFRED O. WALKER's garden at Colwyn Bay is well known to readers of the *Gardeners' Chronicle*, from the occasional notes which its owner communicates from time to time, generally referring to rare and half-hardy plants, which are grown at Nant-y-Glyn. It appears strange to many gardeners, in similar latitudes, that such plants flourish there, just as they flourish in the favoured gardens of Plymouth, Laumorian, and other Devoe and Cornwall localities; but the matter is readily understood when the garden is seen. At the same time it must not be overlooked, that Mr. Walker is a very able and accomplished botanist, and that he, for many years, managed the large garden at the Chester Lead Works under much less favourable condition. He is now steadily showing us that many plants can be grown in our Northern gardens if proper means are adopted for their culture and protection, and we must not lay too much stress on his especially favourable environments.

The shores of Colwyn Bay are of clays and sands of glacial origin, resting upon the Wenlock shales of the Silurian group, the carboniferous limestones having been denuded. The rains of ages have worn deep narrow ravines through the boulder clays down to the sea, widening out inland when the hard shales are reached. In one of these deep sheltered valleys, Mr. Walker's house is built on the higher slopes, backed by Pin woods. The garden slopes down to a little brook, which runs through the grounds, and works a hydraulic ram, which furnishes an abundant supply of water for the house and garden. The whole is surrounded by fine trees, and is thus completely sheltered from cutting winds, whilst, at the same time, it enjoys abundant sunshine. These are most favourable conditions, and the genial climate of Colwyn Bay adds to the advantages which produce such excellent results. It does not follow, therefore, that plants which grow in Mr. Walker's garden will succeed elsewhere. It rather shows the extreme limits under most favourable conditions. Mr. Walker has at Nant-y-Glyn a most interesting collection of

FIG. 87.—NEW NARCISSUS PRODIGY.

so carefully done at Rothamsted with farm crops. Books of reference on chemistry suitable for a gardener are also scarce; one is especially wanted that would give analyses of the various vegetables in general use. By a judicious use of manures it is often possible to get more than double the ordinary produce from a piece of land. Exposure of the soil to the action of a winter's frost will sometimes do as much good as manuring, from the disintegration of the component parts.

Mr. T. Laxton is a great authority on raising new Peas, and one regrets to hear he finds it an "unprofitable occupation." His classification is somewhat curious. Surely "farinaceous" Peas, as in Class 2, are in very small request, and those of Class 3 would answer the purpose quite as well. If, as Mr. Laxton says, the increased size of the pods is a benefit to the market grower, it is by no means a boon to a private gardener who has a family to keep supplied. He has to supply enough Peas for each person at dinner to have sufficient; the pods count for nothing. In order to do this with such varieties as *Evolution*, *Duke of Albany*, &c., almost double the measure of

as one of the best Potatoes for flavour. What caused it to lose its disease-resisting properties so quickly is a mystery. Potato raisers would confer a great boon on the nation generally if they would give us an early Ashleaf suitable for strong loamy soils; the present race will only thrive satisfactorily in old gardens, and other light soils.

"Maintaining a Supply of Vegetables," the subject allotted to Mr. Smith, of Mentmore, is far too extensive to allow of full justice being done to it on such an occasion as this, although Mr. Smith has got a good deal of information into a small space. As regards varieties, he says it is beyond the scope of his paper to recommend them, but in many instances one or two particular varieties—say of Broccoli, Peas, &c.—make all the difference between success and failure as regards "maintaining a supply." In sowing Peas, "the end of November" is too late for many places; if not got in by the middle of the month, there is often very little chance of doing it afterwards. On p. 49 we are told, "French Beans transplant well, and come much earlier than from seed;" but how they are obtained in the first

plants, trees, and shrubs—such as are not to be found north of Devonshire in any other garden with which I am acquainted. The garden was formed about twenty years ago, so that the trees have attained to a considerable size. Of Eucalyptus there are five varieties, from 20 to 30 feet high, and all in perfect condition; the reddish branches contrasting strongly with the grey-green foliage. These have withstood five or six severe winters. *Pittosporum tenuifolium* has grown to 20 feet high, and is a remarkable tree with waxy leaves and dark purple flowers, which give out a strong honey-like perfume at nightfall. The narrow Laurel-like leaves with waxy margins give a play of light to the tree which adds greatly to its picturesque effect; it is a New Zealand tree, and was grown from seed by Mr. Walker, the native name for it is the *Matapo*. *Pittosporum eugenioides* bears a greenish-yellow flower, and the same waxy leaf, which is said to be lemon-scented. This we found to be the case with the young leaves. *P. tobira* is an Asiatic variety (the other two being from New Zealand). It has yellowish-white flowers, and bloomed throughout the winter, being now covered with seeds. *Benthamia fragifera* is 10 feet high, and in vigorous growth, but has not yet shown any signs of bearing the Strawberry-like fruit for which it is named. The *Arbutus* was, however, completely covered with its Strawberry fruit already, and was everywhere quite at home in Mr. Walker's garden. Of *Fremontia californica* there was a grand specimen on the lawn, 10 feet high. I saw it in bloom last autumn, when it was covered with its large golden yellow flowers, one of the most beautiful plants I ever beheld; now it is covered with Nut-like fruit, bearing ripe seeds. Another gem was *Grevillea rosmarinifolia*, a Tasmanian plant, which was in full bloom, and presented a remarkable appearance. The leaf is exactly like Rosemary, a beautiful greyish-green, and the flowers are in clusters of brightest red, with a coral-like lustre. A most curious contrast was *Colletia borrida*, a very strong grower, with large whin-like spines for leaves, and minute white flowers. *Eugenia apiculata* was 15 feet high; it bears Myrtle-like flowers, and ripens fruit. *Skimnia japonica* was also both in flower and fruit, and very beautiful. Mr. Walker takes especial interest in this plant, which has a curious history. The old *S. japonica* of gardens (= *S. Fortunei*, Mast.) was not the true plant, and does not occur in Japan. It has hermaphrodite flowers, and bears a small oval berry. The true *S. japonica* is dioecious, and was known, while ago, in gardens under two names, *S. oblata* and *S. fragrans*. It is now known that these two are the same plant. *S. oblata* is the true *S. japonica* of Thunberg and the female plant, whilst *S. fragrans* is the male.* The appearance of these two *Skimnias*, large bushes, planted side by side was a surprise to me, as I have only the old form at Brockhurst, a very inferior variety both in leaf and fruit. Mr. Walker's variety has much larger fruit of a better colour, and the foliage is also more effective. As a decorative plant throughout the winter it certainly holds a very high place, and should not be omitted in any good garden—care being taken to obtain the true forms, male and female. *Berberis nepalensis* was also a noteworthy shrub; it carries long racemes of yellow flowers, and has fine foliage. *Veponia Halkana*, which one usually sees in a greenhouse, was here in bud in the open garden. It has long panicles of lavender coloured flowers, and will shortly be a mass of bloom. There were many interesting climbing plants on the house and walls. A climbing *Hydrangea* from Japan, *Schizophragma hydrangeoides* was covered with white flowers. *Choisyana* covered a large extent of wall, and will soon be beautifully in flower. *Akebia quinata*, a most interesting plant to the botanist, was covered with fragrant purple flowers in clusters—male and female—on the same stalk. A very effective dark foliated climber was *Ampelopsis sempervirens*. For board effects there was nothing to beat that produced by a long row of *Berberis Darwinii*, which lined the carriage drive on

the approach to the house. Of course there were hosts of Conifers, *Cupressus macrocarpa* and *Pinus insignis* being the most vigorous. There were also a good collection of the Himalayan *Rhododendrons* nearly in flower, and a fine lot of alpine plants. Down by the brook were large masses of Bamboos, and a grand plant of *Chamaerops excelsa*, twenty years old; a good fernery with fine specimen *Todeas* and filmy Ferns; and lastly, an excellent collection of herbaceous plants.

The enumeration might be greatly extended, but the above will show the character of the garden at Nant-y-Glyn. With Mr. Walker for a guide through this interesting collection, one cannot fail to learn much, and to unlearn a good deal more. *Wm. Brockhurst, Brockhurst, Didsbury, April 17, 1890.*

GARDEN ARBOURS.

It may be said that we do not require much defence from the too ardent rays of the sun, but generally there are some few weeks in our apology for a summer when retreats, leafy or otherwise, form grateful adjuncts to a garden. I will mention a few names of plants adapted for covering such arbours:—*Aristolochia siphon*, Hops, Virginian Creeper, Clematis of most climbing species of their varieties; *Caprifolium perilymenum*, the Woodbine and its varieties, vulgaris, serotinum, and quercifolium; the Chinese *Lonicera flexuosa* and *L. f. variegata*; the Fly Honeysuckles are also rapid growers, and not much attacked by aphid—always a drawback to arbour plants; the hardy Grape-vines are good examples of this kind of climbing plants. The Rose affords a number of suitable subjects for planting, and selecting those which flower in summer, when an arbour is most used, we have the almost evergreen Bankian Roses, the amazingly floriferous Polyantha, the rapid-growing Ayshire Roses, like Roga, Dundee Rambler, splendens, and Boursault. Evergreen Roses of tolerable rampant habit are—*Felicite Perpetuelle*, Myrianthes, Kenonculi, Raupant, and Flora; the H.P.'s Bessie Johnson and Jules Margottin, both climbers. To these may be added Hybrid China Roses, Blairi No. 2, Brennus, Chacolle, and Paul Verdier. Most of the above are deficient in fragrance, and the following Teas are worthy of being planted; *Jaune Desprez*, Devonensis the climbing variety, Niphetos, Waltham Climber, Safrano, Gloire de Dijon; and, in very warm spots, La Marek, and Mauchal Niel. Of Noisettes, mention may be made of Aimée Vibert, Bouquet d'Or, Celine Forestier and W. Allen Richardson.

It will be apparent to most persons that the proper place for a retreat is in a sunny part of the garden, the air there being soft, warm, and buoyant, and devoid of any objectionable damps. In such positions, if the preparations are to soil for the plants, good drainage and freedom from shade of dense trees, which always, by the way, are provocative of draughts, have been attended to, the climbing plants will do well. A narrow border round the sides of the arbour might be planted with Carnations, and Musk, *Martynia fragrans*; sweet herbs, like Thyme, Lavender, Rosemary, *Aloysia citriodora* should find a place, and many other old fashioned plants about which tender memories cling.

What kind of floor should an arbour have? A most important question not always answered in the best manner. One may divide roughly these buildings into the architectural and the rustic. The former agreeing with the canons of harmony if placed near the dwelling-house, or the glasshouses, if any such be in the flower or pleasure garden; the latter being more in unison with the more natural features of a place. In the former case a floor, raised an inch or two, may be made of shells or pebbles imbedded in cement, parquet blocks, tiles in pattern, or small red bricks on edge. Stone, cement, slate, and asphalt are cold to the feet, apt to become green in the case of some, and scored by innumerable marks of shoe-soles. A veritable horror is a floor consisting of the bottoms of

inverted glass, or ginger beer bottles. In a rustic arbour, fine gravel, Derbyshire spar, or even clean yellow or white sand seem the most fitting materials.

PLANTS AND THEIR CULTURE.

THE CONSERVATORY.—The different species of plants in bloom at this date will make this house very gay. Cyclamens will soon be getting past their best, and should get placed in cold frames or on shelves, and water gradually withheld from them till the leaves decay. They do best in a frame facing south, so as to have sunlight to ripen their coriis. Young plants should get close attention, and be kept close to the glass in a temperature of 60°, keeping them clean and growing freely. Late sown seedlings of Cyclamen should now be in small 60s, and still earlier plants should be shifted if necessary. These plants ought never to be checked in growth, and should be kept clean and free from aphid. Late Tulips, Narcissus, Spiræas, Prunus, Guelder Rose, and similar plants, should be placed on the north side of a wall to retard them. Spiræas may still be divided and planted on an open border of rich soil, and kept well watered, liquid manure being afforded occasionally. If planted with a basin round each plant, the moisture is well retained about them, which otherwise would not be the case on a slope. If well treated they force readily, but a year's rest from forcing is beneficial. Deutzias need more care, cutting them back hard and affording them a little warmth to assist them to break. Repeat any that require it, and syringe them in bright weather to keep down red-spider. Deutzias will do in a cold frame in a few weeks time, and may finally be plunged in an open border facing south. Late Cinerarias should be cleaned from all aphid before removal to the conservatory. I should advise those who have not yet grown the new *Deutzia Watererii* to do so, it is useful for conservatory work and for cutting; it also forces freely, and its flowers are more than double the size of those of *D. gracilis*. *Dielytra spectabilis* should get planted out in a good border. *Cytisus* needs plenty of moisture, and occasionally some kind of artificial manure, as the pots soon get full of roots.

Perennetys just at this season are making growth, and do not need any heat. We find them as effective as Solanums, and much cleaner. Early plants of *Richardia* will past their best and not in need of shifting, when hardened off, may be plunged in their pots in a warm border. We grow a few for early bloom in this way; but the majority of the plants are turned out and divided, and planted in a border with plenty of decayed manure, and watered freely in dry weather, potting them up to about the middle of September. This plant when so treated produces the best swathes.

Intermediate and East Lothian Stocks are now useful, and require plenty of moisture at the root. A few should be kept back so as to form a succession by placing them in the open. Close attention should be paid to the growth of all seedlings required for summer decoration of the conservatory, and all crowding in the seed-pans avoided. *Celosias*, *Cockscombs*, *Balsams*, *Impatiens*, *Sultanias*, *Schizanthus*, *Nicotiana glauca*, *Rhodanthus*, *Browallia elata*, and *B. e. alba*, may be sown in small quantities; they will now come up quickly in an intermediate-house, and form a succession to the sowings.

Some of the early sown *Asters* may be potted up and grown in a cold frame. *Aguliegias* are also of use when sown in the autumn, and cultivated like the *Campanulas*. Both the foregoing may be put into 5 inch pots. *Primulus obconica* will now be useful if they were carefully divided and potted some time ago. Shift any young plants of *Fraxinea ramosa*, and grow them on in a cold frame. Divide old plants of the same, and give them extra warmth for a time. *G. Wythes, Syon House, Brentford.*

THE ORCHID HOUSES.

If the Intermediate-house *Berberis* will be breaking away, and must be well supplied with water. If there are several of these plants in the collection, it is a good plan to hang them up all together where they may receive a thorough drenching from the syringe two or three times a day. *Lælia harpophylla*, if requiring it should now be repotted, employing a compost of peat, sphagnum moss, and pieces of

* See paper and illustrations by Dr Masters, *Gardeners' Chronicle*, April 27, 1889, on the *Skimnia*.

potsher broken small. Vanda Kimballiana and V. Amessiana may be repotted. I find these plants do very much better in this house than when they are grown in greater heat. Angulosa Clowesii and its varieties now sending up their flower-spikes should not be allowed to suffer from want of water, and any plants which have not been repotted this year, the roots of which are filling the pots, may safely be given guano-water in small quantities, as previously advised for other things. A sharp look-out must be kept for the yellow aphid, which is a troublesome pest on the young growth of Angulosa. The plants are very liable also to the attacks of scale insects. The bottom ventilators may be kept open night and day, the night temperature being 60°, and that of the day 10° to 15° higher with sunheat.

East Lillian-house.—Epidendrum bicornatum now in flower does not like much compost about the roots, and does better when allowed to ramble over the potsherds and charcoal to which they cling. A copious supply of water the whole year around is another essential point, and during warm weather the plant may be syringed overhead twice a day, and if this be neglected or the leaves of the plant not often sponged, it is liable to thrips and red-spider. The plant is best when grown in baskets, hung well up to the glass.

Thauius tuberosus now going over may be repotted or rebasketed, as the case may be, a compost consisting of one part turf, fibre, two parts peat, and one of sphagnum moss being employed.

Catleya superba now breaking into growth must not be allowed to be dry at the root, as readily happens when it is placed on Tree Fern or wood rafts, with little material about the roots. It is best to dip the plants in water morning and afternoon. Calceyca tomentosa now in flower is a pretty and useful companion to the better known C. Massachusettsiana. Attend to previous directions, and let 70° be the minimum night temperature, and give as much heat as possible during the day with sun-heat, having due regard to shading. *A. G. Carr, Parkfield, Malvern.*

THE FLOWER GARDEN.

THE HERBACIOUS BORDER.—Weeds of all kinds must be sedulously hoed up, and cleared off these borders, using a Dutch hoe, that may easily be worked around the plants. Having made the borders clean, annuals may be sown in small clumps wherever desirable, leaving spaces for half-hardy plants, as Asters, Phloxes, Ten-week and other varieties of Stocks, which in the course of this month may be safely planted out.

Alpine Auriculas in beds are at the present time a pretty sight, with their varied hues. Much improvement has been made in these plants, and colours come true from seed, so that great variety may be obtained from one packet alone. Seed sown now in the open border, covered lightly with soil, or in pans in a frame, will produce plants to flower next season. Old plants after flowering may be divided in the same manner as Polyanthus, and planted in the reserve garden, in a shady part if possible, always putting them a little deeper than they were before. With the Narcissus positions and p. flore-pleno the best season is drawing to a close; most varieties are the better for being taken up every second or third year, and transplanted singly in fresh soil, the flowers deteriorating in size and numbers if left in one spot for a longer period. Stout labels should be put to these and other groups of bulbous plants, so that the name and position of them may be known.

Dahlias.—Where the tubers have not been started in heat, the dry roots of Dahlias may be divided, or planted whole in beds by themselves, or in herbaceous borders and shrubberies, having previously enriched the ground with some well-decayed manure, covering the roots from 4 to 6 inches with soil. When the shoots appear, thin them to three, leaving only the strongest. It is advisable to put in the stakes at the time of planting, so that the roots may not be damaged, as they may otherwise be if the former are put in after growth has commenced.

Tuberous-rooted Begonias.—Dry roots of these plants may be planted in specially prepared ground, a light soil and a warm situation being preferred.

Annuals.—Beds sown with annuals should be limed, as during the present mild showery weather slugs are likely to destroy the young plants. Use

dry, air-slaked lime, first put through a fine sieve, and either placed in a bag and shaken over the beds, or scattered finely with the hand.

Miscellaneous.—Proceed with the planting of Calceolarias in the open beds, and of all hardy plants used for edgings and carpet bedding, forwarding the work of preparing the beds as much as possible to receive the Pelargoniums, &c., which cannot be safely commenced till the end of the third week in May.

Harden off all the varieties of bedding plants as fast as possible now, taking care to cover up the less hardy kinds, should there be any appearance of frost. Subtropical plants that are becoming pot-bound should receive a shift, so that no check may be occasioned to their growth. *D. C. Powell.*

THE HARDY FRUIT GARDEN.

STRAWBERRY BEDS.—The plants are growing apace, and throwing up crowns of more than average vigour. If not already done, the quarters should have a covering applied to keep the fruit clean. The materials used are various, fresh stable manure, which if put on early answers well, becomes clean by the time the fruit is ripe, and it has some value as a manure. Short grass from the lawn, and cocoa-nut fibre are used, but I find in wet weather, and even on dewy mornings, these stick to the fruit. I use clean wheat-straw on the top of the winter mulching; this answers better than anything else that I have tried. It should be remembered that the longer covering beds is delayed, the more labour will be incurred in doing it. I give all fruiting plants before they come into bloom a good sprinkling of soot, then thoroughly soak the soil with the water hose, but then the garden is on a dry sandy hill; watering might be dispensed with in wetter soil. Nets should now be put into proper order for use.

Orchards. Trees which were late planted should have the stakes put to them now that the soil has consolidated, and mulchings may be put to all recently planted. Where mulchings are liable to be blown about, it is a good plan to lay a few sticks on the surface, and peg them down. All suckers must be removed from the base of the trees as soon as they appear, more especially in the case of Plums. Go over all trees where any trace of American blight is visible, and dress over and gum up all crevices. Insects, after the late cold and biting winds, will spring into life as soon as foliage is developed for them to feed upon. It is now getting late for dressing trees, but so long as the flowers are undeveloped, they may be dressed with simple remedies. Black and green-fly in many gardens give a great deal of trouble, and which might have been overcome if means had been adopted earlier. *A. Evans, Lythe Hill, Hush.*

FRUITS UNDER GLASS.

EARLY PEACH AND NECTARINE HOUSE.—The fruits of Alexander, Early Beatrice, Early Louise, and other varieties on trees that were started last December will now be approaching ripeness, and it will be advisable to make care, by minute examination, if red-spider is infesting the leaves, and if it should be, a few thorough washings of the trees with soft tepid soapy water by means of the garden engine will eradicate it. It is very essential that this be done prior to the gradual ceasing of syringing the trees during the period of fruit colouring and ripening, otherwise the pest during that brief period will cause very great injury to the foliage, and through that to flavour, besides hindering the growth and maturing of the shoots. Tie in all shoots, and remove leaves where they shade the fruit from sunshine, placing pieces of lath, so as to raise them up to the light, and secure high colour. Give the roots a good soaking of manure water at 90°, the quantity necessary being determined by the condition of the soil of the border. Keep plenty of heat in the hot-water pipes on cloudy days, so as to impart warmth to the air admitted, but carefully avoid having heated pipes during warm sunshiny.

The Second Peach-house.—In this house the final disbudding of shoots, and the thinning of the fruits, may be proceeded with, not retaining more shoots than are absolutely necessary to supply bearing wood, but do this work gradually, and not at one

time, for it should be borne in mind that there is a reciprocity between leaves and roots, and great loss of foliage at a time is calculated to disturb this. In thinning the fruit, the largest and best placed ought to be retained—those growing on the upper sides of the shoots, or such as can be brought up later by means of pieces of lath being preferred. Syringe the trees occasionally with clarified soot-water, or weak soapy water, to deter insects from attacking them. Stimulate root-action by means of liquid manure, and apply a mulching of Mushroom-bed dung, or other decayed solid manure of a similar nature; above all, not putting on mulching materials that would seal the soil; and the older or weaker the tree the more liberal should be the treatment afforded. Young gross growing trees should be stimulated less, or not at all, as conditions may direct. Give air freely in small quantities in all parts of the house; syringe twice daily, and shut up the house before the sun leaves it, allowing a trifling amount of night ventilation at the front when the hot water-pipes are warm.

Late Unbudded Flowers and Peach Cases.—The trees should be thinned and disbudded; and as a preventive of mildew, dust the foliage with flowers-of-sulphur. This malady is generally caused by an atmosphere that is cold and stagnant, or by draughts of cold air. The sulphur may remain for twenty-four hours, and then be washed off with the engine, and the dressing repeated. Fresh sulphide of potassium, applied in a weak solution, ½ oz. to a gallon of water, is also an effective remedy, but it is troublesome to clean off painted woodwork. The sulphide must be excluded from the air till used. *W. Crump, Madresfield Court, Worcester.*

THE KITCHEN GARDEN.

SOWING SALAD PESTIC BEANS.—Where trenches are employed these should be got in readiness, and a few seeds put in for the early crop, but the principal sowing need not be made before the middle of this month, the later sowing frequently catching the earlier ones. The trenches may be 12 feet or more apart, other suitable crops coming between the rows. If the plants are to be pinched at the points, less space will be needed. Prepare the trenches as for Celery, and plant the Beans in pairs, 8 to 10 inches apart in the rows, to be subsequently thinned to one. Carter's Champion and Ne plus Ultra are good varieties, and the latter is as good for exhibition as it is for general consumption.

Thin out the crop of Mibou Turnips to 3 inches apart. Snowball and other larger growers need more space. Spinach and Early Horn Carrots will now need to be thinned, doing this work in showery weather if possible, and before the plants get of large size. Broad Beans may be earthed up, and according to the demand more seed may be planted. Greens of all kinds should be dug up, and the land cleared as soon as there is no more need for them, otherwise the land will be impoverished. Get the Cabbage plots heavily manured and deeply dug, making a fine tilth as the work proceeds.

Asparagus Beds should be kept free from weed; and the produce, as it becomes fit to cut, removed every day with an Asparagus knife, or twisted off—a way of gathering the heads that may be practised on light soils without injury to the crowns. The knife must be used so as not to damage the young shoots beneath the soil. Beds partly exhausted will be much benefited with applications of guano-water, or some salt may be sprinkled on the beds, and the plants not distressed by severe cutting. Flower-pots, a small quantity of leaf-mould or soil may be placed over heads, just showing, to safeguard them against frost.

Let-root. The main crop may now be sown on land free of rank manure, and deeply dug. Sow for this crop in drills 18 inches apart, and thin out early soon after a shower of rain.

Mint. Now is the best time to increase the stock of either Spear or Peppermint. Pieces from 6 to 10 inches, if forked up and dibbled into good soil at 6 inches apart and 10 to 12 inches between the rows will make good beds—watering will be required till the plants are well rooted.

Brussels Sprouts.—Plants early raised in heat, and which may have been pricked and properly hand-dressed off, may be planted out before they get drawn, in an open spot being chosen, and the soil, if of a light nature, should be trodden very firmly about the plants. *H. Mackham, Mereworth Castle, Maidston.*

EDITORIAL NOTICES.

Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor. Such communications should be written on ONE SIDE ONLY OF THE PAPER, and sent as early in the week as possible.

Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are also solicited.

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOWS.

THURSDAY, MAY 8.—Scottish Pram and Arnieola.
SATURDAY, MAY 10.—Crystal Palace.

SALES.

TUESDAY, MAY 6.—(Stock and Greenhouse Plants, Orchids, &c., at the Exeter Nurseries, by Protheroe & Morris (three days).
WEDNESDAY, MAY 7.—(Carnations, Pinks, Greenhouse Plants, &c., at Protheroe & Morris' Rooms.
FRIDAY, MAY 9.—(Established Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—52° 5.

The great Horticultural Exhibition at Berlin, of the plan of which we have already given illustrations, is a great success. It was opened by the EMPRESS on Friday last, and will remain open till May 5. The special feature consists in the association of decorative plants and architecture; but, independently of that, a very fine display of plants has been got together. Among them are several magnificently flowered examples of *Clerodendron Balfouriana*; they are the property of Count HENSEKEL VON DONNERSMAREK, Vendeck, Upper Silesia, and were grown by his gardener, Mr. JOHN FOX. The plants were from 6 to 7 feet in height, a yard or more in diameter, loosely trained in the form of huge cylinders, the branches of blossoms entirely covering the pots, so that from the base to the apex the plants were one mass of white and red blossoms. Mr. FOX also exhibits the only Smooth Cayenne Pine-apples in the Exhibition.

Messrs. SANDER, of St. Albans, make a magnificent display with their Orchids. Among them are some thirty plants of *Cymbidium Lowianum*, with an aggregate of over two thousand flowers; an *Oncidium ampliatum majus*, with over five thousand flowers and buds; *Dendrobium Brymerianum*, 3 feet across; and a group of *Odontoglossum vexillarium* covering the whole side of one wing of the large building. Messrs. SANDER received the highest awards for their enterprise and skill. When we get our

Horticultural Hall, there may be a chance of our once again taking our proper place among the nations. To the toast of the foreign visitors in Berlin we hear that M. HENRY DE VILMORIN replied in as fluent German as he did here in English the other day. M. DE VILMORIN knew how to do his duty to his country in the terrible times of the war. With what different feelings must he have spoken as the representative in Berlin of foreign horticulture! In our next issue we shall be enabled to give further particulars of this important exhibition.

A *Cypripedium* Vote.
The current number of the *Journal des Orchidistes*, of which advance sheets have been courteously forwarded to us by the Editor, M. LUCIEN LINDEN, contains the results of an inquiry which was made to elicit a general opinion as to the merits of particular *Cypripediums*. Our readers will shortly be in possession of the full text, with the reasons that induced M. LINDEN to take a popular vote, so that we need here only say that two main questions were propounded to a number of Orchidists as follows:—

1. What are the twenty-five best *Cypripediums*, species or varieties, arranged in order of merit?
2. What are the twenty-five next best?

Of course, opinions differed upon points of detail, some amateurs placing some species on a higher pedestal than others; but the net result is that the twenty-five best *Cypripediums*, arranged in order of merit, are considered to be the following:—

1. *Stonei*, specially var. *platytenium*, Borneo (fig. 86, p. 548).
2. *Lecanum superbum*, *hyb. insigne Maulei* × *Spicarianum*.
3. *Morganæ*, *hyb. superbiens* × *Stonei* (fig. 85, p. 545).
4. *Argus Noensi*, Philippines.
5. *œanthum superbum*, *hyb. Harrisianum* × *insigne Maulei*.
6. *caudatum*, chiefly the vars. *C. Wallisi* and *gigantum*, Peru, Ecuador.
7. *insigne Chantini*, India (Sylhet).
8. *vexillarium*, *hyb. barbatum* × *Fairieanum*.
9. *Lawrenceanum*, North Borneo.
10. *Schridderæ*, *hyb. caudatum* × *Sedeni*.
11. *microcheilum*, *hyb. niveum* × *Druryi*.
12. *Harrisianum superbum*, *hyb. villosum* × *barbatum*.
13. *Elliottianum*, Philippines.
14. *Spicarianum*, Assam.
15. *grande*, *hyb. longifolium Roelzi* × *caudatum*.
16. *tessellatum porphyreum*, *hyb. concolor* × *barbatum*.
17. *bellatulum*, Indo-China (see fig. 89, p. 556).
18. *Arthurianum*, *hyb. insigne* × *Fairieanum*.
19. *orphanum*, *hyb. barbatum* × *Druryi*.
20. *Curtisi*, Sumatra.
21. *præstans*, Malaya.
22. *Sallieri Hyeannum*, *hyb. villosum* × *insigne*.
23. *nitens superbum*, *hyb. villosum* × *insigne Maulei*.
24. *seltigerum majus*, *hyb. barbatum* × *levigatum*.
25. *Ashburtoniæ expansum*, *hyb. barbatum* × *insigne*.

The next best twenty-five:—

26. *Fairieanum*, Bhotan.
27. *Sedeni candidulum*, *hyb. longifolium* × *Schlimii albidorum*.
28. *superbiens* (Veitchi), Java, Assam.
29. *hirsutissimum*, Assam.
30. *Sanderianum*, Malaya.
31. *gigliare Miteanum*, Philippines.
32. *villosum*, Moulmein.
33. *callosum*, Siam.

34. *barbatum* var. *Warneri*, Malay Archipelago.
35. *Boxalli*, id.
36. *Crossianum*, *hyb. insigne* × *venustum*.
37. *Charles Canham*, *hyb. villosum* × *superbiens*.
38. *Euryandrum*, *hyb. barbatum* × *Stonei*.
39. *Eldorado*, *hyb. argus* × *Lawrenceanum*.
40. *albo-purpureum*, *hyb. Schlimii* × *Domini*.
41. *marmorophyllum*, *hyb. Hookeri* × *barbatum*.
42. *Tautzianum*, *hyb. niveum* × *barbatum*.
43. *Germianum*, *hyb. villosum* × *hirsutissimum*.
44. *niveum*, Moulmein.
45. *Rothschildianum*, New Guinea.
46. *politum*, *hyb. of doubtful origin*.
47. *cardinale*, *hyb. Sedeni* × *Schlimii albidorum*.
48. *calurum*, *hyb. longifolium* × *Sedeni*.
49. *levigatum*, Philippines.
50. *Lowianum*, Sarawak (Borneo).

A large number of those plants have been illustrated in the *Livonia*, and we ourselves have given woodcuts of no small number, from which we now select a few of the best to illustrate M. LINDEN'S *plébisite*.

Other questions were asked concerning the twelve best varieties for cut flowers, and as to what species and varieties should be eliminated from choice collections. The replies to these two questions are too few in number to constitute a fair criterion. It must suffice to say that *C. insigne*, *barbatum*, and *Lawrenceanum*, stand in the order named at the head of the cut-flower section, while only six are marked as unworthy of cultivation, viz., *C. Bullenianum*, *C. turpe*, *C. Mrs. Canham*, *C. Pearcei*, *C. venustum*, and *C. javanicum*.

RE-RATING OF LAND IN RURAL DISTRICTS.

—A meeting of the committee of the Market Gardeners, Nurserymen, and Farmers' Association was held on Tuesday last, April 29, at the offices of the Association, 28, Wellington Street, Strand, W.C., to discuss the question of the rating of land in rural districts, and it was decided that a letter be written to the Local Government Board, requesting them to receive a deputation thereon.

THE DELL.—Of the Orchids in Baron SCHNÖBER'S gem of a garden we have often occasion to speak, but it would be a mistake to suppose that the charms of this garden are confined to Orchids. One of the most extraordinary and most beautiful things to be seen there at present is a huge bush of the old double white *Camellia* some 8 yards across, and 14 to 15 feet high. It originally grew against a kitchen garden wall, a small portion of which still exists, but the bush has long outgrown whatever little shelter this fragment of a wall afforded, and without protection of any kind is in luxuriant health and covered with blossom.

THE ROYAL NATIONAL TULIP SOCIETY.—What is known as the "making-up" meeting of the members of this Society will take place this day, May 3, at the "Bull's Head," near Manchester, to fix the day of exhibition, appoint judges, and revise the schedule of prizes if necessary. The Turner Memorial Trustees offer the following special prizes for competition at the next show:—For twelve distinct named Tulips, six rectified and six breeders, £3, £2, £1; and for six distinct seedling Tulips, three rectified and three breeders, 20s. and 20s. The exhibition will take place, as usual, at the Botanical Gardens, Manchester, and the date will be announced immediately after the meeting.

NEW ZEALAND INTERNATIONAL EXHIBITION, 1890.—We learn from the *Otago Daily Times* of March 6, that the firm of Messrs. SCOTCH & SONS, Reading, received the following awards:—(First-class: Preserved fodder and substances specially cultivated for food for cattle; collection of models of vegetables, and of agricultural roots from Nature; and for collective exhibits a special award of the

First-class. Messrs. HENRÉ & SONS, Houndsditch, London, and Messrs. ARTHUR YATES & Co., Manchester, received likewise First-class awards.

THE FRENCH EXHIBITION.—This exhibition, which will be opened at West Brompton on the 17th inst., promises to be one of great interest. Vegetable products are curiously mixed up in Group I, with fashions and dress.

BRITISH FRUIT GROWERS' ASSOCIATION.—The Duke of Bedford has contributed £25 to the Asso-

Winchester; 9, Brighton, Diss, Ealing, Tunbridge Wells; 10, Birkenhead, Workop; 12, New Brighton; 17, Birmingham (N. R. S.), Helensburgh; 22, Tibshelf. In the case of Brighton and Winchester, where the shows extend over more than one day, the date of the first day's show only is given.

DAFFODIL SELECTION.—The Royal Horticultural Society has issued a circular asking for information upon the following points: 1. The best twelve single yellow and bicolor Ajax, for exhibition. 2. The next best twelve (as above). 3. The six best

VILLE. After a preliminary chapter devoted to the history of this wonderful undertaking, so honourable to the French nation, the author gives a general description of the whole Exhibition, and then in succession gives chapters relating to the preparatory labours, the formation of the parks and gardens, the machinery gallery, the galleries of fine arts, &c. the motor and hydraulic powers, the luminous fountains, the electric supply, the Eiffel Tower, canals, lighthouses, the forest pavilion, statistical and other matters—in fine, a complete account, illustrated by no fewer than 700 woodcuts. We shall take

FIG. 28.—PEACH HOUSE AT MESSRS. T. BURLIN AND SONS, BENTLEY, KENT. (SEE P. 551.)

ciation for the purpose of opening a fund for the purpose of preparing and publishing a report upon the present condition and prospects of fruit culture in Great Britain and Ireland.

DATES OF ROSE SHOWS IN THE PRESENT YEAR.—The Rose season is approaching, and in view of this fact, Mr. EDWARD MAWLEY, Rosebank, Great Berkhamsted, sends us the following fixtures:—June 19, Ryde; 24, Drill Hall, Westminster (N. R. S.); 25, Richmond, Surrey; 27, Royal Aquarium; 28, Eltham, Bigate; July 1, Canterbury, Hereford, Sutton; 2, Brockham, Croydon, Dursley, Hitchin; 3, Bath, Farningham, Norwich; 5, Crystal Palace (N. R. S.); 8, Gloucester, Ipswich,

single White Ajax. 4. The six best doubles for general purposes. 5. The twelve best single, for exhibition, of all other classes from incomparabilis to Jonquilla (Polyanthus excluded). 6. The next best twelve (as above). 7. The six best Polyanthus for outdoors. 8. The twelve best Ajax for garden effect, having regard to constitution, vigour, and varied season. 9. The twelve best of other classes (as above). The replies will be incorporated with the Conference Report.

THE PARIS EXHIBITION.—M. ROTHSCHILD, 13, Rue des Saints Peres, Paris, has published a dainty yet exhaustive souvenir of the great Paris Exhibition. It is prepared by M. HENRI DE PAR-

another opportunity of alluding to this remarkable publication, published with all the completeness and care for which M. ROTHSCHILD is well known.

THE GARDENERS' ORPHAN FUND.—The monthly meeting of the Committee took place at the Caledonian Hotel, Adelphi, on April 25, Mr. C. H. SHARMAN presiding, in the absence of Mr. GEORGE DEAL, who was unfortunately too unwell to be present. The minutes of the last meeting having been read, a resolution of sympathy with Mr. DEAL was passed by acclamation, and the same ordered to be sent to Mr. DEAL. The balance at the bank in favour of the fund was stated to be £335 12s. 10d., in addition to £300 on deposit. The following candidates,

nominated for election in July next, were accepted, their credentials being found satisfactory:—

Alfred H. Badd, Kingston Road, Ewell, aged 8 years.
Winifred Jones, Fern Lodge, Aitcham, Shrewsbury, aged 7 years.
Robert Jas. Phillips, Eridge Green, Tunbridge Wells, aged 7 years.
Arthur J. Rowland, Grange Farm, Crawley Down, aged 8 years.
Geo. P. Shrubb, 57, Thurlow Hill, West Norwood, aged 7 years.
Susan E. Barker, 31, Prospect Road, Cheshunt, aged 8 years.
George Beveridge, S. Wells Street, Paisley, aged 2 years.
Evans E. Kinch, Margam Post, Talbot Road, aged 10 years.
Sidney A. Oller, Ashford Terrace, Fordingbridge, aged 6 years.
Francis Thos. Bragdon, East Coker, Yeovil, aged 4 years.
William H. Milne, Walpole Street, Peterborough, aged 2 years.

The following candidates, unsuccessful at the last election, were also added to the list:—

Frank Butcher	aged 7 years.
Bessie S. Deedman	" 8 ..
Mary Grieve	" 10 ..
Arthur Lacey	" 4 ..
H. E. Skelton	" 7 ..
Thomas Henderson	" 7 ..

making seventeen candidates, from which ten are to be elected. The form of the voting-paper and other preliminaries were agreed to. A sub-committee, consisting of Messrs. A. F. Barron, R. Dean, and B. Wynne, were appointed to arrange the preliminaries of the dinner. Subsequently a meeting of the joint-committee, to carry out the arrangements of the approaching Floral Fête in the Wholesale Flower Market in aid of the Fund, was held, Mr. ASBEE presiding, the standholders being well represented. Many details were arranged, and it was announced that H.R.H. the Princess Mary, Duchess of Teck, the Duchess of Portland, the Duchess of Abercorn, the Marchioness of Salisbury, and the Marchioness of Tavistock, among others, had permitted their names to be announced as patronesses of the Fête. The proceedings closed with a vote of thanks to the chairman.

CŒLOGYNE LOWIANA.—The magnificent plant of this Orchid, at Baron SCHROEDER'S, measures about 5 feet across, and has at the present time twenty-nine spikes, with an average of thirty flowers to each spike. The rich colour of the lip is also remarkable.

ODONTOGLOSSUM LILIFLORUM.—This plant, now in bloom at Baron SCHROEDER'S, at first sight is so unlike an Odonoglossum, that it might well be considered to belong to a different genus. The flower-stalk is erect, and bears a many-flowered panicle of lilac-spotted flowers. It is sometimes considered to be a variety of *O. ramossimum*.

WARE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—This Society has held two successful meetings during the past month. The first was held on April 9, R. WALTERS, Esq., in the chair. Mr. W. OSBORNE submitted a very practical paper on "Potatoes." A capital discussion followed. Some good dishes of Potatoes were exhibited by Messrs. Fulford & Adams. A hearty vote of thanks was accorded the essayist. On April 22, the date of the last meeting, Mr. G. FERRON in the chair, there was a good attendance of members and visitors to hear a paper read by Mr. W. KING on "The Greenhouse and its Occupants," and which induced a lengthy discussion. A group of *Azalea mollis* and *Spiræas* was staged by Mr. RILING, and some very fine Pansies by Mr. GRIT

Notes of thanks to the chairman and essayist terminated the meeting.

PARAGUAY.—M. PAUL MAURY has published a monograph of the Cyperaceæ of Paraguay in the *Mémoires de la Société de Physique et d'Histoire Naturelle de Geneva*, illustrated by numerous lithographic plates.

LIBOCEDRUS DECURRENS.—The finest specimen of this handsome tree that we have met with, is in the garden of Baron SCHROEDER at Egham. Its rich dark green foliage and columnar habit, apart from more recedite differences, separate it from *Thuia gigantea*—a name once applied to it in error.

SPANISH HONDURAS.—An expedition, under the direction of General LEVEN, is about to proceed to the Republic of Honduras, to investigate the resources of the country. Mr. JAMES COLLINS will accompany the expedition, and report specially upon vegetable products, india-rubber and balata.

FERNANDO NORONHA.—Mr. RIDLEY'S account of the botany of this Brazilian island, read to the Linnean Society on June 7, 1888, appeared in print in a number of the *Journal* dated April 5, 1890. Horticulturists accustomed to the rapid publications of the weekly press grumble at the delay in publishing Conference papers in the *Journal of the Royal Horticultural Society* when that delay is only for a quarter of a year; but were they Linneans, they would have to wait a much longer time. In the present instance, it is not unlikely that the delay was partly caused by Mr. RIDLEY'S absence in Singapore.

DOUBLE FLOWERS.—In a communication to the *Botanisch Jaarboek*, Professor McLEOD and Mr. G. VAN ECKBAUTE, of the Ghent Botanic Garden, have published the results of their experiments made with a view of testing the correctness of some of Dr. NOBBE'S conclusions. As we have already noted in these columns, Dr. NOBBE maintained that seeds of Stock (*Matthiola*), the germination of which was rapid, produced more vigorous seedlings, and, moreover, a larger proportion of double flowers, than in cases where the period of germination is prolonged. The Flemish observers amply confirm Professor NOBBE'S conclusions, as is shown by their statistical tables. Similar conclusions, with differences of detail dependent on the different morphological structure of the flower, were observable in Delphinium. Nothing is said about the supposed influence of mites in the production of double flowers, and, indeed, the experiments now recorded seem to be inconsistent with any debilitating process such as would be brought about by insect injury.

CONSETT PARK.—We mentioned in our issue of April 12, that Mr. DUNGAN SMITH had been engaged by the Consett Iron Co., to lay out the park. In justice to Messrs. J. ROSSON & SON, Nurserymen, of Hexham, we desire to inform our readers that this well-known firm is laying out the park, and supplying trees and shrubs, Mr. D. SMITH being specially engaged to carry out the work.

PROTECTION.—In a report to the Chamber of Commerce of Ghent, M. ED. PANSART points to the danger looming before the Belgian cultivators by the proposal of the French Government to impose an import duty upon Belgian flowers and fruits in the supposed interests of French horticulturists.

FERTILISATION OF FLOWERS.—In the last volume of the *Botanisch Jaarboek*, published under the auspices of the Dodonea Society of Ghent, Professor McLEOD gives a list of books and memoirs relating to the fertilisation of flowers published since the catalogue compiled by Mr. D'ANCY W. THOMSON in 1883, and inserted as an appendix to the translation of MULLER'S *Befruchtung*. The literature of this, as of other special subjects, has become so vast that, without such aid as Professor

McLEOD has afforded, it would be quite impossible for any individual to know what has been written on a particular subject. In the present list no fewer than 638 publications are catalogued, the author explaining that the list is not to be considered as complete, especially as regards American literature.

A CATALOGUE OF JAPANESE PLANTS.—It is not often that we can do more than acknowledge the receipt of a trade catalogue, but we are induced to depart from our usual rule in the case of Mr. LOUIS BOENNER'S price list of Japanese bulbs, plants, seeds, &c. Apart from the intrinsic interest and abundance of the subjects catalogued, a word of praise is due for the singularity and elegance of the catalogue, which is itself a pretty "curio," and is printed on a coarse-grained but very tough yet pliable paper, and enclosed in a coloured Japanese cover. Mr. BOENNER'S address is 4, Bluff, Yokohama, Japan.

M. HOULLET.—We see in the current number of the *Revue Horticole* an announcement of the death of this famous horticulturist at the age of seventy-five. He was attached to a scientific expedition in Brazil, headed by GUILLEMIN, and was for many years Curator of the Jardin des Plantes (indoor department), under M. DEBAINSE. His name will be commemorated by the genus *Houlletia*.

SPANISH PLANTS.—Dr. MIGUEL COLMEIRO, Director of the Botanic Garden at Madrid, has published five volumes, comprising a complete description of all the plants of Spain, Portugal, and the Balearic Islands. The first volume was published in 1885, the fifth in 1889.

VEGETABLE AND FRUIT FARMING.—Mr. CHARLES WHITEHEAD has reprinted from the *Journal of the Royal Agricultural Society* a reprint of his hints on vegetable and fruit farming, a useful compilation, which may be had from Mr. MERRILL, Albemarle Street.

"THE FLORA OF BRITISH INDIA."—Sir JOSEPH HOOKER has just issued Part 16 of this most useful work. The present part will be specially valuable to orchidists, for it contains a descriptive account of a large proportion of the Orchids of British India—the remainder will be given in the following parts. Among the genera treated of in the present part are *Dendrobium*, of which no fewer than 158 species are described. Sir JOSEPH says that his arrangement of the Indian species "is open to much criticism in detail," but he goes on to say that "it has entailed many months of labour, and it must stand or fall according to the verdict of those who may use it. The species are divided first of all into two series, those in which the inflorescence is terminal (sympodial), and those in which it is lateral. The sections are further distinguished by the "habit" and by the conformation of the flower. Nearly eighty species of *Balophyllum* are described, thirty-four of *Cirropetalum*, ninety-four of *Eria*, fifty-five of *Cologyne*, thirty-four of *Calanthe*, whilst the other genera enumerated have fewer species. There is no one now who has had such experience and such opportunities as Sir JOSEPH HOOKER, whilst no one certainly has such competence to turn the advantages to good account. We may, therefore, confidently congratulate orchidists on the appearance of this publication, and look forward with eagerness to its speedy completion.

CHINESE PLANTS.—The enumeration of Chinese plants compiled by F. B. FORBES and W. B. HEMSLEY, in course of publication in the *Journal of the Linnean Society*, has now got as far as *Bignoniaceæ*. The twenty-sixth volume of the *Journal* of the Society will be reserved for this useful publication. The newly described species are by Mr. HEMSLEY, and among them are several of horticultural as well as botanical interest.

PUBLICATIONS RECEIVED.—*Annals of Bird Life*, by CHARLES DIXON. (London: Chapman & Hall, Limited.)—*Complete Press Directory for 1890*. (London: SHEELLY & Co., 5, 1/2-Edinborough Street.)

PEACH GROWING.

WHENCE comes, we have often wondered, the supply of Peaches that are always to be found in fair abundance in our fruit shops? That they are not grown to anything like the extent Grapes and other fruits are, may be true, and one very rarely finds them to any extent in our market gardens. Is it that Peach growing requires more skill and care, and is a little more difficult to accomplish? or, is it that their culture does not pay so well as other fruits? It must be admitted that Peaches do require some special care and attention at certain periods, and we are afraid that on this account their culture is, to some extent, neglected. That they will pay to grow we have the very best evidence in the high prices that have always to be paid for the fruits.

One of the prettiest sights we have lately seen in the fruit way was the handsome Peach trees in their full blaze of floral beauty in Mr. T. Barton & Sons' gardens at Bexley Heath. Peach blossom is always beautiful, and here were several large houses in full bloom, and altogether charming. We were impressed also by the large size of the blossom, and its great depth of colour, the large size being a good indicator of large fruits to come.

Mr. Barton combines with his business as a hot-house builder the cultivation of Peaches and some other produce for market, and right well they are managed. If extra skill and attention be required in their cultivation, it is here found. The trees throughout are perfect models of health and strength.

The first house is a span-roofed one, 220 feet long, the trees trained to a trellis on both sides, and planted about 10 feet apart, every one occupying its allotted space, and in perfect order. We are afraid to say how many fruits are annually gathered from this one house, but some of the fruits, we were informed, weighed over 21 oz.—many of them over 18 oz.

In the next house, which is 112 feet long by 21 feet broad, the trees are planted out and grown in the most natural bush form. We have never seen larger or better examples of this mode of growth, the average size of the trees being about 10 feet high and 15 feet across. From one tree, we were told, as many as 300 fruits were gathered last year. Originally this house was much smaller, but as the trees grew up, Mr. Barton built another house over the smaller, which was then removed. Mr. Barton commences sending fruit to market early in June. In the month of July as many as 172 dozen have been sent in one week, realizing good prices. See fig. 88, p. 553.

SILK.

The Silk Association of Great Britain and Ireland will in a few days (the 6th inst.) hold an exhibition of articles of British manufacture, in a large number of specimens, in the mansion, No. 6, St. James's Square, W. Besides manufacturers' gowns, many noble ladies, we are informed, will furnish specimens of this beautiful fabric, suitable for various purposes, personal and home decoration, and doubtless the necessities of the electric light—now so largely employed in the lighting of West-end mansions—will be catered for by our more enterprising manufacturers. And when all is over, possibly the question of Mulberry tree culture as an English economy may once again force itself to the front, as it did in the halcyon days of James I., when George Heriot was a court goldsmith, and a money-lender, and to whom the citizens of Edinburgh are so largely indebted. The question of this new-old culture may safely be left to the decision of those who have speculated, and such as may patriotically grapple with it once more—if any such are to be found; certainly we do not think any large amount of capital would be subscribed now-a-days for the purpose.

This Exhibition will be found interesting from another point of view, and one is the capacity of

silks for the illustration of the uses of vegetable fabrics; and now that walls and ceilings of mansions are panelled with silk, it would certainly appear that efforts are being made to use something more than combinations of colours for such kinds of decoration. One may find on the 6th inst. that botany has been subsidised by the British manufacturer. Conventional botanical illustrations have hitherto often been mere rubbish in so far as design was concerned, but now many beautiful draperies in silk may be seen; not always correct, certainly, as to drawing, or in the weaving, and whether of English or French origin is not generally known. And here is the "rub." It is desired to bring silks of English manufacture to the front, as being equal, if not superior to French, or Italian, or Indian, or Chinese, &c. And this effort deserves the hearty co-operation of all patriotic men—and ladies.

It is claimed by some manufacturers we know of, that our dyes—we cannot say very fast ones now-a-days—are unexcelled; that in the matter of plushes and velvets we stand alone. This may be so; certainly the qualities are gorgeous. And in the matter of economy, ask our friends in the North—say, by the Clyde side—what they fabricate from the "ends" that were formerly of such little use when they procure these moles and chenille curtains. The gouty threads of Eastern raw silk have stimulated the ingenuity of our inventors, and now the automatic fingers stop the wandering of costly silk so soon as a knob is encountered in the process. Very many of our readers will doubtless avail themselves of admission to the St. James's Square ball room, and will judge for themselves on all the matters above mentioned. English ladies, certainly excellent judges in most matters, will fail in this instance. Raw silk from the East is very largely used here—much of it from an uncultivated worm. There are many observers now roaming over the Indian Archipelago and other places, promising surprises, or new sources of supply of articles of known value; it is to be hoped that an observant botanist or two may be found amongst the commercial roammers who possess an eye to the evolution of silk and the fool of the evolutionists. Our Antipodean colonists might find it to their interest to bestow more attention on the culture of the Mulberry tree and the breeding of the silkworm than they have done.

From a recently issued Consular report on the trade of Italy, we glean the following particulars respecting silk. In passing it may be remarked that, although this document consists of only eighteen pages of letter-press, the compiler has in them stored away a wonderful amount of statistical material. He says: "In the year 1858-1859 over 50,000 quintals (equal to 100 lbs.) of raw silk were exported from Italy, which, together with the amount of cocoons from 9-100ths of the product exported under the denomination of materials necessary for industries, about 32,000,000 fr., or 642,800,000 sterling. The silk imported is considerably in a very favourable condition, both in a raw and in a manufactured state, while the import is steadily decreasing."

As to the *U. S.* aspect of the subject, doubtless information could be obtained from the President of the Association, Thomas Wardle, Esq., F.C.S., F.G.S., Leek.

BOOK NOTICE.

GIMPSES INTO NATURE'S SECRETS By E. A. Martin. (Published by Elliot Stock.)

A SMALL book, which is partly composed of articles contributed by the author to various magazines. We have seen many similar volumes, but this one seems very pleasantly and readably written, and as it treats of the natural history treasures to be found at certain well-known watering-places, should accompany those travellers who like to improve their holiday by learning a little about the beauties around them in an

easy way, without referring to bulky scientific treatises. The geology of cliffs and downs is one of the many studies touched upon by the author, who by the way admits that he regards the eating of oysters with a "feeling akin to disgust," and tries to shock the "maggoty-cheese-eater and his kin" by an appalling account of the diet of some of these "animals" which are specially bred for market. Whether vegetables and fruits that have been highly manured are equally revolting, we are not informed.

PLANTS IN FLOWER AT KEW.

CROTALARIA PENNINGHAMII (Temperate-house).—This is the "Green Bird Flower" of West Australia, where it is found only on the dry, almost desert regions from Shark's Bay to the Gulf of Carpentaria, and southwards towards Spencer's Gulf. Seeds of it were received at Kew five years ago, and from them the plant now in flower was obtained. It has an erect stem 6 feet high, branched near the top, the branches bearing ovate, entire leaves, 2½ inches long, and clothed on both sides with a soft silvery down. The flowers are in erect, compact, terminal racemes, and they are similar in form to the common species, their length being 1½ inch. Their most remarkable character is their colour, a rich peacock-blue, with numerous longitudinal lines of a darker shade on all the segments. There are very few leguminous plants in which the flowers are large and of a green colour. A badly-coloured figure of this *Crotalaria* was published in the *Botanical Magazine*, t. 3740, and was prepared from a plant flowered in Wilson Saunders's garden in 1860.

BIBIS (*metron* Benth. Stove).—This is probably a new species. It has stems 3 feet high, clothed with the persistent bases of the old leaves. The foliage resembles that of *B. purpurea*, an old garden plant, introduced as a waif by Dean Herbert, and figured in the *Botanical Magazine*, t. 2777. The scape of the unanthered plant is semi-erect, 1 foot long, smooth, green, and one-flowered. The flower is 1½ inch across, and is composed of six lanceolate, reflexed segments of rich vermilion attached to a trigonous green tube three-quarters of an inch long. The clusters of old flower-scapes on the stems indicate a free-flowering character in this plant. The *Barbaeniensis* and their near allies, the *Vellozias*, form an interesting tribe of the *Amaryllidaceae*, and many of the species are ornamental. Of the seventy or so species described, scarcely half a dozen have been brought into cultivation. They abound in Brazil, where the *Vellozias* form conspicuous objects in the mountainous regions, some of them being tree-like in dimensions. Young plants, five years old, of one of these arboreal species, are in cultivation at Kew, having been raised from seeds presented by the recently deposed Emperor of Brazil. Collectors in Brazil ought to gather seeds of these plants, and of the *Barbaeniensis* whenever met with.

CALCEOLARIA PURPUREANSIS (Stove). This distinct species was introduced from West Tropical Africa in the time of Dean Herbert, who described it in his *Amaryllidaceae*, stating that it is "of easy culture, and increases fast by offsets, but it is not stoloniferous." It was re-introduced about ten years ago, when a plant which flowered at Kew was figured in the *Botanical Magazine*, t. 6525. Notwithstanding Herbert's opinion that this species would be easy of culture, it has never been kept long, and until Mr. Horsman obtained a consignment of bulbs of it from Africa last year, it was often asked for, but never seen in gardens. One of the Kew plants obtained from Mr. Horsman, Colchester, is now in flower. The leaves are narrow, wavy, and dark green; the scape is a foot long, somewhat flattened, and purplish in colour; the flowers, of which there are six in an umbel, are rich purple on the tube and outside the segments, white inside. The tube is 6 inches long, very slender, and the segments, which are narrow, and 3 inches long, are spreading and recurved. The stamens are curved, with crimson filaments and dark purple anthers; the stigma also

is crimson. Herbert appears to have erred in stating that this species was not stoloniferous; on the contrary, we find it is the most stoloniferous of any *Crinum* cultivated at Kew, the thick, fleshy stolons pushing freely from the base of the bulb, and pushing up leaves in a remarkably short time. Apparently this species likes to be kept saturated at the roots. It is said to grow at a low level by the side of streams about Fernando Po and in Old Calabar. Generally we find African bulbous plants like a season of dry rest, and probably it has been through applying this treatment to *C. purpurascens* that it has hitherto failed in cultivation.

Eurycles.—This genus of Australian bulbous plants is represented by only two species, viz., *E. sylvestris* and *E. Cunninghamii*, both of which are now in flower in the stove at Kew. The former has flowers almost as large as those of *Eucharis amazonica*, and not unlike them in form; indeed, so far as flowers and foliage go, there is less difference between these two genera than there is between, for instance, *Eucharis amazonica* and *E. subdentata*. A comparison of the descriptions of *Eucharis* and *Eurycles*, as given in Baker's *Amaryllidaceae*, show that they are not separated by any well-marked character. Whatever the name, the two species of *Eurycles* are good garden plants, flowering freely under liberal cultivation. The flowers are white, and borne in umbels on erect scapes. In *E. sylvestris* they are 3 inches across, and about 1½ inch in *E. Cunninghamii*.

Orchids.—The most interesting of these now in flower are *Saundersia mirabilis*, *Arides Wightianum*, *Cottonia macrostachya*, *Disa racemosa*, *Satyrion princeps*, *Caladenia Patersoni*, *Masdevallia pulvinaria*, *Epidendrum bicoloratum*, *Sarcochilus Berkeleyi*, *Laelia lobata*, *Phaius Mannii*, and *Cologynia pandurata*. *W. W.*

NURSERY NOTES.

ORCHIDS AT MESSRS. J. VEITCH & SONS'

At the above nursery at Chelsea, no difficulty is experienced in making a special display of Orchids in bloom, in the manner that has of late become fashionable early in May, and continuing generally through the season. The houses occupied at one time by seedling Orchids, now removed to the country, are at present filled with *Odontoglossums*, *Masdevallias*, and other dwarf-growing Orchids, and rare species which are on trial; and further, the large and very valuable stock of seedling Orchids, which is still in the care of Mr. Seden, afford many objects of beauty and interest not previously seen.

In the cool houses were found numbers of fine forms of *Odontoglossum crispum*, some having very strong spikes; large specimens of *O. Hallii* and *O. triumphans*, one of the latter bearing seven spikes, the fine old *O. Uro-Skinneri*, some stout spikes of *Odontium macranthum*, *O. superbium*, and the curious *O. insculptum*; several hybrid *Odontoglossums* to which no names are assigned, and notably one with pretty white and purple flowers, having likeness to *O. Lucianianum*, but the shape of *O. Coradinei*. Some *Ada aurantiaca*, *Oncidium* concolor, and scarlet *Sophranitis* assist the brightly-coloured *Masdevallias* most effectively in the arrangement. Among the latter were two which demand notice—the pretty *M. caudato-Estradae*, and a curious species of the *M. chimera* section near to *M. spectrum*.

The rockery-house has many specimens in flower, inclusive of several large *Dendrobium* noble that were most attractive. Plants of *Cyrtopidium caudatum* with seven and more flowers each, and the true *C. barbatum nigrum*, with fifteen flowers, are objects of much beauty. One of the most interesting and beautiful plants now in bloom is *Cologynia tomentosa*, with three spikes, and which until recently was only known through a dried specimen sent by Lobb when he was collecting for Messrs. Veitch. Its flowers are equal to, and produced in the same

manner as those of *C. Massangeana*, a plant of which was in bloom alongside of it. An attractive feature in *C. tomentosa* is the delicate salmon tint which the sepals and petals take on when the flowers are a day or two old. Among the other fine specimens in the rockery-house were *Odontoglossum pulchellum*, with forty spikes; *O. citrosium*, ranging from white to rose colour; *Bifrenaria Harrisoniae*, still well in bloom; *Epidendrum leucocidium*, with several heads of large green and white flowers; *Calanthe veratrifolia australis*, a very strong grower, with large heads of snow-white flowers; various *Oncidium*s, one of the most curious being *O. fimbriatum*; *Maxillaria Sanderiana*, *Vanda suavis Veitchii*, the fine *Oncidium luridum*, *O. tetrapetalum*, and *O. ampliatum majus*. The arrangement in this house displays the *Dendrobies* capitally, one fine specimen of *D. suavisimum* having nine spikes, and *D. dixanthum*, *D. Dalhousianum*, *D. Farmeri*, *D. cretaceum*, *D. tortile*, *D. primuminum*, *D. aggregatum majus*, *D. Draconis*, *D. Parishii*, and others being used in varying numbers. Here, too, was a flowering plant of *D. atroviolaceum*, the latest introduction of Messrs. Veitch, and which has improved since it was exhibited at the Royal Horticultural Society's meeting, its flowers having become larger, the creamy white clearer, and the violet

FIG. 19.—*CYRTOPIIDIUM BELLATULUM*. (SILVER, 552.)

markings brighter. It is an acquisition of some beauty.

The Cattleya-house displayed *Laelia purpurata* in quantity, and one specimen of the rare *L. p. Russelliana*; many of the pretty *Cattleya Schroderae*, *C. Lawrenceana*, *C. Regnellii*, and a most beautiful strain of *C. Mendelii*, whose tints range from the delicate ones of *C. Morganae* to the richly coloured type of which *C. M. Rothschildiana* is perhaps the best example.

The *Phalenopsis*-house was rendered beautiful by noble sprays of *P. anabilis* and *P. grandiflora*; by the *Phalenopsis* of smaller growth adding their share of beauty. Of *Angraecum modestum* there were some fine sprays, one of *A. Ellisii* and several of *A. Leonis*.

The *Cyrtopidium*s of many species and varieties were in bloom; and among them the last hybrid of Messrs. Veitch's raising, obtained by intercrossing *C. philippinense* and *C. villosum*, and which was prematurely exhibited at the Royal Horticultural Society, since which time it has improved. *C. Mrs. Canham* was another new hybrid noticed with large and striking flowers; *C. virens*, also observed, is a very different plant from the form of *C. javanicum* usually seen under that name. Other specially noteworthy things were *Epidendrum O'Brienianum* ×, with carmine-crimson flowers, and which with its progenitors was illustrated in the *Gardeners' Chronicle*, June 23, 1888, very well grown and flowered; *Diacrium bicoloratum*, the curious *Epi-*

dendrum bicoloratum, and *Cattleya calumnata* ×, Chelsea variety.

The house containing varieties of *Anthurium Schottianum* was a brilliant spectacle, and the *Nepenthes* and other specialities were found up to their usual excellence.

HOME CORRESPONDENCE.

PRIMULA SIEBOLDII.—As one of the chief functions of horticultural conferences is to bring about uniformity of nomenclature, by correcting wrong names, I call attention to this name. It was unfortunately not until I had read my notes to the public that I observed that the *Primrose* which I had described as *P. cortusoides* var. *ameana* was labelled on the stage, in the very fine series exhibited by Mr. Deyer, *P. Sieboldii*. According to the laws of botanical nomenclature, the name of a variety should not be substituted for the specific name, but added after it. Therefore, the question of priority has to be decided between *P. cortusoides* v. *ameana* and *P. cortusoides* v. *Sieboldii*. I find in Mr. Dewar's carefully compiled list of names at the end of the Report of the *Primula* Conference of 1886 that *P. cortusoides* v. *Sieboldii* (*Morren*) is preferred to *P. cort. v. amœna* (*hortorum*), so I ought to have adopted that name in preference to the name I used, and I wish to correct my error. As there is another *P. amœna* (*M. B.*) in the catalogue, ambiguity is avoided by this correction. *C. Wulley Dod, Edge Hall, Malpas.*

LAXTON'S NOBLE STRAWBERRY.—To those who have not forced this variety I would say, try it; to those who have tried it and failed, I would say, try it again. This is my third year's experience of it. I put ninety-six pots of it into a very temperate house the last week in January, on shelves near the glass. This house was occupied by a crop of French Beans up to the end of February, when the temperature was raised for a crop of Melons to 68° by night and 75° by day. As soon as the Strawberry fruits showed colour they were removed to a cooler house. I have now eighty-three pots out of the ninety-six pots put in which are fruiting, and of these there are eight fruits to a pot, on an average, but eleven is the highest number. The first dish was picked on April 15, running twenty-eight fruits to the pound avoirdupois. The first picking is generally looked upon as being the best, but these fruits were not the largest. I shall have from this batch of plants. The largest fruit measured 5½ inches in circumference, and all were of fine colour and shape, and quite free from any trace of mildew. I am forcing several hundreds of pots of Noble which look equally promising. My employer speaks highly of its flavour. *B. Latham, Croxteth.*

—This variety in appearance does not belie its name, and it is, moreover, a free cropper and setter in pots, and ripens very early, but I cannot praise the flavour of the fruit. Poorness of flavour will hardly be considered by growers for market, who are sure to cultivate it largely for its showiness, and it is certain to take the popular fancy. Outdoors it was the first to ripen with us last year, being ahead of Keen's Seedling, *Vicomtesse Héricart de Thury*, and *King of the Earlies*, the last-named being in a bed alongside one of Noble, and therefore under the same conditions. *King of the Earlies* is too small, and looks very like *Cuthill's Black Prince*, a variety hardly ever seen or heard of now. *J. Sheppard.*

APHIS ON PEACH AND OTHER FRUIT TREES.

—At this season Peach and Plum trees rapidly get infested with aphid, and require careful attention as soon as discovered, so as to dislodge them. Some varieties of the Peach and Plum are more liable to be attacked by these and other insects than are some others, this being especially true of weak growers, strong, free-growing trees being less liable to be attacked; situation, too, has a good deal to do with the presence of aphid on the young growth of fruit trees, and those growing in sheltered, warm positions are more likely to be attacked, and at an earlier period than those in exposed places even in the same garden. The best remedy against aphid is a solution of water and tobacco-juice, at the rate of 1 quart of the latter to 4 gallons of the former, applying it with a syringe when the sun has left the trees for

the day. Morello Cherries may be syringed in the morning if the trees are on a wall facing north, as the leaves are not exposed to direct sunlight; however, the insecticide is best applied on a sunless day, as it does not then dry so quickly. If the trees are attended to before the aphid effect a firm hold on the leaves by becoming enveloped in them, one application of the tobacco-water will generally prove sufficient for the season, killing the fly, and rendering the leaves distasteful to insects generally. The black aphid, which greatly infests the points of young shoots of Cherries, can only be got rid of by repeated applications of the remedy. *H. W. Wood.*

the Society. To many I would say: Do not be afraid of giving because you cannot give what others do; give what you can. If you cannot put down what you would like to give, give a part this year and give again next year. I think the sceptical will be surprised at the success which will follow our securing a place of our own. Meanwhile I am thankful for the haven of refuge afforded us by the Drill Hall. *J. A. C., April 27.*

REMOVING VINE FOLIAGE—I remember Mr. Robert Thompson telling me forty years ago that it was quite a mistake cutting away the leaves of Vines

grains soon make root when laid on the ground. In the market-growing districts, because of the enormous quantity of stable manure available at this particular season, it is the rule to dress Strawberry beds with the longest shaken out, and specially reserved for the purpose. This having been well trodden in the stable and also repeatedly shaken, is free from grain and seeds of weeds. Laid down almost as soon as it is brought from London, the straw thus becomes washed free from impurities; still, during a dry time it is very little tarnished, whilst being well beaten it is more fitted for the purpose than is clean long straw. Various substitutes for straw or lay litter have been proposed, but few have been found worthy of adoption. Green grass is apt to breed weeds and to generate insects and vermin. Cocoa fibre refuse is too costly, and not at all satisfactory; indeed, there seems to be no material which is more fitly adapted for the object in view, than is well-trodden but fairly clean straw litter. *A. D.*

DOUBLE POET'S NARCISSUS GOING BLIND.—We have annually in the gardening journals a discussion on the cause of this. If my theory is correct, that it is caused by the generation of steam within the air-tight spathe, it is preventable by pinching off or cutting off the tip of the spathe as soon as long enough. If a few growers would try this plan on part of their bulbs, it would settle the question so far. The failure is so rare in my cold climate, that experiments there would prove nothing. *C. W. Dod, Elge Hall.*

ANEMONE FULGENS.—Like Mr. Divers, of Ketton Hall, I do not find this plant fail after the second year, but quite the contrary; a patch of it in the garden here, planted four or five years ago, increases every year both in size and strength, without anything whatever being done to encourage it. It has been in flower ever since Christmas, and during that time has been subjected more than once to 10° of frost without having the flowers in the least injured thereby. *C. W. Spickland.*

PEACHES AND NECTARINES OUTSIDE.—The cold, sunless weather has been too much for outdoor Peaches and Nectarines, which, up to the middle of April, looked very promising, the flowers strong, and which set well, but the fruit remains stationary, and now begins to look pinched and yellow; still a quick change to sunshine and warmth may alter all this, and give us a crop. Fortunately, the weather was very dry at the time, or the cold would have done serious harm, and it is remarkable that the trees are now so clean, slow growth often inviting the aphid plague; but this is absent, as is also the emul. Disbudding will soon be finished, and then the engine will be brought into play. If aphides should show themselves, we first of all puff tobacco-dust into the points of the shoots, and the insects are then easily washed off, and the tobacco-dust is safer than the liquid insecticides at this early stage, for even the best of these are apt to injure the young fruits, especially Peaches. In disbudding, I like to have every shoot on the upper side of the branch, and always leave the best situated one that is near the base of the branch, and no other except that at the end, unless there is some bare wall to cover; and by thinning thus there is little pruning required in the winter, and never any crowding of shoots, and all get well exposed and ripen perfectly. To have the shoots nice and close where they start, without those objectionable elbows at that particular part we too often see, a man gives the shoot a tie at that point, and after that the training is mostly done with Privet twigs, as our walls are all wired in diamond mesh of 6 inches. *J. Sheppard.*

MANURES.—Many artificial manures are now in the market, and circulars pour in by post, so that one is apt to be puzzled to know which was best adapted for his purpose. I should like to state my experience of some of these nostrums for the restoration of wanting fertility in the soil. Coles' Blood and Bone Manure is stimulating to the Grape Vine especially. I tried it last year upon Muscats, giving the early house three waterings with this manure. One house only was watered with it, so that I was able to note results. The berries of these Vines were one-third larger than those on Vines which had had none. The quantity used was 1 cwt. in all for the three waterings. Good results were noted from its application to Melons, Cucumbers, and Tomatoes. Another manure in the market is especially prepared for Potatoes, and it is a very valuable aid to

FIG. 190.—CYRTOPODIUM CURTISII. (SEE P. 552.)

LECTURES AND SHOWS AT THE DRILL HALL.—I am very glad to see your comment on the great inconvenience suffered by those who attend the lectures at the Royal Horticultural Society's shows—the inability to hear the lecturer or speaker. Spectators of the exhibits cannot be expected to view them in silence; half the pleasure and more than half the profit of the shows would be lost under such a restriction; their running comments resound through the Drill Hall, and drown the voices of the speakers at the table. Nothing to my mind proves the necessity of the Society having a hall of its own so much as the necessity of separating the lectures and shows—I mean, by having them in different rooms. This we shall not be able to effect till we are in a building of our own. I trust, therefore, that the scheme for the hall commented on by you in your editorial will be supported by all Fellows of

to let the sun in to colour the fruit, and that the more healthy leaves the Vine had the better would be the colour of the Grapes, which exactly agrees with M. Laurent's experiences. I never doubted the truth of Mr. Thompson's advice, and have always acted upon it. *C. W. S.*

MULCHING STRAWBERRIES.—One rather common product of employing clean straw for the top-dressing of Strawberry beds, is the after-growth of a quantity of corn left in the straw, through defective threshing. I saw last year a large breadth which had been so dressed, which became in the autumn very like a corn field. Of course the Strawberry plants should have been attended to, but it was beyond the possibilities of deficient labour to do so then. Straw generally of all kinds of corn is imperfectly threshed by machinery, and the unthreshed

this root. I have great faith in it, knowing it to be made from animal substances without admixture, and its value has become more than locally known during the last few years, and especially amongst market gardeners, Grape Vine growers, and others. *W. J. Cook, Compton Bassett.* [What is its name? Ed.]

CLOTHES MOTH.—In my house, naphthaline in its thin flaky crystalline form has been used with success for several years as a preventive. I prefer it to benzene, and not being a liquid it is less volatile. The substance is simply spread copiously amongst the folds of woollen materials in drawers or boxes, and the operation should be repeated at intervals during spring, summer, and autumn. The only drawback is the smell (to those who do not like it), which is rather tenacious, so that a blanket placed freshly on a bed in which a visitor is to sleep is apt to produce an impression that the room is "musty." And one's dress suit, if taken out of its hiding-place immediately before rushing up to town to attend a soirée or festive gathering, does not quite get rid of the odour on the journey. At one time or other I have tried most of the popular preservatives, such as camphor, insect powder, &c., and have found nothing so efficient as naphthaline. *R. McLachlan, Lewisham.*

RHODODENDRON QUEEN OF DWARFS.—This is an entirely new variety, raised and sent out by Messrs. Isaac Davies & Son, nurserymen, of Ormskirk, who have raised several varieties of hybrid Rhododendrons, which are admirably adapted for blooming early in the greenhouse. A plant reached me in the last week in March that had come by parcel-post, quite a small one, but having four shoots, each surmounted by a bold truss of pure white flowers. It is of dwarf habit, with small green leaves, and the flowers are well expanded. It can be grown in the open ground all the summer, lifted in October, placed in pots, and had in bloom at Christmas. I am not sure of its origin, but that it is a very useful hybrid early-flowering Rhododendron there can be no doubt. *R. D.*

ONIONS AT THE VEGETABLE CONFERENCE.—If any of your readers have studied the statistical report of the late Vegetable Conference at Chiswick, perhaps they can enlighten me on the following points, which I confess I do not understand. Taking the section Onions, on what principle were the typical varieties selected, and how can Anglo-Spanish be the type of the Plat, and Ailsa Craig that of the Globe Onions? Should not a "type" be a well-known standard sort? Why is Giant Rocca with its sub-varieties classed amongst the flat Tripolis? Did the Committee adopt a new type for these also? On what principles were Certificates granted? Were they given for improved varieties, or simply because the specimens shown were good? The awards seem comprehensible only on the latter supposition. I could ask many other questions, but fear to trespass too much on your space. *Enquire.*

A NOTABLE RHODODENDRON NUTTALLI.—At St. Rock's, Edinburgh, the residence of —Cowan, Esq., a remarkable specimen of this rarely seen species of Bhootan Rhododendron bloomed in an exceptionally successful way. The specimen was 6½ feet high, breaking into eight branches, each of which was terminated by a truss of flowers. There were fifty blooms in all in the eight trusses. Each bloom was about 6 inches in length, by about 5 inches across the trumpet-shaped limb of the corolla; the colour, white tinted yellow in the throat. There is at St. Rock's an excellent collection of plants in the houses which, along with the other gardening features of the place, reflect credit on the skill and intelligent management of Mr. Broadfoot, the gardener. *W. S.*

AUTUMN BEARING RASPBERRIES.—Shoots, or rather root-suckers, spring so numerously from old stools of this and other varieties of the Raspberry, that thinning out is very desirable. These suckers should be thinned out to about 6 inches apart, when they are a few inches high, retaining the strongest only, and tying them as they advance to rows of strained wires, or in some other simple fashion. These canes will bear a crop of fruit in the autumn. All future growth arising from the stools should be pulled up or cut off with the hoe. If required, the young plants, which are pulled up, may be transplanted in rows 4 feet apart and 12 inches from plant to plant; watered, and afterwards mulched with manure. *H. W. B.*

THE WILDSMITH MEMORIAL.—As the list of subscriptions now amounts to about the sum needed to put the selected child on the Gardeners' Orphan Fund, the Memorial fund is practically closed. It is but right that very hearty congratulations should be offered to all who have worked so cordially to secure the success of what is most certainly an unique memorial. When it is mentioned that, thanks to the kindness of editors of the horticultural papers and other good friends, the total expense incidental to the promotion of the memorial does not exceed a couple of pounds, it will be recognised that the work has been done most economically. To Mr. Turton, the Hon. Secretary, the warmest thanks of gardeners are due for the admirable results; whilst to Messrs. Arthur Sutton and Harry J. Veitch, the generous treasurers, all praise must be given for their kindly exertions. One admirable feature of the memorial has been the large sum obtained from persons not hitherto subscribers to the general Orphan Fund. It was found at the first that some persons concluded the proposed memorial would be of a permanent kind. That was not only out of the question, but was exceedingly undesirable. A memorial which will endure for ten years or so is sufficient. Death will come and orphans be made so long as humanity endures, and we can hardly find better methods of commemorating the virtues of the dead than by helping the unfortunate living. The Wildsmith memorial will prove to be an undoubted blessing to a poor orphan for eleven years, and I can hardly doubt but that many of our greater gardeners, were they asked as to what form of memorial they would prefer after death, would answer, "As those have done unto him, so do these unto me." Whilst this successful memorial removes as it were from election on the General Fund one prospective candidate, so through the great kindness of the employer of a recently deceased gardener, is yet a second prospective candidate removed from the contest also, and, therefore, the way is made more clear to those various candidates, of whom we have already heard through circulars and other methods of communicating with subscribers. I learn at the last moment that the following amounts have been collected and sent in: Mr. Hughes, Birmingham, £3; and Mr. Ams, Southampton, £1 5s. *A. Donn.*

SOCIETIES.

ROYAL HORTICULTURAL

Scientific Committee.

Present: Dr. M. T. Masters, in the chair; Mr. Morris, Rev. C. W. Dod, Mr. Godman, Mr. Michael, Dr. Müller, Mr. Pascoe, Dr. Seott, Mr. Wilson, and Rev. G. Henslow (Hon. Sec.).

Hybrid Narcissi.—Rev. G. H. Engleheart exhibited a collection of hybrids, amongst which was one called George Engleheart, a cross between *N. poeticus ornatus* and *Narcissus Tazetta*, Bazelman major. This was quite new, and received a botanical certificate. Another was between *N. poeticus* and a trumpet *Daifodil*, *Hudibras*; this had a remarkably large and flat crown. A third, between *N. poeticus ornatus* and *Mary Anderson*, had an orange-streaked cup, both parents having an orange-bordered cup; the colour had become intensified. Mr. Engleheart observed that the authors, being situated half-way between the points of the insertion of those of the two parents was a characteristic feature of hybrids amongst *Narcissi*, and that no appreciable difference occurs on the hybrids raised when the parentage is reversed. He also remarked that Dean Herbert thought that *N. Tazetta* var. *Bazelman major* was barren with its pollen, as he could raise no plants from it. This was probably due to a too chilly climate. Mr. Henslow remarked that *N. Tazetta* is very abundant amongst the rocks in Malta, and has two forms, one with a short stout stem, and many flowers, another with a long slender stem and fewer flowers.

Aristolochia Goldiana.—Mr. Morris commented upon the singular flower of this plant, which had blossomed at Kew (fig. 83, p. 521, April 25). There had been a race between the flower-bud and the shoot-bud. The former was small, and preceded out of the old wood. The flower-bud finally prevailed, and the shoot was thereby checked. It is a West African species, differing from the South

American in having twenty-four stamens, &c. It is figured and described in the *Botanical Magazine*, No. 5672.

Pearse, Variety.—Mr. Wilson exhibited a seedling from "Scott Wilson," of a deep blue-purple, with a red eye.

Plant Diseases.—Rev. C. Welley Dod gave an interesting account of several diseases of plants in his garden, and commented on the difficulty of finding curative means, or of hearing of other suggestions than burning. He first alluded to a species of smut (*Ustilago*) on *Primula farinosa*, which appeared to be indigenous, as the plants were collected in Lancashire; and although it was grown with *P. denticulata*, the smut was confined to the former species. *Leclitium ficaria* had attacked his *Hellebores*. In this case, a dryer soil was suggested as likely to prove effective in hiding the plants of the fungus. The "Lily spot," due to *Polyactis cana*, usually appearing late in summer, had been seen in April upon *Tulips*, and apparently the same species on *Daifodils*. It was suggested that a mixture of sulphate of copper and quicklime would prove effective, as in the case of *Vines*, described below. *Puccinia Striberi* had occurred on *Daifodils* from Portugal, and also upon the common double sorts.

Diseased Vines. treatment of, in France, with "Bouillie Bord-laise." Mr. Dod read the following communication:—"In the Médoc there are three applications of the treatment. (1.) The first is towards the end of May, when the *Vine* has produced shoots about 30 centimetres long. At this period the flower of the *Vine* is not yet opened. (2.) A second application is made at the end of June or the beginning of July. (3.) A third, about the first half of August. The first application requires about 2 hectolitres of Bouillie per hectare. The other two, 2½ to 3 hectolitres per hectare. With regard to the preparation of the Bouillie, the following is the method employed:—For a 100 kilos. In one tub is put 30 kilos. of water and 3 kilos. of sulphate of copper; in another tub 50 kilos. of water and 2 of lime. The sulphate of copper having been dissolved, and the lime well soaked, the two liquids are then mixed. Cold water is used and a slaked lime. Formerly small brooms made of Heather or Butcher's Broom were used to sprinkle the liquid on the *Vines*. Several varieties of syringe are now used. It was at first hoped that the Bouillie would destroy both the mildew and the Oidium. Up to the present time such has not been the case; and if the mildew is absolutely destroyed by this treatment, the use of sublimed sulphur has to be continued against the Oidium.

Sulphate of Iron as a Remedy against the Potato Disease.—Rev. G. Henslow quoted the following passage from a report by the late Professor G. Gilia, of Malta, upon the Orange disease; and bearing on the question of the destruction of vegetable parasites:—"Having watered two *Aralias*, three *Begonias*, an *Orange*, and several *Rose bushes*, with a solution of sulphate of iron, in the proportion of six grains to one litre; these plants, far from sustaining any injury, seemed to gain intensity of colour to their chlorophyll, and their buds shot with greater rapidity and luxuriance. Towards the end of the past year, *Potatoes* were attacked by *Phytophthora infestans*, to such an extent as to impoverish and destroy the crop of the greater number of fields, especially in the eastern districts of the island. In a small field adjacent to others infected by the fungus, the ground was sprinkled with the solution, prior to the sowing of the *Potatoes*; some young plants sprang up, and the crop was so abundant as to astonish the cultivators of the neighbouring fields, who were seized with a longing to adopt the method in question. Not a single leaf of these plants bore the fatal fungus. This was certainly due to the sulphate of iron which had destroyed the spores buried in the soil, and rendered the plants so vigorous as to impede the growth of the pernicious fungus."

Colours of Flowers, experiments on.—The following communication was received from Mr. Smeo:—"Some years ago, when experimenting with flowers and plants placed in a weak solution of silicate of soda, I noticed that the plants and flowers were affected by the solution according to their colour. The colours disappear in the following order:—blue, lilac, red, and brown, whilst yellow was the most persistent. Greens behaved according as blue or yellow predominated in its composition. The question has occurred to me whether the white varieties of flowers are not formed among plants in a similar order. We have an example in the blanching of the old flowers of *Fransceca*. Then

again in the poor varieties of *Vanla aculeata*, the petals are almost white with very pale blue veining. In *Cattleya*, the colour of the petals and lip disappear, leaving the yellow throat and the pale pink tint (which so often spoils a white *Cattleya* from a florist's point of view), as the remains of the red tint in the mauve colour. Therefore, as yellow is so persistent, we cannot expect a *C. citrina* to appear amongst our white varieties. The white 'crispum' is due to the disappearance of the brown blotches, leaving only the yellow markings on the column; and in the case of the yellow 'triumphans,' which is a poor form of the ordinary type, the brown blotches are either absent or in the process of disappearance. The only pure white forms of *Orchids* are *C. cristata alba* and *Dendrobium Kingium* album, var. *Heathii*.

Pleurose with *Polycichus Corolla*.—Mr. Douglas sent a plant with the corolla fibrous; the calyx was normal. It is a not uncommon form.

ROYAL AQUARIUM.

This show was held on Tuesday and Wednesday last, and was a very pretty display, much better and larger than on the former occasion. The success of the exhibition was, however, owing to the trade collections, amateurs being poorly represented. The leading group of plants was that of Messrs. J. Laing & Sons, Forest Hill, who showed a group containing some choice orchids and tuberous Begonias, and arranged in their usual elegant style; they also had the leading prize for a collection of fine *Civivas*. For a group from which *Orchids* were excluded, Mr. W. Morle, 283, R. Kent Street, W., was 1st, showing a bank chiefly of market flowering plants; and he also won other prizes, as for *Magnolia*, *Spiraea*, &c. Messrs. B. S. Williams & Son, Victoria Nurseries, Upper Holloway, contributed an extensive collection of plants similar to what was seen at the shows of last week. The *Rhododendron Williamsii*, which was included, is a very charming plant. *Rhododendrons* in pots came from Messrs. H. Lane & Son, Berkhamsted. Mr. C. Turner, South, had some tree Carnations, Mr. W. Gordon, Taikentham, a collection of tree *Ponies* tastefully set up with Japanese Maples, and Messrs. Chambers, Isleworth, a large bank of their white *Viola Snowflake*. Messrs. T. S. Ware, Tottenham, and Barr & Son, Covent Garden, were in competition for a collection of *Dalrids*, with which it was wisely stipulated should be shown with foliage, and were awarded prizes in the order named. *Aniculas* was a feature, and some good plants were shown. Messrs. J. Douglas, R. Dean, and W. Henwood were among the chief prize-takers. Mr. Douglas had the best collection of not less than fifty, and Mr. C. Turner followed closely. Messrs. Dean and Douglas also showed *Primroses* and *Polyanthus*, &c., in good examples. Messrs. Sutton & Son, Reading, had a collection of vigorous *Calceolarias* and some well-grown border *Auriculas*. The premier *Auricula* were Nellie Hubbard (coloured) from Mr. Douglas, a large flower of rich port colour and brilliant yellow centre; the show variety being Prince of Greens (Trail), from Mr. G. Wheelwright.

MANCHESTER ROYAL BOTANIC.

April 29.—The Society held its second show of the season in the Town Hall, in conjunction with the National Auricula Society. An Auricula show of itself is not very conspicuous in such a place as the Town Hall, but taken together with the various exhibits which Mr. Findlay has managed to pull together, it makes the whole interesting, and the details more than usually attractive to the lover of spring flowers. With the view of forming a setting to the general display of flowers, and other contrivances, there were sent up from the Botanical Gardens a mass of miscellaneous flowering and foliage plants, comprising *Palms*, such as *Kentia* and *Cocco*, some well-grown and finely coloured *Dracenas*, some *Pandanus*, and the robust *Grevillea*, which when in full specimen, such as with its arching pinnated leaves is not the least valuable plants for decorative work. In addition to these, we single the *Rubiaceous*, leathery-leaved *Kudgia macrophylla*, which was loaded with pyramidal umbels of flowers crowded together to form more of a pyramidal than a globose head as it is generally characterised. With its white stamens springing from the base of the petaloidal flower, it is beautiful to look upon, and possibly is one of the best inhabitants of the stove that could be recommended for general culture. Along with it were several good *Orchids*

of the villose lady-slipper kind, as well as a few *Cattleyas* and *Laelias*.

Nesting in front of some of those examples of greenery above described, was a really meritorious collection of the *Primula Sieboldii*, in varied colours. The cortusoides form of the *Primula* race is a captivating subject, and when one looks at the short peduncles and the crowd of umbels above, it seems almost as if the exhibitor was playing a freak, such as practised by some exhibitors of long-leaved *Hyacinths*, doubling them down to take the eye. There is nothing of this sort, however, and everyone was pleased with the Queen of Whites, the *alba magnifica*, the Chinese *Primrose*-looking Mrs. Goggin, Harry Leigh, Mrs. Byler, and others, varying in shade of colour from rosy-purple down to white, comprising most of the intermediate shades. These set a nesting among a group of *Pteris serrulata* in its crested form and Maiden-hair, and were confronted with a batch of *Bracconfield Primroses*, in variety of shades of yellow, set among the common moss, looked very charming indeed. A Silver Medal was awarded.

Mr. Sam Barlow sent a fine contribution of *Polyanthus* and *Primroses* in various colours, and in fine umbels.

R. S. Williams & Sons had a neat group of *Orchids*, containing one of the best *Odontoglossum luteo-purpureum* we have seen, some of those *Ladies-slippers*, which are in every collection now, the best of which was a variety of *caudatum*; and a rather interesting form of *Epidendrum*, called *inversum*. The yellow *Cattleya citrina* was beautiful, and the *Amaryllis* and *Civivas* were showy and good.

Barr & Sons, Covent Garden, had a lot of *Dalrids* put up among leaves, the best of which, outside of well-known and showy marketable sorts, were *Barbadoe's Oasian* and poetical *poetarum*, along with a very fine one, with a good saffron cup, named *conspicua*, and some *Tulips*, *Fritillarias*, *Triteles*, &c.

Mr. William Owen, Northwich, had a very choice lot of general things, particularly a *Cattleya Mendelii*, which had the most prominent lip we have seen, and in every respect one of the best of its class. Another good plant was *Dendrobium Wardianum*, with twenty-four blooms on one growth. His charming double examples of border *Polyanthus*, called *Queen Victoria*, called forth general encomiums; the truss is so large, and so double, and the gold edging is very pronounced.

Messrs. Dickson, Chester, put up a very striking collection of *Dalrids*. The pale yellow concolored *D. Hogg* is good, and the deeper yellow *maximus*, along with *Faistaff*, *Queen of England* and bicolor *grandis*, &c. Messrs. Dickson, Brown & Tait put up a nice contribution of cut *Narcissus* and superfluous *Tulips*, *Proserpine* and *Gesneriana* being striking sorts along with a lot of cut border flowers. Messrs. Dickson & Robinson had also a good lot of spring flowering bulbs, their *Tulips* being very clean and striking to the eye. An excellent form of *Dendrobium Wardianum* called *Bourdiani* variety, with about a 3 feet pseudobulb, the top half covered with flowers of more than ordinary richness, well merited the special certificate awarded. The proprietor is Mrs. Hodgkinson Bowden.

The *Auricula* classes were fairly well-filled, and the examples were of about an average character. In the class for six dissimilar varieties, Rev. F. Horner was 1st, with *Maranda*, *George Lightbody*, *Monarch*, Mrs. A. Pott, Richard Headley, and another. Mr. Lord, Tolmoorden, was 2nd; and Mrs. Benson, Ludlow, 3rd. For the best pair, Rev. Mr. Horner was again 1st, with Mrs. A. Pott, Rev. F. Horner, Marple, and *George Lightbody*; Mr. Irving Henn was 2nd, and Mr. Lord 3rd. The best pair came from Mr. E. Shipley; Mr. Middleton and Mr. Shaw following. The best flowers were A. Middleton and *Mayflower*. The best grey-edged flower was *George Lightbody*, from Mr. Lord; the best green-edged was *Attraction*, from Mr. Horner; and the best white-edged was *Aene*, from Mr. Shipley.

The alpine *Auriculas* are much more showy than the named show sorts. The "dusty miller"-like character and the dullish colour of the trusses in a town hall look a bit dingy at the best. The alpine sorts lift the eye a little above the common ruck in that way. Mr. J. Beswick, Mr. H. Enggie, Mr. Lord, and Rev. Mr. Horner had the chief prizes. There were others not much behind, such as Mr. Sam Barlow, but prizes after 3rd are not counted for much among horticulturalists generally. The 1st prize lot was grandly grown, as if in manner, judging by the foliage, and the trusses, and size of individual flowers. Three unnamed seedlings and a

sterling one called *Emir*, stood out conspicuous above their fellows. Other good ones were *Queen Victoria*, *John Bull*, *Sensation*, *Diadem*, *John Leach*, *Scarlet Gem*, and *Lord Lorne*. A very beautiful one named *Sir Trevor Lawrence*, but not fully developed, was shown by Mr. Barlow.

Polyanthuses in their several classes were poor—very poor indeed; most of them evidently had been wrenched out of the border and stuck in pots for show purposes. This will not do in the times we live. The best we noted were *Black Knight*, *Cox's Prince*, *Cheshire Favourite*, and *S. Butterworth*.

The double *Primroses*, particularly the crimson velvet double one almost lost to commerce, was fine in Mr. Barlow's stand, and so were the commoner double white and double lilac.

It now remains to notice an extraordinary collection of flowers sent by Mr. Joseph Broome from his garden at Llandudno, comprising thirty or more distinct kinds, all from the open ground, and including *Mignonette* in large trusses of spikes, *Roses*, *Paeonies*, *Centaurea montana*, *Primula cashmeriana*, *Marguerites*, *East Lothian Stock*, *Iris*, *Gentiana acaulis*, &c., all bespeaking to Manchester people the purity and salubrity of the atmosphere in which they were grown.

The day was good, the attendance fair, increasing as we left the hall to pen the above remarks.

ANCIENT SOCIETY OF YORK FLORISTS.

This body held its first show of the season on April 21, at the Guildhall, the public being, as usual, admitted free—a privilege of which a large number of people availed themselves. The arrangements were admirably made, and an excellent show was made. Over 500 specimens were staged by some twenty exhibitors. The display of *Hyacinths* was exceptionally fine, upwards of 200 pots competing. All the blooms were of good quality. There was a fair average collection of the show varieties of *Auriculas* and *Polyanthus*, good heads of *Tulips* in pots, and excellent specimens of *Polyanthus* and *Narcissus*. The new rules of the Society for restricting *Auriculas* and *Polyanthus* to pots not exceeding 1 inch in height, lent uniformity to the exhibition. The chief winner in the classes for *Auriculas* and *Polyanthus* was Miss Steward, who was closely pressed by others. Dr. Baker took all the 1st prizes for *Tulips*, and most of the premier honours for *Hyacinths*, including a prize given by Messrs. Clues Bros., of 23, Market Street, for six *Hyacinths*, dissimilar. Other exhibits consisted of Chinese *Primulas*, *Cyclamens*, *Cinerarias*, *Spiraeas*, stove and greenhouse plants. The next show will be held on May 28.

FLORISTS' FLOWERS.

CAULESCENT PHLOXES.

I shall not readily forget a display of these hardy flowers which I saw in the Rev. E. D. Horner's garden, Lowfields, last autumn, and whose agreeable fragrance floated over the whole extent of the same. One may well ask how such a fine display was obtained, for the plants do not always produce such fine heads of flowers on stems 1 and 5 feet high.

Mr. John Fraser used to produce such heads at Lea Bridge, many years ago, and may probably do so now. A plant so hardy and easily grown as the *Phlox* is apt to get neglected, and one form of neglect is to let the plant grow a long time in one place, and form a thicket of stems, quite exhausting the soil within range of the roots, and, as a consequence, the spikes increase in numbers, and the flowers decrease in quantity and in size in each umbel.

I have been tempted to make these few remarks because most persons would be delighted to own a collection of *Phloxes* in strength and vigour; moreover, the present is a suitable time to propagate by means of cuttings. The plants may be very easily raised from seeds, but the seeds should be sown on a mild hotbed in February, or at least not later than March 1. The young plants soon appear, and should be pricked out in boxes, and when established inured to the open air soon afterwards. These seed-

lings when planted in rich soil at about a foot apart will, in most cases, flower the first year. Cuttings may be taken now, these should be shoots from the old stools, and should be planted singly in small pots; plants so raised will flower by the end of the year. Or the cuttings may be planted in a border of fine sandy soil; they will root and produce plants strong enough to flower well next season, but not to flower much in the present one. The way to produce strong flowering plants, is to trust to cuttings, which are easily propagated, and the plants strike flower strongly the second year. The soil may be trenched and manured heavily. Avoid propagating the plants by division; this is an easy way of increasing the stock, but the best result can only be obtained by seeds or cuttings. The plants should be about 2 feet apart. *J. Douglas.*

THE WEATHER.

[By the term "accumulated temperature" is meant a figure representing the aggregate amount, as well as the duration, of the excess or defect of temperature above or below 42° Fahr. for the period named; and this combined result is explained in Day-degrees—i.e., "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.				RAINFALL.		BRIGHT SUN.	
	Always (or nearly) the Mean for the week ending April 26.	Above 42° for the Week.	Below 42° for the Week.	Above 42°, difference from Mean since Jan. 1, 1890.	Below Mean since Jan. 1, 1890.	More (or less) than Mean for (week) since Jan. 1, 1890.	No. of Bright Days since Jan. 1, 1890.	Total fall since Jan. 1, 1890.

12	1	52	0	17	2	7	72	10.2

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.
- Principal Grazing &c. Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending April 26, is furnished from the Meteorological Office:—

"The weather during this period has been very changeable and unsettled—at times bright and fine, at others dull, with somewhat heavy falls of rain and local showers of hail. Thunderstorms were experienced in many parts of England towards the close of the week.

"The temperature has just qualified the mean in the north and east of Scotland and the south of Ireland, but in all other parts of the kingdom it has continued rather low for the time of year, especially over the east of England. The highest of the maxima, which were recorded either on the 21st or 22nd, ranged from 67° in Ireland, S., and 63° in England, E., to 56° in Scotland, N., and Scotland, W., and 50° in the Channel Islands." The daily maxima during the latter part of the period were in many instances below 50°. The lowest of the minima were registered either on the 25th or 26th, and varied from 27° to 29° in Scotland, from 28° to 30° over Ireland, and from 30° to 35° over

England. In the 'Channel Islands' the thermometer did not fall below 41°.

"The rainfall has been a little less than the mean over the north of England, and about the normal amount in Ireland, as well as in England, E., but more in all other districts. Over southern and south-western England and in the 'Channel Islands' the fall has been heavy.

"Bright sunshine has been very little prevalent over southern England and the Channel; but in most other parts of the kingdom an increase is shown. The percentage of possible duration ranged from 45 in Ireland, S.; 42 in Ireland, N., and 41 in Scotland, E., to 24 in the 'Midland Counties,' 19 in the 'Channel Islands,' and 18 in England, S."

MARKETS.

COVENT GARDEN, May 1.

A STEADY business all the week, with supplies equal to demand. Another arrival of Tasmanian Apples to hand, but making lower prices. Household goods in fair supply. *James Webber, Wholesale Apple Market.*

ORCHID-BLOOM in variety.

SEEDS.

LONDON: April 30.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, write that very

little business was done on the seed market to-day. Red Clover seed steadily maintains the late advance, owing to the support derived from the American and Canadian markets. French Red Clover is also the turn dealer. Several purchases of Trefoil are being made, as the new crop is badly spoken of. Alsike and white remain as previously reported. Italian and perennial Rye-grasses are still wanted. Spriog Tares are now very scarce. Rapeseed is dearer. Mustard unchanged. Blue Peas in better demand. Canary firmer. Hemp seed fully as dear.

CORN.

Averages.—Official statement of the averages of the prices of British corn, imperial measure, for the week ending April 26:—Wheat, 30s. 4d.; Barley, 29s. 2d.; Oats, 18s. 6d. For the corresponding period last year:—Wheat, 29s. 7d.; Barley, 24s. 3d.; Oats, 17s. 8d.

FRUIT AND VEGETABLES.

SPITALFIELDS: April 30.—Plentiful supplies of green vegetables. Scarce supply of fruit—demand fair. Abundant supplies of Potatoes—demand very heavy. Prices:—English Apples, 1s. to 7s. 6d. per bushel; American Apples, 18s. to 26s. per barrel; forced Rhubarb, 1s. 3d. to 1s. 9d. per dozen bunches; natural ditto, 1s. 6d. to 2s. 6d. do.; Seakale, 1s. 3d. to 1s. 9d. per punnet; Cabbages, 2s. to 5s. 6d. per tally; Cauliflowers, 1s. 3d. to 2s. per dozen; Spinach, 1s. to 2s. per bushel; Sprouting Broccoli, 1s. 3d. to 1s. 9d. per sack; do., 1d. to 1s. 3d. per sieve; Greens, 2s. 6d. to 4s. per dozen bunches; Spring Onions, 2s. to 2s. 6d. do.; Carrots, 1s. 6d. to 2s. 6d. do.; Parsley, 1s. 3d. to 2s. do.; Mint, 2s. to 3s. do.; Horseradish, 1s. 3d. to 1s. 9d. per bundle; French Radishes, 2d. to 3d. per dozen bunches; Beet-roots, 4d. to 6d. per dozen; Endive, 1s. 3d. to 1s. 6d. do.; Cabbage Lettuce, 1s. to 1s. 6d. do.; Mustard and Cress, 1s. 3d. to 1s. 9d. per dozen baskets; Leeks, 2s. to 2s. 6d. per dozen; English Onions, 10s. per cwt.; Egyptian (Alexandria) Onions, 8s. to 9s. per cwt.; Carrots, 10s. to 20s. per ton.

STRAFORD: April 30.—Supply has been good during the past week, and a fair trade was done at the following prices: Cabbages, 3s. to 5s. per tally; Greens, 3s. to 5s. 6d.; loose, ditto, 2s. 6d. to 4s. per dozen bunches; Cauliflowers, 1s. 6d. to 2s. per dozen; do., 6s. to 10s. per tally; Turnips, 2s. to 3s. per dozen bunches; Carrots (household), 30s. to 40s. per ton; do. (cattle feeding), 15s. to 18s. do.; Parsnips, 3d. to 8d. per score; Mangolds, 12s. to 17s. per ton; Swedes, 6s. to 20s. do.; Onions, Egyptian, 8s. to 10s. per cwt.; Radishes, 4s. to 9d. per dozen bunches; spring Onions, 7s. to 8s. per dozen bunches; Rhubarb, 2s. to 2s. 6d. per dozen bunches.

POTATOES.

BOROUGH AND SPITALFIELDS: April 29.—Quotations:—Regents, 45s. to 90s.; Hebrons, 30s. to 80s.; Magnums, black, 35s. to 40s.; Bedfords, 40s. to 50s.; Lincolns, 40s. to 60s.; Yorks, 45s. to 80s.; Scotch, 60s. to 100s.; Imperators, 40s. to 70s. per ton.

SPITALFIELDS: April 30.—Quotations:—Magnums, 30s. to 50s.; Imperators, 30s. to 70s.; Hebrons, 30s. to 40s. per ton.

STRAFORD: April 30.—Quotations:—Scotch Regents, 55s. to 70s.; do. Magnums, 60s. to 80s.; English, light, Magnums, 45s. to 65s.; dark do., 32s. 6d. to 40s. per ton.

HAY.

Averages.—The following are the averages of the prices obtained at the various metropolitan markets during the past week:—Clover, prime, 75s. to 92s.; inferior do., 46s. to 75s.; hay, best, 69s. to 87s.; inferior do., 25s. to 50s.; and straw, 20s. to 38s. per load.

Obituary.

MR. STUART HENRY LOW, whose death we deeply regret to have to announce, was born January 4, 1825. He was one of four sons of Mr. Hugh Low, founder of the firm, who died in 1863. The eldest of the four still survives, viz., Sir Hugh Low, G.C.M.G., so well known for his travels and discoveries in Borneo, and in the Malay Archipelago

and Peninsula. In early life Mr. Stuart Low followed a seafaring career, having been mate of the trading ship *Groffhound*, but left the sea to join his father about the time of his brother James' death. He devoted himself with untiring energy to the business, which he increased to a very large extent. Travellers were sent to Mexico and California for coniferous seeds, in which a very large trade was done some thirty years ago, and many hundred thousands of young Pines, Firs, and Wellingtonias, were distributed from the nursery. A large quantity of Australian and Canadian plants were imported, and for many years formed an important feature. Since 1862 Orchids have taken a leading place, and travellers have been sent to South and Central America, Brazil, Mexico, Borneo, Java, the Philippines, Burmah, Madagascar, and other countries which Mr. Low, with his clear judgment, thought would be promising fields of research. Many of the leading varieties now in commerce are the result of his enterprise. In 1882, having to give up part of the land at Clapton, and finding great difficulty in successfully growing plants during the winter months on account of the nursery being so hemmed in with building, the freehold of over 40 acres was purchased at Bush Hill Park, Enfield, and a large part speedily covered with glass, the remainder of the land being devoted principally to fruit trees and Roses, which are grown largely.

Mr. Low was personally a most kind-hearted man, and won the affection of those he employed, a large number, having been with him for twenty-five to thirty-five years more. He was of singularly retiring disposition, not taking the public position a man of his zeal for horticulture might be expected to do; and had to be known to be appreciated. He was a most liberal supporter of many institutions for relief of want and distress. His wife died about twelve years ago, and the loss he then sustained told in a most marked manner upon him, the reverence he had for her memory being very great.

The business, we learn, will in future be carried on by the sons, Mr. Hugh Low, Mr. Stuart Henry Low, and Mr. Edward Valentine Low.

The funeral took place at Abney Park Cemetery on Saturday, April 26, and many of the leading nursery and seedsmen, and others connected with the trade, were there; the men from both nurseries, to the number of about 130, forming round the grave, which was covered with floral tributes from a large number of friends and acquaintances.

NOTICES TO CORRESPONDENTS.

*. Owing to the large extension of our circulation, we are under the necessity of going to press at an earlier time than heretofore, and request our regular correspondents to favour us with their communications as EARLY IN THE WEEK AS POSSIBLE.

AMERICA: *H. C.* America is a large place. In some parts it is covered with ice, in others the temperature is that of a forcing-house. Do you not think, before asking such questions as you do, that you should make yourself acquainted with the geography of the country? We might then be able to help you. As it is, you might as well ask if a young gardener would do well in the moon, and any answer we could give you would be about as useful.

ACRICIACUS: *A. F. Upstone.* The flowers sent are in no way unusual varieties. They are well grown, however.

CYMBIDIUM CAPDATUM: *F. Millward.* The flowers are very fine, and well coloured, the tails, respectively 27½ inches and 25½ inches in length, being well developed.

ERANTUM, p. 526.—In the abstract of Mr. Dod's paper on Daffodils, where the habitat of each section is defined, the figures No. 5 and No. 4 should be transposed. It is No. 4 "albus" which is so limited in its range.

ERUCIARIS: *Horbus.* In the absence of fuller particulars, we cannot say why your plants do not

There is no disease or mite present, so you had better look to their cultivation.

GRAPES: *E. S.* Your Grapes are badly rusted, and will always be disfigured. Rust may be caused by allowing draughts of cold air to reach the bunches whilst wet from syringing, and warm, and it may be induced by putting too much sulphur on the hot-water pipes or flue. The position in which your viney stands demands much care in the ventilation.

INSECTS ON VINE: *A. Y. Z.* The leaves are covered on the underside with very minute irregular black specks, apparently fungoid, produced, possibly, by the action of the manure-water used. They are also much blotched, as though spotted with water and acted on by sun or over-heating. The roots are almost destitute of rootlets, but do not show trace of Phylloxera. *I. O. W.*

NAMES OF PLANTS: *A. W. J.* Adonis vernalis; 2, Anemone pulsatilla.—*N. B.* Phlyca ericoides.—*P. R. D.* Babiana ringens, and *B. villosa*.—*A. W. Eria* obesa, Lindl.—*Crotop.* Dendrobium suavisimum.—*W. C.* We cannot undertake to name varieties of *Dafodils*.—*H. Horton.* Tropeolum polyphyllum.—*Nero.* 1, Kerria japonica; 2, Forsythia viridissima; 3, Gesnera elongata, probably; you should send flowers; 4, Rinthecka japonica variegata; 5, a Pittcairnia; we cannot say more from the scrap sent; 6, Poa trivialis variegata.—*J. A. L.* Franconia calycina; 2, Podocarpus neriifolia; 3, Bilbergia? specimen insufficient; 4, Sempervivum; 5, Agathea caulescens.—*A. W. D.* We take it to be a form of *Viola odorata*, on account of the lateral shoots.—*W. H. H.* Specimens insufficient for identification.

SPOTS ON TOMATO LEAVES: *J. H. N.* We cannot give the cause of the little discoloured places on leaf sent. They are mechanical; not caused by insects or fungi, so not likely to spread.

STRAWBERRY PLANTS KILLED: *T. J.* We still think it was the quality of artificial manure that was put into the potting soil. Rough and ready methods adopted by the gardeners favour accidents of this kind.

THOMSON'S VINE MANURE: *Taymouth.* We are unable to answer your question.

TOMATO LEAVES: *A. M.* There is no disease on these leaves as caused by insects or fungi. The appearances are brought about by some defect in culture.

TULIPS GOING BLIND: *T. W.* Cause is not ascertained. These and other bulbs are perhaps less liable in soils that become impervious to air if mulched with leaf-mould when planted.

VINES: *J. H. B.* Mildew. Try dusting with flowers of sulphur, or Sulphur vivum (black sulphur), over the leaves.

VINES: *Flying Dutch.* In the absence of full details of management, we should say that the Vines suffered from deficient ventilation, producing scalding of the leaves. The roots must be in bad condition for such miserable leaves as those sent to be produced.

WHILE SUSSEX FIGS: *A Constant Reader.* We cannot say which, without seeing fruits.

GREAT REDUCTION IN PRICE OF STANDEN'S ESTABLISHED NEARLY 30 YEARS. MANURE

The reduction has been effected through the introduction of increased and improved plant for manufacturing.

It is now generally acknowledged that this highly concentrated Manure exceeds all others in general fertilising properties and staying powers, thus rendering its money value at least double that of any other Manure.

It promotes a rapid, healthy, and robust growth to plants generally.

It is a clean and dry powder, with very little smell.

It is consequently particularly adaptable for Amateurs equally with Nurserymen.

Sold in Tins of increased sizes, 6d., 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each; and in Kegs (Free) at the following greatly reduced prices: 28 lb., 10s. 6d.; 56 lb., 18s.; 112 lb., 32s. each.

SOLE MANUFACTURERS: CORRY, SOLER, FOWLER & CO. (LIMITED), LONDON.

Sold by All Nurserymen, Seedsmen, and Florists.

GENUINE GARDEN REQUISITES, as supplied to the Royal Gardens. RUSSIA MATS—New Archangel, 9 ft. 4 ins. by 4 ft. 6 ins., 2s. 6d.; Heavy Petersburg, 7 ft. by 3 ft., 8 ins., 12s. 6d. SPECTALITE TOBACCO PAPER, 104 per lb., 28 lb. for 21s. TOBACCO CLOTH, 1s. per lb., 28 lb. for 28s. ORCHID PEAT, 5s. per sack. PEAT, LOAM, SAND, MANURES, and SUNDRIES. Price List free.—*W. HERBERT AND Co.*, Hop Exchange Warehouse, Southwark Street, London, S.E.

SAVES MORE THAN TWICE ITS COST IN LABOUR. NO SMELL.

One application will keep the Walks and Drives clear of Weeds for at least 12 months.

Highly recommended by the Judges of the Alexandra Palace Show, 1889, after 15 Months' Trial. Awarded a Certificate of Merit by the South-Side Horticultural Association, 1890. Mr. W. G. HEAR, Crystal Palace, says:—"We were so satisfied with your composition and its price, that we have used it absolutely, and have every confidence in recommending it."

Mr. R. THOMAS LYONS, Curator, Botanic Gardens, Cambridge, says:—"There can be no question with regard to its efficacy." Prices:—In 1 and 2 gal. tins, 2s. per gal. (tin included); in 5 gal. drums, 18. 6d. per gal.; 10 and 15 gal. Drums, 18. 4d. per gal. Special quotation for large quantities. Carriage paid on 10 gals. and upwards.

1/2 Used in the proportion of One Gallon to 25 Gallons of Water. TO BE HAD OF ALL NURSERYMEN AND SEEDSMEN.

To prevent disappointment, insist upon having the "ACME" Sole Proprietors and Manufacturers.

THE AGRICULTURAL CHEMICAL COMPANY, Tunbridge, Kent; & Carlton St., Bolton, Lancashire. Agents in Ireland—*W. DILLMUND & SONS*, 58, Dawson St., Dublin; *WALKER & CARON & SONS*, 21, Bechoiler's Walk, Dublin; *A. L. YELLOW FIBROUS LOAM, PEAT-MOULD, and LEAF-MOULD, 11s. per bushel.
SPHAGNUM MOSS, 8s. 6d. per sack.
MANURES, GARDEN STICKS, VIRGIN CORK, TOBACCO CLOTH, RUSSIA MATS, &c. Write for Price List—H. G. SMYTH, F.R.H.S., 21, Goswami's Street, Drury Lane, (nearly opp. 175, Gray Yard), W.C.

NATIVE GUANO: Best and Cheapest Manure for Garden use. NATIVE GUANO. Price £1 per ton, in bags. Lots under 30 cwt., 4s. per cwt. 1 cwt. sample bag sent, carriage paid, to any station in England on receipt of P.O. for 5s.

Extracts from Thirtieth Annual Collection of Reports:—"NATIVE GUANO for POTATOS, VEGETABLES, FRUIT, &c.—C. FIDLER, Reading, used it for Potatos, and says—"I found your Manure gave very satisfactory results."

C. J. WAITE, Gr. to Col. the Hon. W. P. Talbot, says—"I can strongly recommend your Native Guano as a first-rate Manure for any fruits or in the garden crops, also grass. In the 5 years during which I have freely used it, I have gained over 500 prizes."

NATIVE GUANO for ROSES, TOMATOS, &c.—W. G. FAIRLEY, Nurseries, Bexley, used it for Roses, Tomatoes, and Cucumbers, and says—"I used it a good and cheap article."

A. F. BARROW, Royal Horticultural Society, says—"Without doubt a very valuable Manure, and easy of application."

Orders to the NATIVE GUANO Co., Limited, 21, New Bridge Street, Blackfriars, London, E.C. where Pamphlets of Testimonials, &c. may be obtained. A sample sent.

THE "PERFECT" SUMMER SHADING

Supersedes all Others WITHOUT WHICH NONE IS COMPLETE. For SHADING GLASS ROOFS of ALL KINDS. Is the Cheapest. Goes four times as far as the old preparations. Note its merits described below.

Messrs. CARLTON, Contractors for the painting of the Glasgow Exhibition of 1888, write:—

"By order of the Directors we applied this Shading to the glass roofing of the Glasgow Exhibition, and found it possessed great advantages over all other preparations we had met with. Being applied cold it was most convenient to use, and while it resisted the action of the rain the whole was on it was at once easily removed by gentle rubbing after wetting. It afforded a cool and pleasant shade, at the same time admitting an abundance of light."

Price.—1 lb. tin, 1s.; 2 lb. tin, 2s. Post-free, 4d. extra. 1 lb. makes half a gallon for use.

TO F. "PERFECT" WEED KILLER

Maintains its Superiority over all Rivals for permanently destroying vegetation on Walks, Parades, Drives, &c. Tennis Courts, Stone-work grown green, &c. Used at Kew Gardens, Royal Horticultural Gardens, &c. &c.

BEESON'S MANURE.—The Best and Cheapest Fertiliser for all purposes. Write for Circular containing the Leading Gardeners' and Market Growers' Reports. Sold in Tins—1s., 2s. 6d., 5s. 6d., and 6s. 6d. each, or cwt. Bags, sent, 13s. By all Seedsmen, or apply direct to W. H. BEESON, Carbrook Bone Mills, Sheffield.

TO MARKET GARDENERS, &c.—To Grow Fine VEGETABLES and FLOWERS, Gardeners should use SUPERPHATE OF AMMONIA. One trial will prove the great value of this Manure, and ensure its constant use hereafter. It can be applied either separately or mixed with ordinary Stable or Farm-yard Manure. Rose Trees and Garden Plants are much benefited by being watered with a weak solution once or twice a week. Instructions on application, post-free. Price free on rail at Sheffield, 3s. per cwt. sack; 5 for 15 lb. P.O. orders payable to the Manager, Sheffield Gas Company, Sheffield.

"ROSIKA"

Trade Mark Registered. Effortless, Harmless. Prompts clear Roses and all plants from green fly, caterpillars, spiders, and other insect pests. It recommends itself to all who have tried it for its efficiency, pleasant odour, the facility with which it is applied, and its closeness in application; so that anyone, however performing, can use it, and it is always ready for use. Price 1s. Sold at all Chemists and Seedsmen, or direct from the manufacturers, F. SCHUTZE & CO., 35A, Aldersgate Street, London, E.C. Apparatus for use of Rosika, 3 sizes, 1s. 6d., 3s., and 4s. 6d.

GISHURST COMPOUND, used by leading Gardeners since 1859 against Red Spider, Mildew, Thrips, Green Fly, and other Blight. 1 to 2 ounces to the gallon of soft water; 4 to 16 ounces water dressing for Vines and Orchard-house Trees; and in lather from the cake against American Blight. Has outwitted many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d.

GISHURSTINE keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s., from the Trade, Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

NOTICE TO ADVERTISERS.—In many instances Advertisers, in Payment of Insert Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish recalled.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable to No. 42, DORNEY LANE, to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable to a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it. N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

WE HAVE ESTABLISHED a Complete Bureau of Registry and Information for firms wishing experienced and reliable GARDENERS, FARMERS, SUPERINTENDENTS, COACHMEN, and similar assistants.—Call at or apply to—JOSEPH BEER and SONS, 51, 52, and 53, North Market Street, Boston, Mass., U.S.A.

HOLLOWAYS' PILLS.—Pure Blood.—When the Blood is pure, its circulation calm and equable, and the nerves well-strung, we are well. These Pills possess a marvellous power in securing these essentials of health by purifying, regulating, and strengthening the fluids and solids. Holloway's Pills can be confidently recommended to all persons suffering from disordered digestion, or worried by nervous fancies, or neuralgic pains. They correct acidity and heart-burn, dispel skin blemishes, quicken the action of the liver, and act as alternatives and gentle aperients. The weak and delicate may take them without harm. Holloway's Pills are eminently serviceable to invalids of irritable constitution, as they raise the action of every organ to its natural standard, and universally exercise a calming and sedative influence.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1890.

The Winners of every Highest Prize in all cases of competition, and they are the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by—
HER MOST GRACIOUS MAJESTY THE QUEEN on many occasions,
HIS ROYAL HIGHNESS THE PRINCE OF WALES,
THE KING OF THE BELGIANS,
The Late EMPEROR OF THE FRENCH, THE EMPEROR OF RUSSIA,
And most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "Journal of Horticulture," of June 9, says:—"MOWING MACHINES.—After a critical examination the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 155,000 of these Machines have been Sold since they were first introduced in the year 1856.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.
The following are their Advantages over all others:—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

SPECIAL.—A FEW TESTIMONIALS OUT OF THOUSANDS RECEIVED.

ROYAL GARDENS, WINDSOR, January 28, 1890.

To Messrs. GREEN & SON, Limited,
Dear Sirs,—In sending you the enclosed order for Lawn Mowers, I think it may be interesting to you to know that I am still using the Horse Machine you supplied in the year 1866; it is in perfect order even now, which is a proof that the workmanship is first-class, and speaks for itself. As to your "Hand Silens Messor," no Lawn Mowers could give greater satisfaction either to myself or to the men who work them—they are unequalled. During the season I have them daily in use in the Royal Gardens here, and never have the slightest trouble with them. Your machines are also the only ones I have in use at the Private Gardens, Hampton Court Palace; the Royal Lodge, Windsor Great Park; Cumberland Lodge, and the Royal Pavilion Grounds, Aldershot. I shall feel a great pleasure in recommending them to all my friends.
I remain, dear sir, yours very truly,
THOMAS JONES.

Wellingtonborough, February 4, 1890.
To Messrs. Green & Son, Leeds.
Gentlemen,—I have sent you our Lawn Mower for repairs, which please have done to it. I have used your machines for 25 years, and I find them more durable and do their work better than any other machines I have tried.
I am, gentlemen, yours truly,
DAVID FERGUSON,
(Gardener to W. Blott, Esq.),
Cottingham, Hull, February 13, 1890.

Mr. J. R. STIRLING, of the ROYAL GARDENS, BUCKINGHAM PALACE, writing under date Feb. 24, 1890, says:—
As regards the work your 12-inch Horse Machine does which two years ago took the place of the one you supplied in '63, I may say it is kept in constant use here from February until the end of the mowing season, and continues to give the greatest satisfaction. It is the best Machine I know for good work and durability, and your "Hand Silens Messors" also excel all others. We have no other Lawn Mowers in use here, and I always recommend them to all my friends who inquire about Lawn Mowers.

JOHN HAYNTON,
Ivy Bank, Broadway, Worcester, April 13, 1884.
Gentlemen,—Some fifteen or sixteen years ago, I had from you one of your 12-inch Lawn Mowers which, I may say, has been left in cutting the overhanging grass on the edges of walks, borders, flower-beds, &c., and do away with the tedious operation of cutting with shears.
I am, yours faithfully,
C. FRENCH HARTLEY.
Messrs. Green & Son, Leeds.

Bathurstien, Ashford, Kent, June 14, 1878.
Gentlemen.—Your "Silens Messor" Mower, 20-inch, works splendidly. It is a most perfect machine, and beats the old 20-inch one that for so many years did my work without repairs. I recommend your machines, and never see any doing such good work and with so little power. You may refer any one to me, and I will then show them the S.M. at work, and I shall show it to all I can.
I am, yours truly,
W. H. MOULD.
Messrs. Green & Son.

Kinlorthy, Hungerford, April 20, 1883.
Sirs,—I shall be glad to list of your Lawn Mowing Machines priced. I am glad to mention that I bought one of your 14-inch machines 22 years ago. It has had hard and rough usage every year since, and only on 30 days was it put quite out of use by the snapping in two of the driving wheel under the hammer. It is surprising to think of the work it has done, and done well.
Yours faithfully,
ALFRED T. BAZETT.
Messrs. Green, Leeds.

GREEN'S PATENT "MULTUM IN PARVO" LAWN MOWER.

GREEN'S Patent LAWN TENNIS COURT MARKER.

GREEN'S PATENT GRASS EDGE CLIPPER

Delivered Carriage Free at all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland.
The largest stock of Mowers kept by any manufacturer is to be found at our London Establishment, SURREY WORKS, BLACKFRIARS ROAD, where Purchasers can make selection out of several hundred Machines of Hand, Pony, and Horse Power, and have their Orders supplied the same day as they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, Free of Cost to the Purchaser.
N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London Establishment, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

"PERFECT" SUMMER SHADING

Supersedes all Others WITHOUT WHICH NONE IS GENUINE.

For SHADING GLASS ROOFS OF ALL KINDS. Is the Cheapest. Goes four times as far as the old preparations. Note its merits described below.

Messrs. CARLTON, Contractors for the painting of the Glasgow Exhibition of 1888, write:—

"By order of the Directors we applied this Shading to the glass roofing of the Glasgow Exhibition, and found it possessed great advantages over all other preparations we had met with. Being applied cold it was most convenient to use, and while it resisted the action of the rain the whole season it was at once easily removed by gentle rubbing after wetting. It afforded a cool and pleasant shade, at the same time admitting an abundance of light."

Price:—1 lb. tin, 1s.; 2 lb. tin, 2s. Post-free, 4s. extra. 1 lb. makes half a gallon for use.

Nicotine Soap.

AN Unrivalled INSECTICIDE for
the use of Plant Cultivators, being an
effectual ERADICATOR OF SCALE, THIRPS,
GREEN FLY, MEALY BUG, and ALL
PARASITES affecting PLANTS, WITHOUT
INJURY TO FOLIAGE. It has now under-
gone a thorough test by some of the most practical
men in Horticulture, and it is proved,
beyond all doubt, that no Insecticide will bear
comparison with it for its deadly effect on Insects,
combined with perfect safety to the Plants
themselves.

*Some hundreds of Testimonials lately received
from men of considerable experience throughout
the Kingdom.*

**MY NEW DAHLIA
CATALOGUE**

Has been posted to my Patrons; anyone not receiving
same should apply at once, when a further Copy shall be sent.
It contains—

MY NOVELTIES FOR 1890,

which are quite equal to my previous introductions, many of
which are among the most popular of the day. Each section
is fully represented, and every good variety will be found fully
described. I have a grand collection of—

**CACTUS, SINGLE, POMPONE,
SHOW, FANCY, and STELLATE
VARIETIES.**

All are good strong plants, established in pots, and will be
ready for planting the 1st week in May. This Catalogue also
contains a fine collection of the—

**NEW LARGE-FLOWERING
CANNAS,**

Having flowers almost as large as Gladiolus, of almost every
shade of colour. This Catalogue also contains an abridged list
of Chrysanthemums, Marguerites, Peat-stemmed, Single Py-
rethums, and many other popular groups for present planting.

I have issued this season the following Descriptive
CATALOGUES:—Illustrated Early Termination, Florist
Flowers, Tree and Herbaceous Peony, Japanese and Alpine
Ferns, Climbing Plants, Hardy Ferns, Chrysanthemums,
Choice Flower Seeds. Any of which can still be had upon
application to

ORCHID EXHIBITION.

One of the most beautiful sights in London.

ORCHIDS.—The Orchid Exhibition at Mr. WILLIAM BULL'S Establishment for New and Rare Plants, 536, King's Road, Chelsea, London, S.W., now OPEN, 10 to 6 o'clock. Admission, 2s. 6d.

ORCHIDS.—A vision of loveliness unparalleled in Europe.

ORCHIDS.—"A scene of the greatest Orchidic beauty, basking description, and defying exaggeration."

ORCHIDS.—The Exhibition is worth going any distance to see at Mr. WILLIAM BULL'S Establishment for New and Rare Plants, 536, King's Road, Chelsea, London, S.W.

WILLIAM BULL, F.L.S., Establishment for New and Rare Plants, 536, KING'S ROAD, CHELSEA, S.W.

CLIBRAN'S SUPERIOR DAHLIAS. Superb Shows, Charming Fancies, Best-Bodied, Pretty Bouquet, Exquisite Singles, Lovely Cactus, novel and distinct, special sorts, 12 vars., 2s. 6d.; 50 in 12 vars., 12s. 6d.; 100 in 50 vars., 21s. See List, free.
CLIBRAN, Oldfield Nurseries, Atricham and Manchester.

CYPRIPEDIUM MACRANTHUM AND CUTTATUM.

These beautiful blooming Siberian Orchids can bear the coldest winter without being covered, and are the most splendid and interesting open air plants for Flower Gardens and Parks.

Sent direct from Siberia, in fresh and strong plants, in blooming condition.
Price at St. Petersburg (Russia), £2 10s. per 100; £20 per 1000.

Orders received by W. WIENE, Gartnerei Staraja Derewnja, 9, St. Petersburg.

CLIBRAN'S CHRYSANTHEMUMS. Our stock is now recognised as perhaps the largest and most complete Collection in the Kingdom—superior varieties rigorously selected out year after year. 12 Japanese, named, 5s.; Pompanos, Anemone-flowered, &c., same price. See List, free.
CLIBRAN, Oldfield Nurseries, Atricham and Manchester.

NOW (and when the plants have commenced to grow) is an excellent time to plant **HOLLIES**, **CONIFERS**, **YEW**s, and almost all **EVER-GREEN SHRUBS**, also **ASPARAGUS** (strong 1-yr. roots, 2s. 6d. per 100).

CLEMATIS may be planted in May.
DESCRIPTIVE LISTS of the above and following free.
CREEPERS for Walls.
ROSES in Pots, best new and Old English and Foreign Sorts.

RICHARD SMITH & CO., NURSERYMEN and SEED MERCHANTS, WORCESTER.

DANIELS BROS., TOWN CLOSE NURSERIES, NORWICH.

BEG to offer the following, in strong, healthy, young plants, from their splendid Collection of Choice Named FLORISTS' FLOWERS, &c., all guaranteed true to name, and sent Carriage Free at prices quoted:—

Abutilons. —Choice varieties to name, 6 for 2s. 6d.	4 6
Bouvardias. —A very choice assortment, including all the most beautiful	6 for 2s. 6d. 4 6
Coleus. —In charming variety	6 for 2s. 6d. 4 6
Chrysanthemums. —Strong rooted cuttings from our fine collection of Japanese and Incurved varieties, to name	per 100, 15s. 2 6
.. Extra choice sorts, to name	per 25, 3s. 6d. 3 6
.. Six superb new Japanese, including Mrs. Alpheus Hardy, 7s. 6d.	
Cyclamen persicum giganteum. —Strong mixed seedlings, per 100, 17s. 6d.	2 6
Dahlias, Show and Fancy. —A grand collection, including all the choicest sorts, 6 for 2s. 6d.	1 6
.. Cactus-flowered. —A splendid assortment, including all the most beautiful	6 for 2s. 6d. 1 6
.. Inaren, the true Cactus, brilliant scarlet, fine	each, 8d. 7 6
.. Constance, pure white	each, 8d. 7 6
.. Empress of India, dark maroon crimson, magnificent	each, 9d. 8 0
.. 4 superb new varieties of 1890, 1 of each, 1s. 6	
.. Single-flowered. All the newest and most beautiful sorts, our selection	6 for 2s. 6d. 1 6
.. Pompon. —A splendid collection	6 for 2s. 6d. 3 6
Fuchsias. —Single and Double-flowered. All the most beautiful sorts. Strong young plants from single pots, to name	6 for 2s. 6d. 3 6
.. Extra choice sorts, to name	6 for 2s. 6d. 3 6
.. Four superb new varieties, including Countess of Aberdeen, 5s. 6d.	
Musk. —Harrison's Giant, fine	each, 1d. 3 6
Marguerites. or Parisian Daisies. In variety, per doz., 6 for 2s. 6d.	3 6
.. Cloth of Gold, very large, beautiful golden-yellow flowers	each, 9d.; 3 for 2s. 6d. 7 6
Pelargoniums. All outdoor-growing, well rooted young plants from single pots	
.. Single-flowered Zonal, from our magnificent collection, including the newest and most beautiful sorts, to name	6 for 2s. 6d. 1 6
.. Extra choice and new varieties, to name	6 for 2s. 6d. 3 6
.. Six superb new varieties of 1890 (Pearson's sort), 7s. 6d.	
Double-flowered Zonal. A splendid class of highly improved varieties. Fine named sorts, one white from single pots	6 for 2s. 6d. 1 6
.. Extra choice varieties	6 for 2s. 6d. 6 0
.. Six superb new varieties of 1890, 7s. 6d.	
Double-flowered Ivy-leaved. A magnificent class. Spotted for pots, hanging baskets, vases, &c. for bedding out. Fine varieties to name, very cheap	6 for 2s. 6d. 1 6
.. Extra choice sorts, to name	6 for 2s. 6d. 6 0
.. Three fine new varieties of 1890, 1s. 6d.	
Pentstemons. —A beautiful selection, in strong, sturdy plants	6 for 2s. 6d. 3 6
Phloxes, Herbaceous. All the most charming varieties. Established plants	6 for 2s. 6d. 1 6
Petunias, Double fringed.—In beautiful variety. Splendid for pots	6 for 3s. 6d. 6 0
Begonias, Tuberosus-rooted, Single. Immense flowers, and in the most beautiful variety. Strong flowering dormant tubers. Splendid for pots	per 100, 49s. 6 0
.. Double-flowered, splendid varieties	per 30 6 0

CLIBRAN'S LOVELY TEA ROSES, best sorts in pots, 1s. per dozen; stronger for forcing, 2s. 6d. and 3s. 6d. each. For new and beautiful sorts, see List, free.

THE INTERNATIONAL EXHIBITION, EDINBURGH, 1890.

THE great success of the International Exhibition held in Edinburgh in 1880, led many to think that another of much larger proportions might be undertaken with every assurance of success in the present year. The project met with abundant encouragement, not only at home, but from all parts of the world there came assurances of support. The general result is, that the Exhibition which was opened on the 1st inst. by their Royal Highnesses the Duke and Duchess of Edinburgh, is the largest and most varied and complete exposition of up-to-date achievements in the arts and sciences ever brought together in Scotland.

The electrical appliances, which form a central source of interest, are admitted to be the fullest and most perfect show of the kind that has yet been seen in Britain. These, along with other machinery, occupy a noble hall, which covers an area of about 3 acres, being 800 feet long, by 150 feet wide. The main building, in which are located the multitudinous British and foreign exhibits of industry and art, the picture galleries, &c., stands on an area of between 6 and 7 acres. On the opening day the whole exhibition was in as complete and orderly a condition as could be expected in such a large undertaking, involving such an infinitude of detail and mixed personal interest a circumstance that reflected most favourably on the energy and tact of the executive and staff, under the able direction of Mr. S. Lee Bapty, the general manager.

THE GROUNDS.
Are about 70 acres in extent, and beautifully situated at Merchiston, about 2½ miles south-westward from the centre of the city. At all points charming views of the Braids and Craiglockhart hills, lying a little to the south and west, are obtained, and the lovely wooded Corstorphine hill is equally pleasing and conspicuous as a boundary to the view on the north. With such an admirable site and ample extent of surface, the exercise of taste and skill could hardly fail to produce beautiful gardening features.

These were all fully developed and completed on the opening day. The gardening committee, of which Mr. John Methven, of the firm of Messrs. Thos. Methven & Sons, is convener, and all gentlemen connected with horticulture, and they have been fortunate in securing the services as landscape gardener of Mr. James Brown, whose training under his father, Mr. Brown, gardener at Gosford, East Lothian, has eminently qualified him to carry out such work with taste and skill.

On November 1 last, operations were commenced in what was then chiefly arable farm land. Now the whole space unoccupied by the exhibition buildings, and various other erections scattered about the grounds for the amusement and recreation of visitors, is a charming garden with much variety of feature both in design and furnishing. The portion of the grounds lying to the south of the exhibition buildings, the latter extends from east to west, cutting the grounds in nearly two equal parts, is laid out in an extensive promenade flanked on either side with undulated bold masses of shrubs and trees, lawns and parterres. The shrubs and trees chiefly employed are Rhododendrons, Hollies, Aucubas, Berberis, Cupressus, Austrian Pine—the latter splendid specimens, as indeed are all other of the larger subjects. Very few deciduous trees have been made use of, they being less useful in producing immediate effects than evergreens. The land lying to the north of the buildings has been laid out as a recreation ground, for sports, &c., and here also will the show of the Edinburgh Agricultural Society be held in the course of the summer. Among the amusements provided in another part of the grounds is a maze on the plan of that at Hampton Court.

NURSERYMEN'S EXHIBITS.

By the royal entrance at the east end of main buildings, Messrs. Thos. Methven & Sons, Edinburgh, made a noble display of specimen and half specimen Hollies, standards and pyramids, rich in variety. The same firm also has a fine collection of choice Conifers, tastefully arranged in the parterre on one side of the grand promenade at the west end of the main building. In the collection were notable specimens of *Seiadopyx verticillata*, 7 feet high; *Abies concolor* violacea, 6 feet; *Thia elegantissima*, 6 feet; *Cupressus Lawsoniana lutea*, 6 feet, &c.

On the opposite side of the grand promenade at this point, Messrs. Ireland & Thomson have a similar parterre filled with a more miscellaneous assortment of ornamental trees and shrubs. The arrangement is well adapted to the design, and the variety introduced is considerable. Large starlike beds, which form the centre of the design on either side of an intersecting walk which divides the parterre in two, are massed in sections with Golden Queen, Hodgkin's, and Moonlight Hollies, relieved by golden and green *Retinosporas*, and have a very pleasing effect. Other of the larger beds were filled with miscellaneous and ornamental evergreens, relieved by standard Weeping Willows and *Spiraea arifolia aurea*, with its bright golden leaves just unfolding, is pretty freely used to impart brightness to the whole.

On the left of the bridge near the band-stand, Messrs. James Dickson & Sons, Edinburgh, have a very fine group of choice Conifers and miscellaneous evergreens, interspersed with choice deciduous ornamental trees and shrubs. The arrangement is light and elegant, and I may have to notice some of the deciduous components of the group later in the season.

Near by this, Messrs. Ireland & Thomson have

an excellent corner group of specimen Hollies, interspersed with ornamental deciduous trees.

In the same neighbourhood, Messrs. Dickson & Co. have an extensive display of young and specimen ornamental stock, planted in various styles in several large beds. In one large bed, bold, well-furnished specimens of Hodgkin's Holly occupy the centre, and form a fine foil and background to broad triangular masses of well-coloured Aucubas, *Euonymus*, Golden Box, *Retinosporas*, and other dwarf coloured Conifers, planted on the margins. Numerous standard, weeping, and erect ornamental deciduous trees are employed to give grace and variety to the outlines and circular beds of *Violas* in the foreground of the several groups, and lend a pleasing touch of colour to the whole.

On the northern side of the grand promenade, by the bridge which spans the Suburban Railway, is the groundwork of an exhibit of ornamental trees and shrubs by Messrs. R. B. Laird & Sons, which was unfinished when my note taking, so far, came to an end, and I may have occasion to advert to it again.

In closing my notes for the present, it may be of interest to readers who contemplate visiting Edinburgh during the season to know something of the facilities of access to the exhibition from the city. The Caledonian and the North British Railways each have stations within the Exhibition grounds, and visitors may look at either of the city or suburban stations at the fare of 1s., including admission to exhibition. The tramway cars run from all the central and eastern parts of the city to the grand entrance every few minutes, and offer the same facilities as the railway companies for cheap conveyance and admission. *W. S.*

(To be continued.)

NEW OR NOTEWORTHY PLANTS.

PTERIS ENSIFORMIS, *Burm.*, VAR. VICTORIE, *Hort. Bull.**

This is a beautiful new variegated *Pteris*, recently imported by Mr. William Bull from the Eastern Archipelago. *P. ensiformis* of Burmann, better known as *P. crenata* of Swartz, is spread from the Himalayas southward to Ceylon, and eastward to North Australia, Samoa, and Fiji. It belongs to the less compound type of the genus, with free veins, and is allied to *P. cretica* and *serulata*, differing from the former in the barren and fertile fronds being more dissimilar, and two or three of the pairs of pinnae, not the lowest pair only, being compound at the base.

Mr. Bull has had prepared for his catalogue a coloured figure of the plant, which no doubt will be highly appreciated by Fern cultivators, and form one of the principal attractions of the exhibition and conference at Chiswick in July. *J. G. Baker.*

CALANTHE (§ *PREPTANTHE*) *RUBENS*, *Ridley, n. sp.*[†]
Among several remarkable novelties discovered by Mr. Curtis in the Langkawi Islands, lying off the

* Rootstock decumbent, subterranean. Fronds dimorphic, many to a tuft, the fertile ones in the centre on longer, more erect stems, both kinds pinnate, with a long linear ensiform, and three or four distant pairs of sessile pinnae, all of which, or all but the uppermost pair are forked at the base. Fertile fronds with entire segments $\frac{1}{2}$ inch broad, margined by the narrow sorus, the end one reaching a length of half a foot or more, the side ones shorter, all beautifully variegated throughout with close lanceolate white teeth extending from the midrib nearly to the edge, and furnishing a striking contrast to the normal dark green colour of the ground-work. Sterile fronds with broader, shorter segments, and less decidedly variegated, about $\frac{1}{2}$ inch broad, and minutely incised-crenate.

[†] *Calanthe* (§ *Preptanthe*) *rubens*, *Ridley, n. sp.*—Pseudobulbs segmental conical, deeply grooved, 6 inches long, and $\frac{1}{2}$ inch through at the base; silvery coloured. Leaves not yet

west coast of the Malay Peninsula, is a small but charming *Calanthe* of the *Vestita* section, which appears to be quite undescribed, probably having been mistaken previously for *Limatodes rosea*. It flowers readily and well, the flowers being numerous, pretty, and lasting a long time. Plants have already been sent to England. *H. N. Ridley, Botanic Garden, Singapore.*

PLANT NOTES.

ACALYPHAS.

The members of this genus are inmates of the stove, some of them having very beautiful and rich-coloured foliage, and therefore useful for decorative purposes. The species are of easy culture and propagation, and the latter operation may be carried on successfully at any time of the year, provided the cuttings be placed on a mild bottom-heat, rooting taking place in about ten days. I think the leaves will produce roots, but not buds. Very luxuriant foliage may be obtained by propagating some plants from time to time, and growing them on without stopping the point of the stem until it gets to about 2 feet in height, when, by taking out the point, and striking it, a strong, vigorous shoot is made in a short space of time. Loam and leaf-mould, the former predominating, with the addition of some sand, is a suitable compost in which to grow them. *A. eremorum* is a little known species, although superior in the matter of colour, some leaves being one-half dull vermilion-red, and the remaining half of the tint of a Copper Beech leaf, and it will occur that these colours appear in bars and blotches. On some of the leaves a secondary growth may be noticed, as if the leaf had some power of doubling itself. *A. macrophylla*, *A. marginata*, *A. Wilkesiana* (syn. *A. tricolor*), and *A. obovata*. These are amongst the best that are worthy of cultivation. The inconspicuous flowers appear as feathery spikes. *W. Harrow.*

PERGULARIA GORRATISSIMA.

This plant belongs to a genus of evergreen glabrous twiners, needing the same kind of cultural treatment as *Petrea*, *Stephanotis*, or the warm-house *Passifloras*. It has greenish-yellow, very fragrant flowers; the calyx is five-parted, and the tube oblong; staminal corona five-leaved. Leaves 4 inches long, membranous, and opposite, cordate-acuminate, and slightly downy.

The plant needs plenty of root room, and, indeed, it is better planted permanently, when large enough, in a 12-inch pot, and the roots allowed to ramble amongst loam and rubble. It is a plant that defies all attempts at keeping it in trim orderliness, and after the winter pruning, which consists of thinning out weak wood, and cutting back that which is left, nothing more may be done beyond training out leading shoots. It is much liked by greenfly, and requires occasional fumigation. It has mostly disappeared from our stoves, because, probably, it is

seen. Scapes nearly 2 feet high, rising close to the bulb, graceful, nodding, woody-pubescent, where it is not covered with sheath-leaves bright green. Sheath-leaves, about five, the upper ones closely appressed to scape, upper ones bright green, with a more developed lamina. Raceme about fourteen-flowered, flowers distant, pink, smaller than in *C. vestita*. Bracts ovate acuminate, finely pubescent green, 1 inch long, $\frac{1}{4}$ inch across. Pedicels with the ovary 2 inches long, pubescent woolly; slender dorsal sepal minutely pubescent, lanceolate acuminate, acute mucronate, $\frac{1}{2}$ inch long, 1 inch broad. Petals shorter, and more spatulate. The lateral sepals resemble the dorsal one, but have a longer mucro at the apex. Lip adnate to the column at the base; lamina horizontal; lobes four, erect. Lateral lobes oblong erect, appressed to the column face; rose-pink, blunt; isthmus fairly long. The two terminal median lobes are rounded at the apex, somewhat divergent, with a small tooth between. The spur is stiff and curved, $\frac{1}{2}$ inch long. The whole flower is rose-pink, just the colour of *Limatodes rosea*, except at the base of the lip, which is darker, and there are three raised lines. The column resembles that of *vestita*, the clinandrium fairly deep, the rostellum bilobed, the lobes short and rounded, deflexed; the anther helmet-shaped, yellow, with a pink edge. The pollinia eight, in two packets, with a small oblong disc, all equal, and narrowly pyriform.

deficient in showiness, and is of no use as a cut bloom; but for filling up a sunny corner, and diffusing a most delicious fragrance it is worth growing.

PETREA VOLUBILIS.

The above is a climbing shrub from Brazil, at one time often met with in stoves and warm conservatories. It is an evergreen, with opposite, coriaceous, oblong, undulate leaves, 6 inches in length, and 1½ inches in breadth. The flowers, which appear in July form long pendent handsome racemes, have a five cleft violet-coloured corolla, and a blue calyx tube. The former is of short duration, but the latter, the most attractive, part of the blossom remains for a considerable period of time on the plant. The plant will grow in enriched loam or loam peat, and a little leaf mould and silver sand, the well-drained pot or tub in which it is planted being plunged in a hot bed or stood over the hot-water pipes. Propagation is by means of cuttings of the half-matured wood in a hot bed.

DORONICUM PLANTAGINUM ENGLISHUM.

This is one of the best early-flowering hardy plants, and deserves to be planted in every garden, its blooms being of a bright yellow, and the size of small Sunflowers, which they resemble when expanded. The plant grows about 15 inches high, has stout stems, and hirsute pale green leaves, and the flowers are erect on the ends of the shoots, making them valuable when cut. Increase is by division of the plant, and may be effected at almost any time, but best early in the spring when the growth is commencing. The crowns may be planted in good soil, with manure well buried. *J. Sheppard.*

SPRING FLOWERING IRIS.

Two of the prettiest of all the spring Iris lately in flower are Iris persica and I. Rosenbachiana, of which I beg to send you original sketches (figs. 91 and 92), made on March 10 in the Trinity College Botanical Gardens, Dublin, in the open air. Other kinds now past are Iris reticulata cyanea, I. "J. G. Nelson," the bright little yellow I. Bornmuelleri, and we have had flowers of Iris stylosa alba, and the "Snakes-head," or "Widow Iris;" I. tuberosa, a fragile little flower that has a sombre appearance, suggestive of apple-green satin and black velvet. The typical Iris stylosa of Algeria has yielded odd blooms ever since Christmas, and quite lately a large tuft of it, covered by a frame light elevated on posts, gave us quite a dainty crop of its soft lilac buds and blossoms. The typical Iris reticulata is after all one of the sweetest and most useful of all the spring blooming kinds, and has become luxuriant since Mr. Bedford, of Straffan, taught us the right way to grow it in peat, sandstone grit, and cocoa-nut fibre refuse. The rich violet-blue flowers are deliciously scented, and our friends and visitors have been quite delighted with them this season.

One of my pet Irises is the old I. persica, which, apart from its beauty, is quite of historical interest, since it forms No. 1 of that splendid series of plates issued in the *Botanical Magazine*. It was formerly the fashion to grow its roots in water-glasses, as is now occasionally practised with Hyacinths, but in a deep sandy peat-bed the bulbs are far more robust, and more permanently healthy. The flowers of this species are of a delicate blue tint, verging to green, the hue of a thrush's egg, for example, and there is a velvety blotch on each of the "falls" around the end of the rich orange crest, and some dark dots and markings help to emphasise the satin-like delicacy of the petaloid styles or standards, as Iris-lovers call them.

One of the most robust of all the newer species seems to be I. Rosenbachiana, which bears a bold little flower, similar in shape to I. persica, but of a smoky lilac colour, having a rich dark blotch on the falls, lit up by a vivid orange ridge, or crest, on a nearly white ground. It is strong and beautiful, and

promises to be quite an addition to a very beautiful group. Some of us are a little taken aback at the statement on p. 292 as to their not being suitable flowers for cutting. So far as I have tried them, all the species and varieties of Iris are quite delightfully adapted for cutting, provided that they be cut in the full grown bud stage, and not allowed to open on the

story is clearly and briefly told by Dr. Charles Waldstein in the March number of *Hesper's Magazine*; and in the same number, Mr. Charles Dudley Warner devotes his critical and amusing pen to the consideration of the Chrysanthemum and its beauty and influence in our gardens to-day. *F. W. Burbridge.*

COOMBE WOOD.

THERE is no more delightful resort for the plant lover than the famous nurseries of Messrs. Veitch, near to the Norbiton station of the South Western Railway. Go when one may, there is sure to be something to attract attention and excite admiration, while the care and attention to the details of culture which are so remarkable in what Messrs. Veitch undertake are by no means lacking here. The nursery and its beautiful site have been so often described in these pages, that it is needless to enter into detail concerning them. The noble avenue of Araucarias and Wellingtonias, the Roses, the Rhododendrons, all have been described over and over again. It must suffice now to extract from our note book a few discursive memoranda concerning some of the plants that attracted our attention on a May morning. It was too early to expect much in the way of flowers, even among the flowering shrubs, and too early also to inspect the deciduous trees, but the brilliancy of the Japanese Maples on the sunny slopes supplied a flush of colour that no flowers could surpass. The number of these Maples is now legion, varying chiefly one from the other in the degree to which their leaves are cut, and in the tint of the foliage from light green to rose-coloured and purple. A "break" of *Kidmota glauca* in full flower made one wonder why these old favourites are not more often seen. *Magnolia stellata* is a newer ac plantaince, but every one who sees its beautifully starry white flowers will admit its pre-eminence claims to figure among the most ornamental of flowering shrubs. The Azaleas of the mollis section are last coming into flower, their delicate soft tints being very beautiful. Art critics fond of airing technical terms would speak of the "morbidize" of these flowers as something to excite admiration! The Rhododendrons are showing for bloom, and will make a fine display later on. Meanwhile, in its way, nothing can be more showy than *Cytisus præcox*, with its long spikes of creamy-yellow flowers. *Pyrus Maliei*, too, is in full flower, and for garden purposes is quite distinct from *P. japonica* in foliage, flower, and fruit.

Acalea Vasyii.—A species in the way of *A. mollis*, producing flowers with the leaves. The texture of the leaves is thin, the margins revolute, and the midrib provided with thinly scattered stiff hairs. The calyx is minute, scaly, and viscid. The corolla about an inch long, pale rose, irregularly curved, tubular, with a limb divided into five oblong obtuse lobes, the three upper of which are spotted near the base with brownish spots. Stamens eight, of unequal length. A very pretty species, which, if it will bear forcing, would make a very desirable subject for that purpose, or for hybridising.

Genista Androuna.—This is a newly described Broom, which has been figured in the *Revue Horticole*, and which is remarkable for the rich golden-brown of its velvety side petals or wings. At present we have only seen one or two flowers, but if we may judge from them, the beauty of the plant must be something remarkable.

Almost as brilliant as flowers, in some cases quite as much so, are the expanding buds and fresh young foliage of the Conifers. The golden Lawson's Cypress and the golden form of *Taxia occidentalis*, known as *George Peabody*, are resplendent in their coats of gold, and are probably the two most brilliant golden Conifers known. Among others with similar coloration mention may be made of—

Juniperus prostrata aurea.—A very effective form, with loosely arranged, ternary, needle-shaped, bronzy leaves. The tips of the young shoots are of a golden colour where exposed to the light.

FIG. 91.—IRIS PERSICA.—COLOUR PALE GREENISH-LILAC, ORANGE CREST, AND DARK BLOTCH AND MARKINGS.

plant, Iris reticulata and all its forms, I. stylosa in variety, I. Rosenbachiana, I. persica, and all the great Flag Irises yield exquisite blooms as cut in the bud state and opened in water indoors. Certainly if allowed to expand on the plants, or to remain long open in the open air, nearly all Irises are fragile and fugacious enough, and one might paraphrase dear

FIG. 92.—IRIS ROSENBAKHIANA.—COLOUR LILAC PURPLE AND WHITE, CREST ORANGE.

old Robert Herrick who lamented that the Dahodils 'wasted away too soon.'

We are all very much indebted to Professor M. Foster for the enthusiasm he has himself displayed, and stirred up in others, with regard to these exquisite flowers. As a genus there are few, if any, so generally beautiful, or that can boast of some species or other being in flower in the open air every day in the whole year. The somewhat recent discovery of the lovely head of Iris from the Parthenon frieze seems to some of us quite a good augury, and its

J. canadensis aurea, is of denser habit than the foregoing, and the leaves of a deeper green, not bronzy hue.

Retinospora filifera aurea (hort.).—A form of the very elegant plant called in gardens by the above name, and distinguished by its golden colour.

Chamaecyparis sphaeroides var., a beautiful form of the dwarf Cypress, in which the tips of the shoots are brilliant yellow.

Picea excelsa mutabilis.—A variety of the common Spruce, in which the young expanding shoots are of a creamy-yellow colour and very beautiful in the sunlight.

Abies orientalis aurea.—The young shoots of this variety are of a creamy-yellow colour, not so effective as many others, but no doubt opinions would differ as to its beauty.

Abies Webbiana.—This noble Silver Fir needs no notice now further than an allusion to its buds, which form trumpet-shaped masses at the ends of the shoots, the numerous overlapping pale brown bud-scales forming a delicious contrast with the delicate green of the young leaves. The lower scales are chestnut-brown, rather resinous, the upper ones thinner, fringed at the edges, and more or less hairy.

Abies balsamata.—A handsome and distinct Californian species, which we note now solely for the purpose of calling attention to the contrast formed by the large fawn-coloured bud and the dark green foliage. The buds are solitary at the ends of the shoots, nearly $\frac{1}{2}$ inches long, obovate, oblong, pointed; the lower scales oblong obtuse, suborbiculate, gradually increasing in size, but diminishing in texture near the top.

Among the newer Conifers two may be mentioned as specially interesting, but which are at present not large enough to enable one to form any opinion on their merits as decorative plants.

Tsuga eriolobata.—This is a newly discovered Hemlock Spruce, of which a figure and description will be found in the *Gardeners' Chronicle*, 1856, Dec. 15, p. 781. It is somewhat stiffer than the ordinary forms, the leaves are narrower than in the Japanese forms, some sharply pointed, others obtuse, but not notched at the apex, all finely serrulate near the tips, dull green above, paler beneath. The plants are as yet too small to enable us to form any opinion as to their decorative value.

Picea Omorika.—This is the Serbian Spruce, figured in the *Gardeners' Chronicle*, 1854, Mar. 8, p. 209, and still very rare in collections. In general appearance it is not unlike the Japanese *P. japonensis*, with which, indeed, it has been associated by Willkomm in a special group characterised by the nearly flat, not four-sided leaves. The shoots are fawn-coloured, with a few short, straggling, blackish hairs. The leaves about $\frac{3}{4}$ inch long, linear, mucronate, dull green above, white beneath, with four rows of stomata on either side of the prominent midrib. The buds are small, rounded, pointed, chiefly produced near the ends of the shoots, and covered with brown, membranous, dry, obovate, pointed scales, the uppermost of which form a cap, and are pushed off as the bud lengthens. It is a rapidly-growing species.

P. caedosa *Reinartii* is a remarkable variety of the common Spruce, with a very dense, compact, pyramidal habit, recalling that of *Cupressus Lawsoni erecta viridis*.

A few disjointed memoranda must bring this notice to a close. Later in the season we may hope to pay other visits to this delightful treasure-house.

Fagus Salsanderi.—A Beech with very slender, wiry, spreading branches, and small, rounded, undulate, brownish leaves, each about $\frac{1}{4}$ inch long. A curiosity, resembling in general habit the curious Polygonum, known as *Muhlenbeckia complexa*.

Sambucus racemosa serratifolia.—This is a variety of the red-berried Elder, remarkable for its large and deeply lacinate leaves. It is handsome and free-growing, and may, therefore be recommended for general cultivation in shrubberies where sufficient space can be given to it.

Quercus myrtifolia may be recommended as an

excellent evergreen, and one which, from its thick leathery leaves, is adapted for cultivation in towns and shady places. The leaves are like those of a Privet.

Olearia lucunosa.—We have not seen the flowers of this, but even in its present state it is amply worth notice, the shrub (which is a native of New Zealand), having a peculiar appearance, like an *Aralia*, with loosely arranged, linear leaves, about 7 inches long, half an inch wide, thick, leathery, deep green, and rugose on the upper surface, along the centre of which runs a thick yellow midrib; lower surface covered with dense fawn-coloured felted hairs.

Bambusa tessellata (hort.).—The Bamboo, so named, has broadly lanceolate leaves (6 by 2 inches), which at first are entirely green, but as winter comes on, they die at the margin, leaving the central disc green, surrounded by a broad whitish stripe, which is very effective when seen at a distance. The ordinary *Bambusa* metake of gardens has been much browned by the frost of the early part of March, but, like the *Eucalyptus coccifera*, is not materially injured.

Cytisus Adami.—It was with no ordinary pleasure that we saw a row of *Laburnum* Stocks worked with *Cytisus purpureus* and cognate forms, with a view to test the origin of the famous *Cytisus Adami*. Year after year, as astonished correspondents send us flowers of this variety, we have longed to institute trials at Chiswick or elsewhere, and have in vain pressed the desirability of so doing upon nurserymen and amateurs. Now it appears that, at the instigation of Dr. Romanes, Messrs. Veitch have undertaken the task. No more competent experimenters could be found, and we trust that their careful experiments and records will do much towards illustrating the subject. It must be remembered that graft-hybridisation, once deemed almost impossible, now seems much more easily explicable, since we have been taught by Walter Gardiner, Francis Darwin, and others, of the movement of protoplasm from cell to cell, and the consequent "contamination of protoplasm." Similarly the recent investigations of Strassburger and of Gagnard of the fusion of the two nuclei in the process of fecundation, render such productions, as that we are speaking of, less anomalous than previously they appeared to be.

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM CRISpum VAR.

OUTRAMI, *Orchid Album*, t. 495.

A finely spotted variety of this popular Orchid.

CATTLEYA MAXIMA MARCHETTIANA.

A native of Ecuador. The bulbs of this fine variety are club-shaped, and distinct from those of any other *Cattleya*. Each bears only a single leaf. The flowers are 5 inches across, deep purple, blotched with crimson-lake. A noble flower, figured in the *Orchid Album*, t. 491. Mr. Williams points attention to the necessity of exercising judgment in the matter of shading which is often continued after the danger from too great exposure is passed.

LÆLIA DORMIANNA.

Segments narrow, lanceolate, olive-green, with purple spots, lip three lobed, lateral lobes erect, convolute, pale lilac, central lobe flattish, roundish, rich violet. Mr. Williams doubts the alleged hybridity of this species, which is a native of Rio Janeiro. It has evergreen leaves, and flowers in late autumn or early winter. The same treatment as that appropriate for *Lælia elegans* is recommended for it, *Orchid Album*, t. 490.

CALANTHE MYLESIX.

said to be the result of a cross between *C. nivalis*, a white form of *C. vestita*, and *C. Veitchii*. The flowers of the new hybrid are of the preest white,

with a tinge of yellow on the crest at the base of the lip. It is recommended that *Calanthes* should be grown in pots or in baskets suspended from the roof.

DENDROBIUM WARDIANUM VAR. LOWI.

Lindenia, t. 225. A robust form of this splendid Orchid, which is identical with *D. Wardianum* giganteum.

LÆLIA ANCEPS, VAR. HYEANA.

Lindenia, t. 226. A fine white variety with very broad segments, the lateral lobes of the lip striped with purple at the base. The centre is flushed with yellow.

PHALÆNOPSIS SCHILLERIANA.

A fine illustration of this handsome species is given in the *Lindenia*, t. 227.

CYPRIPEDIUM BARBATO × VEITCHIANUM.

Lindenia, t. 228. A handsome hybrid, with tessellated foliage, and flowers intermediate in character between those of the parents.

MILTONIA VEXILLARIA AT MERTON.

Eight hundred plants of one species of Orchid is a large number to be found in one garden, yet there are more than that number of *Miltonia vexillaria* in Wm. Hand-ell Cannon, Esq.'s Garden at Avenue Lodge, Merton Park; and considering the beauty and wide variation in colour of this handsome "Banner Orchid," there is ample excuse for forming such a large collection of them. The plants, which have all been grown from very small imported pieces, have that beauty of health and vigour which would cause envy in many who do not grow this section of *Miltonia* to perfection; they are all of the large-flowered type, and are, for the greater part, yet in bud. Among those already expanded are two extraordinary forms, the one with lilac-veined flowers, the other with bright rosy-crimson flowers, edged with white, the petals being white, with a yellow line down the middle. A batch of M. Roezlii, and a few of M. Phalænopsis doing equally well, prove that Mr. Cannon has grasped the proper method of growing these plants. So far as we can glean the method pursued is very simple: the plants are on the side stages of a cool-house which is not allowed to get below 50° or so in winter; they are in comparatively small pots, and are kept moist all the year round, a dewing with the syringe not sufficiently heavy to run down the foliage, being given daily at all seasons, and in all weather. Beyond this the plants have plenty of light, but not bright sunlight, let in on them, and fumigation which has wrecked many a fine lot of these plants is never resorted to.

In several other neat span-roofed houses at Merton Park are quantities of *Odontoglossum crispum*, *O. Pescatorei*, and indeed a general collection of showy cool-house Orchids, and also of *Lælia* and *Cattleyas*. *Lælia purpurata* used to be grown and flowered here in marvellous perfection when the plants stood on inverted pots over a tank, but since the tank has been altered and staging fixed to them, although good, are not so fine as they used to be. Among the *Dendrobies* in flower, *D. crassinode* and *D. primulinum* were specially good. There were also many *Cypripedium callosum*, *C. hirsutissimum*, and others; a batch of *Ada aurantiaca*, *Cattleya citrina*, *C. intermedia*, *Odontoglossum odoratum albidum*, *O. o. gloriosum*, and the various other *Odontoglossums*, *Masdevallias*, *Lycastes*, &c., of the season.

ARPOPHYLLUM GIANTÆUM.

Arpophyllum are amongst the easiest of Orchids to cultivate, succeeding admirably in a light position in a greenhouse. The potting compost should be of a sustaining nature, and may consist of rough, lumpy, fibry peat, with bits of charcoal and broken crocks mixed through it, sticking in tufts of growing sphagnum moss all over the surface. As they enjoy copious supplies of water while growing, the drainage should be good; however, when growth is completed, less water will be required, but they should never be permitted to get so dry as many other epiphytal subjects. *A. giganteum* is in many respects

similar to the smaller and earlier flowering *A. spicatum*, but it has longer leaves and pseudobulbs; and the leaves and inflorescence are borne at the apex of slender pseudobulbs from a foot to 18 inches in length. The inflorescence consists of densely packed cylindrical spikes, about half the length of the leaves or pseudobulbs; the flowers are of a dark purple and rose colour, and they last several weeks in perfection. The plant is a useful and distinct decorative subject. *F. R.*

DIACRYDIUM DICORNUM.

Some growers tell us that this is a somewhat capricious and refractory plant, and we have occasionally seen it in a condition which seemed to bear out this statement. However, recently I have seen it in several gardens doing well. It is a plant which evidently likes a high moist temperature, a maximum amount of light, and not much material about the roots; thus indicating shallow baskets hung up near to the glass as being proper for it. A year or two ago a correspondent favoured us with a few newly imported bits, which at the time we had little hopes of establishing, and which for many months remained quiescent. Suspended in a basket of crocks on the roof of a low plant stove, young growths eventually were developed which have now produced growths nearly 1 foot long, and these have long ago been transferred to the usual fibry peat, crocks, and sphagnum compost used to fill baskets. These last growths are now producing their fragrant spikes of pure white flowers, or rather white sepals and petals, the lip being spotted with crimson, and the crest tinged with yellow. The flowers are of good substance, and useful for cutting. *F. Ross, Paddock Court.*

MUSHROOM CULTURE.

THERE has been lately a good deal of discussion in the pages of the gardening press on the interesting subject of Mushroom growing, and as the opinions therein expressed are somewhat diversified and conflicting, I am induced to offer a few remarks with reference to my own actual experience.

I altogether waive the scientific part of the subject. I will leave that to others, preferring to stick to the practical part, as one best calculated to be of tangible benefit to growers in general. I give the following account of my procedure, with the one simple object of perchance being of some little help to those who may possibly have some-times failed in their attempts to produce paying crops of this much coveted esculent, believing, as I do, that a free circulation of opinion, and more especially of actual experience and results among English growers—not only on the subject of Mushrooms, but on all other matters connected with the market produce of garden and glasshouse—would at least assist in stemming the flood of foreign importations, and thus benefit the hard-working British growers.

I am a grower of Mushrooms for market on a moderate scale, and have no reason to complain of want of success hitherto in a pecuniary point of view. I have no properly constructed houses, but grow the Mushrooms on the floors of unheated sheds, in summer, and in the paths of my glass-houses all the year round, and the following includes my *modus operandi*.—

Preparation of Manure.—This I procure in large quantities at a time; or, say, I have four empty beds that I wish made up. I procure the manure for these all at one time, and just as it is thrown from the stables. This I throw into a heap in the open air, without removing a single straw, no matter how rough and strawy the mass may be. This heap I turn, on an average, three times a week, and it is exposed during the time to all weathers. If the heap be very rough and strawy, it will be sure to heat dry and white, especially if no rain falls during the process of turning and "making." In this case I add water freely during the act of turning, which assists in the "making." During high winds the process of heating is retarded, and when this occurs I tread the heap hard down, and shelter the weather

side with boarding, which I have always at hand. The process of making, if the dung is "long," generally occupies about four weeks; if shorter, about three. When the dung, from the effects of turning and watering, becomes moderately short, brown-coloured, hot, and moist, but not wet, it is ready to be put into the beds.

Making-up the Beds.—These I fill up to a depth of 12 inches with the prepared dung. The mass is well shaken up as it is brought into the house, and as evenly laid down as possible, and is then at once trodden down firm; the depth of dung, when hard trodden down, will usually be about 9 inches. I consider this quite enough, and any more merely a waste of manure. I can remember once running rather short of dung, and forming a bed that, when trodden down, was not more than 6 inches thick, and it did quite as well as the thicker ones put down at the same time.

Spawning.—My rule is to insert the spawn the moment I find the heat is not on the rise, which I find out by the thermometer; but I do not hesitate to spawn in a good strong heat, believing that to be much better than to allow the beds to fall to anything like a low degree of temperature. I use the spawn in goodly pieces, and at the rate of about 1 bushel to 50 square feet. These pieces are tacked in, as it were, under the dung with the aid of pointed pieces of iron $\frac{3}{4}$ inch in diameter, and about a foot long. With such instruments the work of spawning can be got through very rapidly.

Siding the Beds.—This work I perform the moment the beds are spawned, putting on a layer of about 2 inches in thickness when rammed down, which is done at once. I use fresh loam when I can get it, but when not procurable, I use ordinary garden mould, and after an experience extending over some years, I must confess that, so far as regards the quantity of Mushrooms produced, the one kind of soil seems to be quite as efficacious as the other. The only advantage maiden mould has over ordinary garden soil is, that it produces fewer weeds, which of course is a consideration. But rather than go to the expense of bringing fresh loam from great distances, I would prefer to use ordinary garden soil.

Watering.—This I often think, is the most important point in Mushroom growing, especially under glass roofs, and where there is no foliage above to protect the beds from the rays of the sun. When I first began Mushroom growing in the paths of my houses, this question of watering puzzled me greatly. My beds were continually getting dry, and I kept as continually watering them. I felt that all this was wrong; so, until I could think out a better plan, I covered my beds with a thin coating of clean straw all over, which answered fairly well, the straw preventing such rapid evaporation as took place before. There was, however, this to be said against it: first, that one could not see when the Mushrooms made their first appearance on a newly-formed bed, which we are anxious to do; secondly, when the Mushrooms had to be gathered, there was always a great deal of trouble attached to the removal and replacement of the straw; and, thirdly, the straw proved to be an undoubted shelter for woodlice and slugs. After a little thought, I hit upon a plan which I at once adopted, and have had working for some years with very satisfactory results. I shall here attempt to describe it. The paths of the houses are, of course, excavated to the depth required for the reception of the dung, and lined on each side with brick walls, one brick thick. Fixed into these, at intervals of 6 feet, are crossbeams 3 inches by 3 inches, and on the top of these, in the middle of the bed, and nailed to the cross-pieces, runs a thick plank that will not spring. This is used as a gangway, or place to walk and wheel on. Lengths of wood of the same dimensions as the cross-pieces are fixed on the top of the walls running the whole length of the bed. On these are hinged shutters, made of wood, an inch in thickness, on each side of the gangway, and 6 feet long, or so that each shutter will catch on the cross-bars for support when down, and so wide

as to fit closely to the gangway, and the arrangement is complete.

For examination of the bed, watering, weeding, and gathering crop, all that is required is to raise a shutter where you please—by the way, they are all fitted with wooden handles, firmly secured—and set it back. It then stands upright, having for support the greater part of the thickness of the wall-plate. When the examination is over, the shutters are gently laid back in their places, and all is darkness and comfort underneath.

This arrangement is a little expensive at first, but that is soon covered by the saving of labour, and the greater comfort in working the beds. With this arrangement the workpeople can walk on the gangway and shutters over the whole surface of the beds in prosecuting the work of training Vines or Tomatos, as the case may be; whereas, with only a single plank running up the middle, slips of the feet were constantly occurring, much to the detriment of the Mushrooms underneath.

After spawning and moulding, the beds are allowed, of course, to remain without water till nearly the end of the sixth week, when they receive a gentle sprinkling of tepid water daily till the moisture reaches the manure, after which the Mushrooms soon appear. When this takes place, the boarding on top of the beds is kept wetted by the syringe three or four times a day, according to the weather, which has a wonderful effect in keeping the beds below in a uniform state of moisture.

I may mention that when I began to grow Mushrooms first in my glasshouses, I had the bottoms of the beds concreted, but partial, and sometimes total, failure was the result. Judging the cause, I had the concrete removed, with good crops as a result.

In conclusion, I may state that my average yield of Mushrooms per square foot of bed, is about $\frac{1}{4}$ lb., which yields a satisfactory profit. *Market Gardener.*

WHAT IS BEAUTY IN COLOUR AND FORM?

ON APRIL 22 there was a fine show of Primulas of all sorts at the Drill Hall; there was also a small collection of Amaryllis. One of these (I think its name was *El Mahdi*) was of a deep rich crimson throughout; it had not the orthodox broad petals that the florist adores in this flower, and, moreover, it had not the orthodox form of overlapping petals. While I was admiring the grace of this particular flower, I heard a gentleman tell the man in charge, "If you can get that colour into that form"—pointing to the *Empress of India*—"it will do."

Now, that crimson Amaryllis, to my mind, had great artistic beauty of form, and it had a particularly interesting slight curl in its petals, which the *Empress of India* has not, and cannot have, owing to its great breadth of petal and regular form. Here is a case of what may, perhaps, be called seeing a flower only through a florist's spectacles. He feels a craving for reducing all variations of form, in any group of flowers, to one dead level—a glaring wheel-like, broad-petalled uniformity. The botanist has, I think, the advantage of the florist; he revels in wild forms, and fails to be delighted by the tailoring of all the exquisite little natural oddities and variations into a uniform pattern. I think the rising generation of horticulturists would be able to see beauty in other forms than a regular circular outline if, besides a training as horticulturists, they were able to get a training from an artist's point of view.

I might, perhaps, be told that the commercial florist is a manufacturer, and he produces what people care to buy. But is this so? Has training in art in the manufacturer nothing to do with the tastes of the people? Perhaps it used to be thought so, but now, instead of the staring red, blue, and yellow fabrics which at one time met the eye, we see the most exquisite shades of colour arranged in a hundred ways, so that the shops are filled with an optical music, which gives repose and contentment to the brain. All this is the effect of training manufacturers in a new art—the art of appreciating

other colours than staring colours, and other forms than round and square.

It is the coquetish quaintness of form in Orchids, varied in a hundred ways, which produces a never-ending fascination. The same small number of elements—three sepals, two petals, a lip, and a column varied in an infinite number of ways, with as many various tints—can produce all the kaleidoscopic variations of Orchids. If they were all made round, they might still possess the charm of uniformity, which is perhaps not a trifling one, but they would lose the charm of variation.

That El Mahdi had a pignory of form of his own, it would be a pity not to retain it, and breed others in that direction. Size, roundness and broadness of petals are not the only charms of flowers. *E. B.*

GAYLUSSACIA FRONDOSA.

The genus *Gaylussacia*, named in honour of Gay Lussac, a celebrated French chemist, 1778—1850, belongs to the natural order Vacciniaceæ. There are about forty known species, but little grown, half hardy evergreen or deciduous shrubs, of American origin. *G. frondosa* has purple-green flowers, disposed in a few axillary slender racemes. These appear in May and June, and are succeeded by dark purple berries with a white bloom, like our own Whortleberry, and, like them, are pleasant eating when cooked. Height, 3 to 6 feet. For our illustration (fig. 93) we are indebted to Dr. Dieck, of the Arboretum, Merseburg.

THE ECONOMIC USES OF LEAVES.

Of the three divisions of Nature's products, man is most chiefly indebted to the vegetable kingdom, whether for his food, medicine, or domestic comforts. Every part of plants and trees is more or less utilised by savage and civilised men, and a common category might be furnished by the various uses of the separate parts—the roots, stems, sap, bark, fruit and seeds, and leaves. If we take the last-named, the foliage, apparently the most insignificant part of the plant, how dependent are we on these for food, clothing, medicine, dyes, stains, and various comforts.

The miscellaneous application of leaves for different purposes as domestic appliances, and for manufacturing uses, of themselves, would furnish a long list; some few of these we may pass under notice, because their adaptability and usefulness are mainly confined to tropical countries. It is true that some leaves have been utilised by the paper-maker, as in those of the Dwarf Palm, Maize leaves, and others, but this is only on a small scale.

The leaves of many Palms are largely employed for making hats. Those best known are Panama hats, so named from being shipped from that port. These are made from the finely-plaited fibre of the leaves of a South American Screw-pine (*Carludovica palmata*). These hats are much prized for wear in the Tropics, being light and flexible, and can be washed and bleached repeatedly. The tree has no stems, the leaves have long slender petioles, springing from the ground; they are each 2 feet long, fan-shaped, and four-parted, each segment being again ten-cleft, so that when folded in venation, each segment on its own rib, there are eighty layers in a young leaf. The tree occurs only on the slopes of the Andes. About 200,000 dozens of these hats are made in Ecuador and different States of South America. These hats are distinguished from all others by consisting only of a single piece, and by their lightness and flexibility; they may be rolled up and put in the pocket without injury. In the rainy season they are apt to get black, but by washing with soap and water, besmearing them with lime-juice, or any other acid, and exposing them to the sun, their whiteness is easily restored. The plaiting of the hats is very tedious and troublesome; the coarse ones may be finished in two or three days, but the fine ones take as many months to plait. It commences at the crown, and finishes at the brim.

The hats are made on a block, which is placed upon the knees, and requires to be constantly pressed with the breast. The hats vary in price, according to fineness and quality, from 20s. to as many pounds.

The unexpanded fronds of *Livistonia australis*, prepared by being immersed in boiling water, are dried, and the fibre thus obtained is much valued for the manufacture of hats in Australia, which much resemble the celebrated Panama hats.

The rough leaves of the Chunico (*Curatella americana*) and of *Davilla lucida* are used for cleaning iron, and polishing and scouring wood. *Curatella alata* is used in the West Indies for polishing bows, sabres, &c.; and *C. sambaiba* in Brazil—indeed, they serve all the purposes of sand-paper to the Indians for polishing their blow-pipes and war clubs. The leaves of *Celtis orientalis* are used for polishing horns in the East Indies.

foot in breadth, and the same in length. Sewn together with twigs, they also serve for baskets for holding pepper, turmeric, and ginger, and are likewise used for thatching.

Under the name of "Chattahs," a kind of umbrella hat or sun-shade is made in the East of the leaves of the *Liencala peltata* and the Talipot Palm, or a Plantain leaf. These Chattah hats are much worn by the ploughmen, cowkeepers, and coolies of Bengal and Assam.

The large fan-shaped leaves of the Talipot Palm (*Corypha flabelliformis*) are like those of the Palmyra Palm, carried over the heads of people of rank as an umbrella, and are also used for making books, and for various domestic purposes. The leaves are also cut up into neat bracelets, worn by Santal girls in India. Those of *Vanda Roxburghii*, split, are also worn by them as anklets. Those of another

FIG. 93.—*GAYLUSSACIA FRONDOSA*: FLOWERS GREENISH-PURPLE; BERRIES DARK BLUE WITH A WHITE BLOOM.

The foliage of *Guaiacum officinale* is very deterring, and is frequently used in the West Indies to scour and whiten floors, which it is said to do better than soap.

Leaves sown together are much used in India as substitutes for the plates and dishes of more civilised life. It is not always poverty that leads natives to use them in preference to metal or porcelain articles, as caste or custom has often some influence in the matter. The leaves principally used are those of the Egyptian Lotus (*Nelumbium speciosum*), *Bauhinia* species, *Semecarpus anacardium*, *Butea frondosa*; those of the Banyan (*Ficus bengalensis*), by Brahmins, and the Plantain-leaf (*Musa paradisiaca*).

The leaves of *Bauhinia Vallii* are used in the construction of the curious, rude leaf-bellows in Sikkim, with which the natives of the hills smelt iron. These leaves, when sown together, are used as plates, cups, rough tablecloths, rain-hats and caps. The leaves are heart-shaped, and above a

species, *Borassus aethiopicus*, occur as much as 12 feet across; they serve also for the manufacture of baskets, mats, ropes, and sieves. The leaves of *Nipa frutescens* attain a height of 15 to 20 feet, presenting a very handsome appearance, resembling the fronds of huge Ferns. This graceful Eastern Palm is utilised in various ways, the principal being in the manufacture of thatching for house-roofs, in the East called "Ataps." This manufacture is quite an industry of itself, and affords employment to many natives, chiefly women, the men simply bringing cargoes of the fronds to the women, to be stitched with split rattans, and made up. Atap roofs are the best adapted for these climates, for while the winds are never strong enough to blow them away, they afford the coolest protection against the sun of any kind of roofing known.

The leaves of the Palmyra Palm (*Borassus flabelliformis*) were formerly used like paper, to write books on, and to this day they are applied to this purpose in Orissa, Southern India, and Ceylon, where an iron

style is employed to write upon them; in certain parts of Bengal young children use them to write the alphabet lessons on. They are largely employed for making pans, bags, winnows, hats, umbrellas, and for thatching, &c. The leaf takes a dye well, and is worked up in Madras into pretty coloured patterns in baskets and mats.

The slips of Talipot and other Palm leaves are coming into European commerce for the manufacture of ornamental braids, and in the construction of straw, or L-ghorn hats. The fibre obtained from the base of the leaves of the Chusan Palm (*Chamrops Fortunei*) is used by the Chinese for making hats and coarse clothing. The sale of Palm leaves for decorative purposes in the towns of Elche and Alicante in Spain, produces a considerable income to the towns.

Kadjan mats, manufactured out of Nipa leaves, are

the alkaloid papain which they contain, and which acts as a solvent.

For cordage and other textile purposes, numberless leaves are used, and they serve very generally for packing and wrapping up small parcels in India.

In Guiana, Tibisiri fibre is obtained from the inner surface of the spiral leaves of the Ita Palm (*Mauritia flexuosa*); it is used by the Indians for making hammocks, &c. The leaves are cut before they are open, and the midrib separated by drawing each division of the leaf through the finger and thumb. After drying, the fibre is ready for use without further preparation. About a quarter of a pound may be procured from each leaf, and if the central leaf is left uninjured, no evil effect is produced on the tree. Bags or matting could be cheaply and easily made from this fibre, as well as hats, similar to those known as Panama

by themselves, for solitary plants on the lawn, or the front parts of shrubberies. They do best in soil that has some peat in it, and repay good cultivation. We are indebted to Dr. G. Dieck, of the National Arboretum, Zoeschen, near Merseburg, Germany, for our illustration.

NURSERY NOTES.

MR. BULL'S ORCHID SHOW.

The unequalled show of Orchids in flower at Mr. Bull's establishment in the King's Road is open for inspection, and, as usual, draws daily great numbers of admirers of these beautiful plants. The same house as before is set apart for the plants, and we think that, if anything, more good taste is displayed in its arrangement; the banks of blossoms are smoother, the colours harmonised better, and there is what has to be considered in so limited a space, more elbow-room; and, need it be said, the courteous proprietor and his assistants are ever at hand to afford the visitor every information that may be needed. Mr. Bull tells us, and we believe him, that the display of bloom is better than heretofore at this early part of the season. There are indeed fewer *Cattleya Trianas*, these flowering early, and not to be easily retarded, but the paucity in this respect is more than compensated by the fine-blossomed *Miltonia* (*Odontoglossum*) *vexillaria*, *Odontoglossum crispum*, *O. Pescatorei*, and *Cattleya Mendelii*, in considerable variety.

Of varieties of *Miltonia*, mention should be made of *M. vexillaria picta*, with deep mauve ground colour on the broad lip, and a margin of white round the upper segments of the bloom; another *M. v.*, named *rubra*, has deep colouring, but no bordering of white. The older *M. v. strinta* seemed to be getting numerous, and the old style of *M. v.* were, so to say, all over the place. Amongst these nothing very large, and consequently of great price, was noted, but all were nice marketable stuff.

The numerous *Odontoglossum citrosimum*, which add so much to the pervading fragrance of the house, are in much variety, ranging from pure white to white shaded with rose or light purple. Nearly all are hung up, and show good culture in their massive bunches of blossoms. *Cymbidium Lowianum*, with their long streamers of sulphur-green blossoms, with an intense crimson-coloured lip, were the conspicuous plants of the collection.

*Dendrobium*s, not numerous but very conspicuous, were *Farmeri densiflorum*, and a new form of it with primrose-yellow lip instead of an orange-coloured one, as in the type—a distinct pretty thing; *D. Brymerianum*, small plants, the colour very desirable where all or nearly all is white, purple, and scarlet; *D. Deari*, *D. Wardianum* in a basket, an object of much beauty—no one should train these pendent *Dendrobies* to upright sticks; it is barbarity. In *Cattleyas* mention should be made of the following:—*C. Mossiae margizata*, *C. illustris*, a *Mendelii*, with a very superb lip, and markings of the same colour on the sepals; many *C. Mendelii*, showing large flowers; and some variations from each other; *C. M. imperialis*, a large plant, is one of the finest, and almost equalled by *C. M. princeps*. *C. Schroderi*, many of these, some varying somewhat in tint, the filling round the lip in some instances excessive—always a point to admire—and in several the orange interior of the throat more or less conspicuous, called for notes of exclamation. *C. Lawrenceana* has almost extinguished the older *C. Skinneri*, which looks of a miserably pale shade of purple beside it; of the former, the collection was rich in specimens of good size, and healthy. *Angraecum modestum* is pretty always, and in a basket more especially, numbers of this plant in bloom were observed. Another small flowered gem is *Ornithochephalus grandiflora*, the specific name an absurdity for a minute green and white flower, no larger than a Lily of the Valley. It is green and white coloured, and blooms in short clusters. Taken as a whole, the

FIG. 94. *DIERVILLA MIDDENDORFFIANA*. FLOWERS SUFFICIENTLY WHITE.

indispensable for travelling purposes; packed up in the smallest compass when not required, each mat is capable of affording sufficient cover at night for two or three persons, either in boat or forest journeys. They also form, almost exclusively, the material for side-walls and divisions within houses. The young leaf unfolded and dried, under the name of Roko, forms the favourite covering for cigarettes in the Malayan Peninsula in preference to paper.

The large leaves of the Teak tree (*Tectona grandis*) are used for plates, for packing, and for thatching. The leaves of *Cordia myxa* are employed as plates in Pegu, and to cover Burmese chiroots. In Bangalore the leaves of *Canna indica* are used by the natives in lieu of plates, to serve their Kagi or Millet puddings and other dishes on.

The leaves of the Papaw tree (*Carica papaya*) are employed by the negroes in washing linen, as a substitute for soap. They have also the property of rendering meat wrapped in them tender, owing to

The foregoing is only a brief enumeration of some of the many uses to which leaves are industriously applied. *P. L. Scaevola*.

DIERVILLA MIDDENDORFFIANA.

THE above-named species is one of a handsome genus of hardy deciduous shrubs, better known in gardens under the older name of *Wiegela*, of which *rosea*, *anabalis* (*grandiflora*), and *Loysmanni aurea variegata*, and some variegated forms of the first two species are generally grown. The first is white and rose; *grandiflora* has pink flowers, which are larger than those of the other species, and the last named is a new variety with green and yellow foliage, and named after the raiser.

The species figured (fig. 94) has sulphur-yellow blossoms, Gloxinia-like in form, and is in beauty not excelled by any other of the genus. *Diervillas* are plants of graceful habit, well adapted for groups

most numerous class of Orchids in the show-house are Odontoglossums, and of these the variety is very great, the flowers and flower-spikes most unusually large and massive, the *O. crispum* more especially. These latter, owing to the numerous importations from the best districts, are fast becoming less stellate in form of bloom, and thicker in sepal and petal—both improvements of great value in a flower that is used so much when cut from the plant. One form of it, named *delicata*, has brown spots on a white ground. Of distinct species of Odontoglossums we may specify some that Mr. Bull exhibits at the present time:—*O.* notable, from United States of Columbia; *O. triumphans chrysolorum*, much more golden than the type, and therefore showier—the barring is less marked; *O. ornatum*, a natural hybrid form, very showy in creamy-white and brown; *O. Marshallianum*, with very fine large spikes of yellow and brown bloom; *O. Edwardi*, a fine spike of flowers of a purple colour, small in size, but numerous; *O. (Miltonia) Roezlii*, the well-known *O. papilio*, a gorgeous brown moth, suspended apparently on nothing at all when seen from a little distance; *O. Ehrenbergii*, apparently of the *Cervantesi* section of Odontoglossum, but the lip is smooth at the margin instead of fringed, and no spotting is remarked on the upper segments of the blossom; and of *Cervantesi* many were noticed grown in small baskets. *O. cordatum*, with brown sepals and petals, and a white heart-shaped lip, is a conspicuous and distinct species; and some flowering *O. Harryanum*, in their rich brown and primrose-yellow, were noted; also *O. Halli leucoglossum*, with white lip minutely fringed.

Lycaste Skinneri were not yet out of bloom, and *rubella picta* was in flower—it is a very nice thing; also *L. S. alba*; *L. gigantea* carried a few of its peculiar dull-coloured blooms. *L. Schilleriana* was another of modest colouring, and belongs to the same section as *L. plana*.

The plants of *Laelia purpurata* were healthy, large, and well bloomed; and mention may be made of *L. p. Russelliana*, with splendid markings; *L. p. Victoria*, a remarkable variety, with creamy-white sepals and petals, and very rich purple lip, was one of the best in the show. It is a plant which contrasts well with the more common form of *L. purpurata*. The display was brightened in places by groups of *Mastervallia Lindeni*, *Harryana splendens*, and *H. coccinea*, and the more curious looking *conchifera*, *trochilus*, *chimera*, and *Benedicti*. Here and there were inserted small colonies of *Cypripedium* of the best forms, as *Curtisi*, *caudatum*, with very fine lip and long tails; *Sallieri*, and *selligerum majus*.

Of other species of note there were:—*Gongora portentosa*, sepals and petals white, spotted with brown, and a lip bending backward of pale yellow; several *Oncidium*s, including *corigerum*, *biconutum*, *superbum*, and *fuscatum*. Several *Vanda savais* well bloomed; the rosy red *Mesospidium sanguineum*, well furnished with its sprays of bloom; *Scuticaria Dodsoni*, *Angraecum Leonis*, *Brassia Kayi gigantea*. *B. Keiliana*, a curious flower, with one half of the bloom ascending perpendicularly and the other descending; the lip is creamy-white, and other parts dark brown in colour. Plants of *Cymbidium eburneum* were numerous and well flowered.

Without professing to give a list of all the species of Orchids in the show, the above will be found to contain nearly everything that is choice or rare in a very fine collection.

From the reserves, fresh plants in variety will take the place of those past their best, and in that way the interest in the show will constantly be renewed until the end of the season.

EFFECTS OF GRAFTING.—We have read of some strange attempts at the renewal of youth lately—attempts which seem more tinged with romance than founded on fact; but gardeners are familiar with the process, and Mr. Blackmore tells us that when he desires to rejuvenate an old Pearstock he can generally succeed in so doing by engrafting upon it a scion or scions of Pitangon Duchess. On the other hand, Duchesse Piégoe, when grafted on a stock, almost as surely kills it.

TREES AND SHRUBS.

RIUS (SUMACH).

THERE are several varieties of this shrub in cultivation. *R. Cotinus*, *R. glabra*, and *R. glabra laciniata*, are the most desirable varieties to grow in ornamental grounds. The large terminal panicles of flowers of *R. glabra* are succeeded by bright red berries, and the handsomely cut feathery leaves of *R. glabra laciniata* have a telling effect. The plants flourish in any light rich soil and away from the shade of trees, and attain a height of from 5 to 9 feet, according to variety, soil, and situation. The shoots should be thinned out and spurred in every year, in order to secure a good supply of strong young shoots well furnished with leaves. *H. W. H.*

CYDONIAS,

of which there are several varieties, are all showy plants, and are first-rate for rockwork or raised places, as they trail and show off in such situations to advantage. The scarlet-flowering kinds are very brilliant, and have blooms as large as those of a wild Rose. They should be planted in poor sandy soil, as then they ripen their wood, and flower abundantly.

WEIGELIA

is an attractive bush, Van Houttei being perhaps the best; the flowers large and rich in colour. For sunny shrubby borders nothing can be finer than Weigelas, and they are good for forcing in pots, blooming with great freedom when put in gentle heat. *J. S.*

FOENYTHIA VIRTIDISSIMA.

This shrub, which puts forth its blossoms in early spring some time before the leaves, is a good companion plant to *Ribes sanguineum*, and as a wall plant it excels. Its manner of growth is not shapely, yet with the aid of a stout stake in middle of the bush, and some judicious pruning directly after the flowers are over, presentable bushes may be obtained. *E. M.*

ENOCHORDA GRANDIFLORA.

This, the only one of the genus yet introduced to this country, is seldom seen in good condition, for the reason, perhaps, that it succeeds best when growing at the base of, and the shoots trained on, a wall facing south, the warmth thus secured ripening its growth and rendering it capable of producing its wreath-like sprays a foot or more long, of snow-white blossoms. Given a sunny spot in the open border it succeeds pretty well in southern districts, and here in Hampshire the flower-buds are at the point of opening. The addition of peat to loamy soil assists growth considerably. When trained on a wall the shoots which will flower should be allowed to hang loosely about, for if they are secured close to the wall not nearly so good an effect is produced, the flat flowers being in part hidden by the long leaves of a healthy plant. *E. M.* [The plant is sometimes named *Spiraea grandiflora*; another species, *E. serratifolia* is yet to be introduced from China. *En.*]

PTEROCARYA CAUCASICA.

This beautiful tree is well adapted for large gardens. The plant is somewhat similar to the Ash, but the foliage is larger; and, like that species, it requires a moist soil, as at Syon. Here the foliage is very fine when full grown, and towards autumn it assumes a lovely yellow tint. The finest specimen is enclosed with water on two sides, and its foliage is much finer than that of trees in drier positions. The long pendulous spikes of bloom have a charming effect. *Pterocarya* is a bush rather than a tree, although a vigorous specimen may be 30 to 40 feet high; the growth is dense and compact, and grows quickly when once established. Propagation is by seeds, but I have not raised plants of it from seeds because the trees near the water produce a large number of suckers, the roots of which are completely under the water, thus showing that the tree is at home near to water. These suckers, if taken

off in the winter and planted in a moist place, soon make trees for planting elsewhere. As to soil, a heavy loam suits it best, for if planted in light soil, the growth is less rapid, and the foliage poor. There are only three species of this tree, and for the above purpose this is the best I consider for planting in damp places. *Geo. Wythes, Syon House.* [The *Pterocarya*s are distinguished by their female flowers being in catkins, and the fruits furnished with two lateral wings, hence its name—"winged nut." Our correspondent mentions three species, but we believe there are, so far as is known, only two—the subject of the above note and *P. japonica*. Both are liable to have the young growth injured by spring frost, as is the common Walnut. *En.*]

MAGNOLIAS.

The free-flowering *Magnolia conspicua* has flowered beautifully and much earlier than usual this year at Syon, and the specimens are from 30 to 40 feet high, and cover a large space of wall that is sheltered from the north wind. This *Magnolia* and its varieties are beautiful objects in any garden, and do well along the Thames valley if protected on the north side. Last season there were only a few flowers on the plants, and these came much later. The blooms are fragrant (?) and very acceptable for any kind of decoration where white flowers are desired, such as in churches at the Easter season, which came at their blooming season this year. These *Magnolias* are well adapted for planting in sheltered corners. *M. conspicua Soulangiana* is a fine variety of *M. conspicua*, and its purple tinted double flowers exceed the first-named, and it is one that is now showing blooms liberally; *M. stellata* is a pretty dwarf plant that should be grown where the larger growing species would be too much exposed or out of place, but this one also should be protected on the north and east sides, as it is a slow-growing plant. *Magnolias* grow well in peaty soils, but peat is not absolutely necessary for them, as they do well in good turfy loam and leaf mould. They are rather difficult to establish, and some amount of care is required at planting and watering them during dry weather; the ground should be well drained, and means must be taken to prevent the young plants being wind-rocked. There are several desirable species which bloom later, as *M. acuminata* the cucumber tree, *M. nigra*, *M. purpurea*, and *M. tripartita*, the umbrella tree; *M. grandiflora* requires a wall, doing well on a south aspect; the *Exmouth* variety of *grandiflora* is one of the best. *M. glauca* and *M. obovata* requires much the same position as *M. stellata.* *Geo. Wythes, Syon House.*

PLANTS AND THEIR CULTURE.

GREENHOUSE HARDWOOD PLANTS.—The early-flowering plants in this house, which are now starting into growth, should be encouraged; the shoots of *Boronia*s, as the plants go out of bloom, should be shortened back to keep them a good shape, as the plants run up quickly. When the plants break, re-potting should be done, and the plants kept closer for a time, watering them sparingly. Many other species of plants of a similar habit of growth should be similarly treated. All will require shade for a short time after potting, and air should in all cases be admitted with care, and no cold currents allowed.

Erica Cavendishiana and others showing bloom should be afforded abundance of water, and some amount of shading during the brightest part of the day, so as to preserve the colour of the blooms. *Aphelaxis*, a very useful species when well grown, should by this time have been tied out, using as few sticks as possible for this purpose. *Pleurocnemus* need somewhat similar treatment, and are splendid plants that are not often seen in good condition.

Tetratheca, now in full beauty, will remain good for some time if shaded during bright sunshine—their beautiful purple-rose and violet flowers are very telling in this house. They need very few sticks, and are better if but few ties are used. These plants should never get placed where there are cold currents of air, or be watered excessively, or they

will soon die. When potting them, rather small pots should be used, and good fibrous peat, coarse silver sand, and abundance of clean crocks. The treatment advised for *Ericas* suits *Tetrabecca* throughout the winter months, but putting the plants at the warmest end of the house. *Eutaxias* are very pretty free blooming plants, which last some long time in bloom, and may be cultivated like the foregoing. The graceful growths are very effective if not tied in too much. *Chorizemas* will now be soon past their best, should have the decayed flowers removed, and the plants encouraged to make growth. *Chorizemas* are grand objects for the cool conservatory, and last in bloom for many weeks. I prefer to train them rather loosely to a few sticks, and regulate the shoots early in the year. If any require larger pots, the shifting should be done as soon as growth commences, employing a compost consisting of good peat and loam in equal proportions, with sharp silver-sand sufficient to keep the same porous and broken charcoal, the potting being firmly done; all excess of root-space should be avoided, or the soil soon gets into a sour state; it is a good plan to top-dress the plants, should there be any doubt as to their requiring potting. Another plant not difficult to grow, though seldom seen in gardens, is the graceful *Astus gracillimus* and *A. villosa*, both blooming profusely in the spring months. The culture applied to *Eutaxias* suits them; and the plants should be staged, so as to allow their pendulous shoots to be seen to advantage. The various species of *Metrosideros* (Bottle-brushes) are pretty New Holland plants rarely seen, and should be grown when space can be afforded them. I do not advise their cultivation in very small houses, but for large cool conservatories they are very effective. The same kinds of soil, temperature, and general treatment as are given to other hard-wooded plants of New Holland will grow them well. Most of them grow rather spreading, therefore they should occasionally get shortened in to keep them in shape.

Correas are splendid decorative subjects, and should be more commonly grown; they are plants of compact habit. The plants require great care in the small details of potting, watering, and keeping free of insects, and they grow freely when put into *Chorizema* compost. They are very impatient of over-watering, and too much pot room; and enjoy syringing during bright weather at closing time.

Eriostomus flower early in the spring months, and require much the same treatment as the other New Holland plants named. When wanted for later blooming they may be retarded by placing them in a north house, or under shelter from heavy rains in the open. When they have made their growth they should get a sunny, open position, sheltered from the east, to get the new wood ripened. *Eparis* should be growing freely, keeping them rather close to encourage new growth, and watering them with care. *Geo. Wythes, Spyn House, Beauford, W.*

THE ORCHID HOUSES.

THE COOL DIVISIONS.—Great care is needed to keep down aphid on *Odontoglossums* and *Mast-valias*, the syringe being the best implement to dislodge them, and no harm follows its use with rain-water—the position of the house being taken into consideration. If a lean-to house faces north or east, dewing the plants overhead in the morning, and well syringing all the stages, should be attended to; if it be a span-roofed house fully exposed to the sun, the plants will be the better for heavy syringings overhead night and morning, air being admitted at top and bottom by night and day. Robust plants of *Odontoglossum crispum*, which are sending up strong spikes, will be benefited by the application of weak liquid manure. I have a bucketful made by dissolving 1 oz. of guano in 1 gallon of water, and into this solution each plant is dipped once a week; I also use the same proportions for *Dissas* of the *grandiflora* and *racemosa* sections. The latter, now in flower, is a pretty plant, well worth the attention of anyone with a cool orchid-house. *Epidendrum vitulinum majus* is perhaps the best cool-house species; and its failure in the hands of some growers may be owing to their giving it too much warmth. Little or no fire-heat is likely to be required in this house until October, and if the temperature does not fall below 50° at night inside, none should be afforded it.

The Intermediate-House.—The prettiest plant in flower here, excepting the *Vandas*, is *Laelia majalis*.

It is a plant that should be more generally grown, it being one of the easiest culture. Growers who have been unsuccessful in flowering it should encourage growth by moisture and warmth for the next two or three months, and when the growths are quite matured the plants should be taken out of the warm house and treated in every way like a *Dendrobium* at rest.

Sophronitis grandiflora, *violacea*, and others, are now pushing their growth, and plants requiring new pans or baskets should now be attended to. A compost consisting of one-half peat and one-half sphagnum moss will suit them, but they must not be over done with either, as the roots like to twine around the pan or basket. Some growers grow these plants in the cool-house, but I have never found them to do so well under cool treatment as they do in this house.

Keep a good watch for red-spider on *Pleiones*, and dislodge any that may be seen, by the free use of the syringe. Manure-water may be afforded *Pleiones* as advised previously. The two best varieties are undoubtedly *P. malata* and *P. lagenaria*—the first is, perhaps, the best of the whole genus. The temperature of the intermediate-house may still remain as near as possible to that advised in the last Calendar. *A. G. Croft, Popham, Worcester.*

FRUITS UNDER GLASS.

VINES.—In the earliest houses, if the fruit is ripe, the air should be kept cool, otherwise black Grapes will at times change from blackness to a foxey hue. Evaporation being greater than hitherto, the borders will require larger supplies of water; and when the Grapes are gathered, liquid manure may be afforded them. If red-spider infests the foliage, and which would increase rapidly to the detriment of the Vines, the only safe method of ridding the foliage of spider at this stage is by syringing with water in which soft soap is dissolved. Treat pot-Vines intended for fruiting next season to liberal supplies of liquid manure previous to the ripening process, and stop the canes at a height of 6 feet, and all laterals and sub-laterals at the first joint.

Mission Vines.—*Madresfield Court* now showing, and near the colouring point, must not be hurried, as time is necessary for the laying on of that perfect finish that is the delight of the Grape cultivator. This, the finest of black varieties, being fleshy, and with a thin skin, requires, as the berries change colour, exceptional treatment, that the vexatious cracking of the berries may be averted. Cracking of the skin being in this case caused by atmospheric conditions, and it is generally found that the *Madresfield* cracks more in midseason and later houses than in the earlier houses, which may be explained by the fact that fire-heat is seldom used in the former, the houses being shut up to keep the temperature at its desired height, and a dense humid atmosphere follows, instead of a buoyant and light one at this critical period.

The following few simple rules, adopted in time and fairly carried out, are a sure preventive of the malady, viz. just before the first berry is expected to change colour, make sure that the borders are sufficiently watered to carry the Vines over the colouring period, and see that the strongest sub-laterals are stopped, and begin gradually to reduce the atmospheric moisture of the house. Regulate carefully, but never quite close the ventilators, maintaining the necessary temperature—69° to 70° by night, 75° to 85° by day, according to the weather outside—night and day by sun-heat or the hot-water pipes, and thus secure a buoyant atmosphere, which is conducive not only to the wholeness of the berries, but to their perfect colouring. See that the bunches of this variety are neatly supported at the shoulder, and the weight of the bunches has straightened them out to their full length, and give a final thinning of all seedless or misplaced berries. Keep the temperature of houses of *Muscot* or *Gros Colmar* Vines quite 62° or 72° night and day higher than those containing *Black Hamburgh*, or *Madresfield Court*, and close them early, with abundance of heat and moisture for a few hours, and then reduce the warmth by giving a small amount of front air for the evening. Attend to the stopping, thinning, training, and watering.

May is the best month for planting Vines; and if a vinery has been forced early, and the Grapes cut in May, there will be time to establish fruitful young canes, without the loss of a season, by planting

supernumerary ones for fruiting next year, alternately with the permanent ones. Borders 4 feet wide and 2 feet 6 inches deep are of ample proportions for a start. Beware of clayey loams, which turn almost to the consistency of clay when the grass roots decay; such soils require a large proportion of old mortar, broken charcoal, or charred earth, or half-inch crushed bones, and other animal substances which slowly decay. Do not add dung of any kind to the soil, but reserve this for mulching purposes. By all means secure perfect drainage, and when the soil has been trodden firmly, spread out the growing roots in shallow excavations. If a little fermentation takes place in the border, so much the better, or, failing that, a few barrow-loads of fermenting material may be built up against the tarfen wall of the borders.

Strawberry-house.—Regulate the supplies according to the demand; a number of British Queen may now be introduced. The season hitherto appears to have favoured Strawberry forcing, and I have never known fruit to be finer or more abundant, or of better flavour. The varieties *La Croix Sacree*, *Noble*, *President*, and *British Queen* coming into use in the order named, can be recommended. By the syringe vigorously daily, give the plants liquid manure, and transfer them to a dry warm shelf when near the ripening point. Plants done fruiting should be hardened off, preparatory to being partly shaken out and planted out *W. C. G. M., Madresfield Court, Malvern.*

THE KITCHEN GARDEN.

TREATMENT OF CELERY.—If the ground for the early main crop of Celery is at liberty, the trenches may be thrown out and prepared for the reception of the plants when ready. For the early crop the trenches, if to be planted in single rows, should not be less than 6 feet apart; but for the main crop, if in double rows, allow more space between the trenches. A deep trench is not to be recommended on heavy soils, and if the subsoil by such and consequently retentive of water, it should be broken up and partly replaced with soil from the surface. Put a layer of thoroughly decayed manure into the trench, cover it with a few inches of soil, and before planting, tread the soil if light, to induce starchy growth in the plants. French Beans, *Sprueh*, *L'Etoupe*, &c., or any plants which do not grow high, and which can be cleared off before out-lying time comes round, may be grown on the ridges.

Excellent Marrows and ridge Cucumbers should be hardened off as the plants become large enough, and if hand lights are obtainable, some of the plants may be put out; but unless there is some means of protection at hand the plants should not be put out until the end of the month. The best way to grow Marrows and Cucumbers is to dig out holes, 18 inches deep and 3 feet across at the bottom, and when two or three barrowfuls of warm dung, treading it in, and covering it with soil, and planting on the hills so formed. Treated in this way, the plants are short jointed and more prolific than in any other.

Cauliflower plants, as they become large enough, should be put out on deeply-dug manured soil. Brussels sprouts and other vegetables sown outside in March will now require pricking out, and should be attended to before they get crowded. Give the seed beds, facing heavy rain, a soaking of water two hours before disturbing the plants. Prick them out at a few inches apart, and further apart if the permanent quarters are not likely to be cleared before the plants get crowded; see that each sort is properly labelled, and water and slightly shade for a few hours during the hottest part of the day, till the plants recover from their removal.

Turnips and other seedlings peeping through the soil should be carefully watched, and if the fly (*Phylloxera nemorum*) attack them, dust them frequently with damp with soot, lime, and wood ashes.

Lettuces.—As they become fit, tie up the *Cos* variety when perfectly dry; plant out successions on firm rich ground in small breadths; and make frequent sowings. Turnips, Spinach, &c., will give better results on firm ground in hot dry weather, than on that that is loose; watering the drills before sowing.

Mustard and Cress, Radishes, &c., should now be sown on a partly shaded border, and moderately moist. Of the long kinds, *Wood Farm* is very good. *H. Markham, Mereworth Castle, Maidstone.*

EDITORIAL NOTICES.

Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are also solicited.

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

NEWSPAPERS. — Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOWS.

WEDNESDAY, MAY 14. Royal Botanic Society, Eastbourne.

MEETING.

TUESDAY, MAY 13. Royal Horticultural Society Floral, Fruit, and Scientific Committees, and Lecture.

SALES.

WEDNESDAY, MAY 14. Orchids in Flower and Bud, at Stevens' Rooms.

THURSDAY, MAY 15. Ferns, Greenhouse Plants, Roses in Pots, and Elms, at Protheroe & Morris' Rooms.

THURSDAY, MAY 15. Imported and Established Orchids, from Mr. E. Sander, at Stevens' Rooms.

FRIDAY, MAY 16. Imported and Established Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK. — 54.1.

Trees in their Spring Attire. At this season of the year we may realise more fully perhaps than at any other how deficient our ordinary text-books are in their descriptions of trees, and what feeble pictures, after all, they supply. The reason of course, is that for the most part the botanist sees the trees in one or two stages of their growth only, or is even often compelled to confine himself to the dried specimens in the herbarium. Moreover, so rapid is the growth at this time of the year, so fugitive the appearances presented, that unless the trees can be inspected on a particular day, some characteristics are lost till the next season. The gardener or the forester who is always on the spot, and who is, or who ought to be, always on the look out, has great advantages in these respects. A few illustrations may suffice to explain our meaning.

In Richmond Park there are two Horse Chestnuts side by side, now each in the full glory of their new leafage, and each covered with flower-buds promising an early display of bloom. The two trees are at this moment, to use a colloquialism, as like as two pins. The colour and stage of growth of the foliage and flower are, in fact, alike in both. Far otherwise was it a fortnight or so ago, when the buds were beginning to expand; then, the two trees were conspicuous a long way off, the one with its ruddy-brown colour forming a contrast to the other with its clear green hue. The explanation of the difference was easily found in the cir-

cumstance, that the expanding bud-scales of the one tree were tipped with deep brown, or even flushed with pink, while those on the other tree were mostly green.

Again, the leaf-scales or stipules of some of the Beech trees are of a lovely shade of crimson, while in others they are dull brown. It is, moreover, worthy of notice, that in the extension shoots, which lengthen rapidly, and which bear leaves only, these stipules are often most brilliantly coloured; whilst on the same tree, on the short, slow-growing "spurs" bearing the flowers, and where the internodes, as a botanist would say, are in consequence contracted, the colour of the stipular scales is dull brown. These differences make one wonder what purpose can be served by the brilliant coloration of organs whose functions would seem to be protective only, and which, once that office is fulfilled, fall off, and wither immediately. The colour in these stipules is presumably of the same nature as that which gives brilliancy to the leaves of the purple and copper Beeches. A similar colour is observable in the stipules of the Lime, but we have not yet met with any purple-leaved Lime tree.

The chemical analysis of the bud-scales, as determined by Professor CHURCH, is quite consonant with their temporary and merely protective character. They contain relatively much earthy mineral matter, but little or none of the organic compounds which are the accompaniments, and, indeed, the instruments of life and activity.

Another colour-phase is presented by the Hornbeam; when its male catkins are first produced slightly in advance of the leaves, when the whole tree is covered with a sheet of a pale olive or fawn-colour, quite unlike any other arborescent tint familiar to us, and one which rapidly changes as the leaves expand; notice also the peculiar olive tint of the Lombardy Poplar at this season.

Of the peculiarities presented by the developing buds of the Conifers we have spoken on previous occasions. It must suffice to say that they form objects of great beauty, interesting and suggestive subjects of investigation for the student, and often afford the forester means of distinguishing one species from another. Too implicit confidence, however, must not be placed on these characteristics, for, as we write, we have before us shoots of *Pinus cembra* taken from two plants growing side by side at Coombe Wood; in the one the bud-scales and shoots are pink, in the other green. Foresters and woodmen are familiar with many variations of this character which rarely come under the observation of the botanist, but which are often of practical importance, inasmuch as they are often associated with differences in the quality of the timber and the degree of hardihood of the tree.

The general course of leaf development varies somewhat according to season and individual peculiarity. This season, in the neighbourhood of London, the Sycamore, Horse Chestnut, Thorn, Hornbeam, Lime, and Birch have unfolded their leaves in the order named, whilst amongst the later trees may be mentioned Oak, Ash, Elm, Beech, Plane, and Sweet Chestnut.

The Microscopic Structure of Plants, and its Relation to Cultivation.

A VERY interesting discussion took place at the Paris Botanical Congress last August, and a report of which is now before us, on the employment of microscopical characters as an adjunct to classification. M. VESQUE, who introduced the subject,

was, we believe, perfectly right in insisting that the comparative study of the microscopical characters presented by plants should receive a due proportion of attention as other characters do. It does not follow that they are better or worse than others. We do not know at present what their precise value may be, whether they are as subject to variation as others; but their importance cannot be denied, and to allege that they are difficult and troublesome to investigate, though it may be true, is no argument against their intrinsic value. In so far as they are hereditary, and, therefore, relatively constant, they are known already to be valuable aids in discriminating the larger groups of plants, and what M. VESQUE and some other naturalists are anxious to do, is to extend the use of these characteristics to each natural family of plants, so far as circumstances permit. Any arrangement founded on these characters alone, would, of course, be just as unsatisfactory as any other artificial or incomplete system would be. We do not suppose that M. VESQUE has any intention of founding a system entirely on these characteristics. For classificatory purposes the congenital characters, more or less fixed by long hereditary transmission, are naturally preferable to those characters which are called "adaptive," because they vary according to circumstances. These are the characteristics, the possession of which enables a plant to sustain itself under new or adverse conditions; these are the endowments in the absence of which the plant cannot survive in the battle of life. Whether then, from the point of view of classification, of relative constancy, or from that of adaptation to varying conditions, the anatomical characters appear to be of the highest importance, and this is so obvious that it seems strange that any contrary opinion can be maintained. Such an opinion can only be entertained under a misapprehension.

But in these pages we are more directly concerned in the relation these characteristics bear to the cultural art. It is certain that many structural details are directly associated with variations in the conditions of life. The structure of a plant that passes its life in water is widely different from that of its near relative that grows on dry land. So intimate is the relation between the structure of a plant and the circumstances under which a plant grows naturally, that it is very often possible to recognise in a previously unknown plant the kind of life it must have been subjected to. Of course from our ignorance and limited knowledge, there are many exceptions and much that seems anomalous. But these facts form no valid argument for not availing ourselves as far as we can of what we do know, still less does it constitute a reason for not pushing our researches further in this direction. M. MAX CORNU, in discussing M. VESQUE's paper, seems to have objected to it as proposing a new system — a substitute for the natural system — but a perusal of M. VESQUE's writings leads to no such conclusion. All that M. VESQUE wishes to do, so far as we can make out, is to enlist anatomy in the work of perfecting the so-called natural system.

M. CORNU, too, also raises objections to the employment of anatomical characters as a guide to cultivators. M. VESQUE said that the anatomical structure [sometimes] clearly indicates the nature of the physical conditions to which the plant is adapted, and which must be realised as much as possible under cultivation. To this M. MAX CORNU objects, and says that we cannot in general realise what conditions would be necessary in the case of plants removed from their natural surroundings and placed under

CHRYSANTHEMUMS AT CHISWICK

other circumstances, to which they must adapt themselves or perish. Many of them live and prosper under the new conditions—conditions which are quite different from the natural ones. What information, asks M. COXET, could the study of structure give us, since different conditions give results superior to the normal ones? Coffee, says he, requires a rich (*forte*) soil in the tropics; it would perish here if grown in such a soil. The Nepenthes cannot, he says, be grown here except in an extremely porous substratum, while in Sumatra the soil in which the Nepenthes grows is a heavy impermeable loam.

In replying to M. COXET'S observations, M. VESQUE admitted his inability to reply to the two special cases—that of the Coffee and that of the Nepenthes, but stated that he was chiefly concerned with the relations of the structure to light and moisture, and doubted whether M. COXET would succeed in making a plant adapted to grow in the shade flourish in full sun, and *vice versa*; nor a plant adapted to a dry climate thrive in a moist one. In support of his argument, M. VESQUE called attention to the construction of plant-houses divided into separate compartments, allowing of variations of temperature and moisture. Anatomy often indicates what the treatment ought to be, or, inversely, in which compartment (*local*) we ought to place a plant.

Great difficulties stand in the way, no doubt; the application of a knowledge of anatomical structure to cultural purposes is in its merest infancy, but that it is destined in future to play an important part in practical horticulture, seems to us as absolutely certain as that a knowledge of the letters of the alphabet will, under given conditions, enable a gardener to read the *Gardeners' Chronicle*! It is not to be expected that practical gardeners can as a rule become expert microscopists, but they can profit by the skill of others, and it is the duty of those who have the power and the means at their disposal to hasten and foster the progress to the utmost of their ability.

CHRYSANTHEMUMS AT CHISWICK. In our Supplementary Sheet illustration this week we present to our readers a view of the conservatory at Chiswick during the successful gathering which took place there last autumn. The structure is a very suitable place for such displays, and looked quite gay at the Chrysanthemum Conference. Floral photography in November is surrounded by many difficulties which have been well overcome by Mr. W. MOUNTAIN, of 211, Clapham Road, S.W., who took the view from which our supplement has been prepared.

THE "BOTANICAL MAGAZINE."—The May number contains coloured illustrations of—*Eucnemis curvicauda*, t. 7113, a tall-growing Asphodel from Afghanistan. According to Dr. ARTHURSON, it grows at an elevation of from 7000 to 8000 feet, and the young leaves are used as a vegetable. The linear leaves are a 1 foot long, surrounding a flower-stalk which is twice as long, and bears at its summit a dense many-flowered spike of star-like yellow flowers.

Abies brachyphylla, t. 7111. One of the handsomest of the newly introduced Silver Firs, native of Japan, and figured in these columns, 1879.

Passiflora Miersii, t. 7115.—A very graceful Brazilian Passion-flower, figured in these columns in 1888, vol. ii., p. 352, fig. 16.

Berberis viridescens, t. 7116.—A species nearly allied to *B. aristata*.

Prinandrea sinensis, t. 7117.—A curious Chinese plant, with the habit and foliage of a *Primula*, but the construction of whose flowers shows it to be a *Germerid* (see *Gardeners' Chronicle*, 1889, vol. ii., p. 357, fig. 52).

LONDON PURPLE.—A safe and effectual remedy against the destructive ravages of insects on our fruit trees in the garden, and especially in the orchard, is of great advantage in these days of extending fruit culture. And as we have many enquiries concerning London Purple, an article hitherto found difficult to purchase, but one that is found most effectual as an insecticide in the United States of America, we publish with pleasure the following letter from HEMINGWAY'S "London Purple" Company, Limited, 69, Mark Lane, London, E.C.

"We are inundated with enquiries from all parts of England for our 'London Purple,' an insecticide for leaf-eating insects, which has during the past twelve years become of great repute in America and the colonies. This effectually dispels the doubts we have hitherto entertained as to whether insect pests in England were sufficiently numerous to render it essential that the fruit grower should combat them. We are still, however, unwilling to place our product unreservedly on the English market, because our long experience teaches us that many persons when they first use 'London Purple' look on it in the light of an insurance, expecting it to work like a charm without the expenditure of any care or labour; whereas the war against insect life demands the exercise of both of these; the attack must be commenced and repeated before any visible harm is done by the insects to the trees, with the object of killing the grub immediately it leaves the egg. Again, many think that if a little does good, much will do more good, and 'London Purple' is blamed if no benefit, or if positive harm results from not implicitly following the instructions which accompany each package or bottle.

"Bearing all this in mind and deeming it most important that 'London Purple' should be first placed in the hands of intelligent people, before the ordinary labourer is entrusted with it, we have decided to supply a quantity of it gratuitously, during the present year, to any approved fruit grower who will apply to us for the same."

THE ROYAL NATIONAL TULIP SOCIETY. The meeting of growers and exhibitors of the Tulip, which took place at Manchester on the 3rd inst., decided that the annual exhibition should be held at the Botanical Gardens, Old Trafford, on Wednesday, May 28, being the last day of the great Whitsun Show. So far, the general opinion points to an early bloom, but much will, of course, depend upon the weather experienced during the next fortnight. The Rev. E. D. HOBBS, whose bloom is generally early, though he resides so far north, and Mr. JAMES THURSTON, of Cardiff, in the distant west, both state they will be at their best by the 22nd inst., and consequently can scarcely expect to show at Manchester. Still, the prospects of a good exhibition are bright and promising.

EXHIBITION AT MONT ST. AMAND.—At this exhibition, held recently, M. AUGUST GERT showed a fine collection of Palms, including *Areca Baueri*, the variegated form of *Rhapis flabelliformis*, *Phoenix canariensis*. M. VAN LINSCHOT showed a collection of Orchids, comprising 250 specimens, including *Miltonia vexillaria*, with six fine spikes of deeply coloured flowers from two pseudobulbs; *M. Warscewiczii*, *Trichopilia crispata marginata*, a fine variety of *Cattleya Mendellii*, with white segments and deeply coloured lip; *Dendrobium Jaunesianum*, *Oncidium phymatocheilum*, with a spike bearing a hundred flowers; a superb *Oulotoglossum cirrosum*, *Brassia maculata*, *Phaius Wallichii*, *Bletia Gebina*, *Celoglyne Massangana*, *Laelia harpophylla*. M. DE SAER DUVIVIER showed a group of well cultivated miscellaneous plants, such as various *Ericas*, *Posoquerias multiflora*, *Eriostemon nerifolium*, *Xanthoqueras sorbifolia*, and a fine plant of *Boronia heterophylla*. Among new plants *Nidularium argenteum striatum*, *Epiphyllum Makoyanum*, *Vriesea Moensis*, a plant with broad leaves of a shining green, with a central stripe of gold; *Philodendron Mocini*,

Azalea Fr. Desbois with large double violet coloured flowers of good shape; *Azalea Pearl of Ledeb.* with white flowers, striped with red. Among plants remarkable for their high cultivation were *Strelitzia reginae*, *Medimilla magnifica*, *Polygala Dalmaisiana*, and a unique example of *Washingtonia robusta*. A *Miltonia vexillaria*, from M. PACWEI'S, had the petals spotted with large pure white spots, which produced a singular effect. Among M. VERVET'S plants was a fine *Cyathea dealbata*. *Ch. D. B.*

FRUIT PESTS.—We are glad to see from the *Evesham Standard* that on Lord SCOTLEY'S farm at Toddington, experiments have been made with Paris Green, London Purple, and other insecticides. It is disheartening to have to record so constantly what Americans and Frenchmen are doing, while we seem to lag behind. At Toddington, however, things are different; insecticides and spray-distributors are tried at once, and the sleepy hollow system is discontinued. Captain COMBETT reports favourably of Paris Green in the proportion of 1 oz. to 10 gallons of water, the mixture being constantly stirred. London Purple was not so satisfactory, but the experiments, as a whole, were "exceedingly satisfactory." An important question yet to be decided is as to the propriety of applying the mixture to the flowers when expanded, but the American practice, as we have pointed out, is never to do so when the trees are in flower. Moreover, where grass is grown in orchards care should be taken not to pasture the sheep in them for some time after the application. Apple foliage is more tender than that of Plums. A solution of alum in the proportion of 2 oz. to 1 gal. of water has proved destructive to the caterpillars, while the foliage was unharmed. If this be so, the use of alum would be preferable, as avoiding the risks of arsenical poisoning from Paris Green or London Purple. As a final result of the meeting at Evesham, it was decided to recommend the use of Paris Green paste in the proportion of 1 oz. to 8 or 10 gal. of water for Plums, and 1 oz. to 20 gal. of water for Apples. London fluid 1 part to 20 parts. Both these are recommended as effective in destroying the caterpillar, while they do no material damage to the foliage.

HORTICULTURAL CLUB.—The subject announced for discussion at the forthcoming meeting on May 13, is "Common sense and common nonsense in the naming of plants." The discussion will be opened by Mr. SAMUEL HUBBARD.

HYBRID BETWEEN THE GOOSEBERRY AND THE BLACK CURRANT.—Mr. CULVEWELL sends us specimens of this cross, as he has done on previous occasions. The leaves are like those of the Gooseberry, while the flowers are more like those of the Currant. The ovules are well formed, but the pollen is deficient.

THE CAMELLIA AT THE DELL.—It appears that, contrary to what was stated in a previous issue, this fine shrub is protected by a frame of timber supporting a glass roof during the winter.

DECORATIVE FERNS AT MR. JAMES NAYLOR'S.—The market growers of Ferns, limited as to varieties, have advantages over the gardener who grows a collection of many species, but even among the first-named, some are more successful in getting size and beauty of frond, in proportion to the pots used, than others. It would be difficult to find anything better in that way than may be observed in the long span-houses at St. Hilda's Nursery, Roxeth, Harrow, where the varieties principally grown are forms of *Pteris serrulata*, and especially that one known and certificated by the Royal Horticultural Society as Naylor's crested, a houseful of which will average 2 feet in diameter, and beautifully crested, the creasing in the progeny of the original stock increasing in amplitude with each raising. *Pteris tremula filiosa* is another fine introduction here, and for future novelties there are elegantly drooping and crested forms of the favourite market Fern,

Aspidium (*Cyrtomium*) *falcatum*, *Tolea arborea*, *Lastrea erythrospora*, *Pteris adiantoides*, *Lomaria discolor bipinnatifida*, and other species not generally in cultivation, which are readily raised and developed in a short time.

TUNBRIDGE WELLS.—The horticultural Society of this town will hold, on July 9 next, its thirty-second yearly show; and if plenty of prize-money can induce exhibitors to come forward, it should be a success from the promoter's point of view. The sum of £180 will be awarded in prizes.

TULIP W. E. GLADSTONE.—A very large, bright Tulip, is sent us by Messrs. BARR & SONS, Covent Garden. The flower, which with almost erect petals, measures 4 inches in diameter, has strong resemblance to the single flower rosy-crimson flamed Tulip *Proserpine*, but is larger and more robust. Growing to the same height as *Pottebakker*, it would make a showy bed; and it forces well.

"NEW MODEL" LAWN MOWER.—Our attention has been called to this machine, which may be safely recommended for its lightness of draft. Amateurs will also be glad to know of a machine in which the mechanical parts are not complicated, the bearings when taken apart cannot possibly be put together wrongly, and the adjustment of the knives—an important matter—is perfectly simple. The mower is introduced by the Chadborn and Coldwell Manufacturing Co., whose Excelsior machines are already well known; indeed, the "New Model" may be described as a cheaper form of that machine.

CAPTAIN STRAWBERRY.—This, which is a Strawberry of Mr. LAXTON'S raising, is highly spoken of by Mr. BLACKMORE. It has a vigorous constitution, is prolific, and the fruit is both large and of a good flavour, and comes into bearing a little earlier than the general outdoor crop, and has a tendency to produce a second crop of fruits in the late autumn.

THE MARKET GARDENERS' STRIKE.—Probably from the lack of funds and of organisation, this ill-advised proceeding shows signs of collapse. The low rate of pay (2s. 7d. an hour), and the inevitable uncertainty of employment at certain seasons, render the condition of the labourers by no means enviable. The men, however, seem to have placed themselves in the wrong by the suddenness of their proceedings; but it is to be hoped that pacific counsels may prevail on both sides, and that, taught by experience, more satisfactory arrangements may in future be made. The *Thames Valley Times* contains the following account of the proceedings at the meeting of the employers held on the 6th inst.:

"The masters in and around this neighbourhood held a meeting at Covent Garden, on Saturday, with the result announced in the communication appended below. As to the amount of loss and inconvenience inflicted upon them by the strike, this appears to vary very much with the nature of their crops, some of these requiring very little care at this season, while others, notably Asparagus, suffer much from lack of attention.

"28, Wellington Street, Strand, W.C.

"May 6th, 1890.

"Sir,—In reference to the recent strike of market garden hands, a meeting of market gardeners, representing the counties of Middlesex, Surrey, Kent, Essex and Bucks, was held in Covent Garden Market on Saturday morning last. While sympathising in a large measure with the desire of the men, the meeting was unanimous in declaring that the present circumstances of the trade would not warrant any increase upon the wages already paid. The meeting also, by resolution, protested against the manner in which the strike had been commenced, no notice having been given or any formal demand made to the masters, but suddenly, in the middle of the day,

many men left their work, in response to the shouts of a mob apparently numbering only a very few market garden hands among it. Many employers reported that their men were perfectly content, and only went out because, as they said, 'they were afraid of getting their heads broke.' I am glad to say that now most of the men are reported to have returned to work.—I am, Sir, yours obediently,

"Richard J. SREEL,
"Secretary, Market Gardens' Nurserymen,
and Farmers' Association."

JAMES NASMYTH.—The inventor of the steam hammer, whose death on the 7th inst., in his eighty-second year is announced, was not only a great engineer, but solaced his leisure in his later years with astronomical pursuits; while his autobiography, published in 1883, contains many references to the delight he took in his beautiful garden, Hammerfield, near Panshurst, an account of which will be found in our issue for September 1, 1883.

RATING OF ORCHARDS.—The inclusion of orchards within an exemption relative to rating is proposed in a Bill introduced by Mr. HOBHOUSE, M.P. Under the Public Health Act, the occupier of any "land used as arable, meadow, or pasture ground only, or as woodlands, market gardens, or nursery grounds," is directed to be assessed to the general district rate in an urban district, or to a separate rate in a rural district, in the proportion of a fourth part only of the net annual value or rateable value of the land. It appears that some doubts have arisen whether orchards are included among the lands so privileged. To remove the doubt, and "to relieve orchards from all liability to be assessed for sanitary purposes at a higher rate than other cultivated lands," it is proposed to expressly insert the word "orchards" in the exempting clause.

A NEW SEED DRILL.—We have received from Messrs. BOULTON & PAUL, Norwich, an implement for sowing garden seeds, which promises to be of much use in putting into the soil such seeds of vegetables as it is usual to sow in drills. As at present constructed, it is better adapted for light work, and those seeds that require to be put at depths varying from half an inch to 2 inches. For Peas and Kidney Beans, the drills the implement is capable of forming are too shallow. The arrangement for the emission of seeds can be regulated to a nicety to suit the different sizes of the same.

THE GREAT AFRICAN FOREST.—The two principal topics touched upon by Mr. STANLEY at the Albert Hall were the "pygmies" and the great forest. The former, though considered an aboriginal race, are, as things go, evidently considerably advanced in civilisation. As to the forest, its monotonous gloom seems to have made a greater impression than anything else, but when we remember what remarkable discoveries were made in similar regions by WELWITSCH, whose name as an explorer stands not far below that of STANLEY himself, it is obvious that to a naturalist these forests must be teeming with interest. Now that STANLEY has shown that these forests are not impenetrable, we may soon expect our VILBURNES, BULLS, SANDERS, and other importers to furnish us with "new plants" of unusual variety and interest. What Ferns, what Palms, what Orchids, what Aroids there must be in these truly primeval forests! Mr. STANLEY'S account is picturesque and graphic, but it leaves the impression that much remains to be said. Let us hope that some of the party managed to secure illustrations of the botany of the region.

LINNEAN SOCIETY.—At the meeting held on May 1, Mr. J. G. BAKER, F.R.S., Vice-President, in the chair. The Rev. J. TAIT SCOTT was admitted, and Messrs. J. H. GARRETT and JOHN YOUNG were elected Fellows, Dr. E. von ROEHL, of St. Petersburg, and Mr. SHERNO WATSON, of Harvard University, Cambridge, Mass., being elected foreign members,

Mr. MILLER CHRISTY exhibited, and made remarks, on specimens of the so-called Bardfield Oxlip, which he had found growing abundantly, not only in the neighbourhood of Bardfield, Essex, but over a considerable area to the north and west of it. Mr. BUCHAN exhibited, under the microscope, specimens of *Myricitrichia claviformis* with plurilocular sporangia and conjugation of *Rhabdomena arcticatum*, found upon *Zostera maritima*. Mr. SHERMAN exhibited a series of excellent photographs which he had taken near Falmouth, and which showed the effects of climatic influence on the growth of several sub-tropical and rare plants cultivated in the open air. A paper was then read by Professor W. FRANK, "On a Quantitative Examination of Water-meadow Herbage."

ARRANGING PLANTS FOR THE HERBARIUM.—Mr. F. BENNETT sends us the following account of his method of drying plants, which first appeared in the columns of the *Beecher*:

"An examination of a good many herbaria shows that botanists, as a rule, are somewhat careless in the laying-out of their plants as they dry. It often looks as if they had thrust them between the sheets ' anyhow,' and the result is very detrimental to the appearance and perhaps to the value of the specimens. It having been my object to obtain really good and artistic arrangements of leaves and flowers in dried plants, I have devised a plan which I venture to commend to the notice of botanists.

"Many plants, it is true, can be placed smoothly between the sheets without any such help, but there are many which are so refractory that while one is putting one leaf in position, that which was last arranged has gone astray again. In such cases, and they certainly are the majority, the simple apparatus now to be described will be found completely successful. It consists of a flat board, a few sheets of drying-paper, and a roller, round which is rolled a piece of lead-paper, or thin sheet-lead, rather longer than the board.

"To use this, place a few sheets of paper on the board, and unrolling the lead a little, bend the edge of it over the upper end of the board, so as to fix it there. Now roll up the lead till the roller is at the upper end of the drying-paper. Next place your plant between the sheets, bending the upper sheet back over the roller. You can now use all your fingers in arranging the various parts of the specimen, and by gradually lowering the roller the lead-paper will, as it unfolds, keep everything in position. The lead-paper is lastly bent over the lower end of the board, and the whole is ready to be pressed.

"The thin lead can be procured from a tea-dealer, who will probably present it gratis. It may require a little smoothing out when thus obtained, but a small amount of crinkling will be rather beneficial than the contrary. After twenty-four hours or so the plant thus arranged will retain its position, and the sheets of paper can be changed."

FOREIGN CORRESPONDENCE.

BERLIN LETTER.

As you have already mentioned, the Berlin Horticultural Exhibition has been a great success. Although it was not intended to be an international one, exhibitors from other countries sent excellent contributions, and with much credit to themselves. Mr. Sander, of St. Albans, won the special prize offered by the Duke of Ratibor—a fine piece of gold plate—for his group of *Dendrobium Brymerianum*; Mr. A. Peeters, of Brussels, was awarded the £25 offered by the town of Berlin for *Azalea indica*; and Mr. D'Haene, of Ghent, received £30 for fine and extensive saloon decorations, &c. A general plan of the arrangement of the exhibition was given in a former issue of the *Gardeners' Chronicle* (February 1, 1890). One hall to the left was unique, having been arranged

as a representation of the tent of King Ptolemæus Philadelphus, as prepared for the festivities of Dionysius on the Royal Castle at Alexandria about 270 B.C. The description of this tent is given by Athenæus in vol. v. of his *Deipnosophistæ*, which relates that the four corner pillars were like Palm trees. The floor was of rich carpet, and strewn with flowers, and the other parts of the building too, that it was like an enchanted garden. The left wall was painted to represent a view of the Bay of Alexandria. The floral decorations were entrusted to Mr. D'Haene, of Ghent, who had some finely-flowered *Azalea indica* (?). The background was decorated by the finest Palms, in good condition, as well as by other exotic plants. Large plants of *Anthurium Veitchii*, 5 feet high and more, were intermixed.

The centre portion of the Exhibition-hall was devoted to garden-architecture. The first thing seen was a winter garden. A large (but curious) Flora sat in the midst, surrounding the statue is a large bed, with *Selaginella Kraussiana* as a ground plant, and quite hid the soil. Groups of *Caladium*, of *Primula obovata* (very fine plants), three dwarf *Thuja obtusa brevifolia*, of Japanese growth, and which had only grown to a height of 2 feet in 150 years, were relieved by fine-leaved *Dracenas*. The walls were decorated by large groups of Palms, Crotons, &c. A nice *Cyanophyllum magnificum* took the admiration of the public. Two walls were formed by large mirrors, which enhanced the effect.

In the large central hall on both right and left were villas with balconies and pagodas, which displayed window decorations, verandah festoons, &c. Then to the left was an entrance to a castle with a large wing, and to the left again a large courtyard all decorated with large groups of Palms and Cycads from Mr. Vincke, Du Jardin of Brussels. Then there were house-fronts with balconies, and a flight of steps leading up to a balcony, from which you had a magnificent view of this hall.

The number of Palms in this large hall were immense, and all in the best condition. In the centre of the hall were three large beds, composed of groups of different plants. In the first, a large group of *Cyclamen persicum* from Mr. Schmarwitz, of Potsdam, of high merit for the season; then groups of the Lily of the Valley, groups of *Bromeliads*, of *Anthurium Scherzerianum* varieties in full flower, a little group of the curious *Arum sanctum*, the "black Calla," *Araucaria excelsa* varieties from Mr. Vincke, a group of *Lomaria Gibba*, fine *Aralias*, a large group of *Dracenas* in the best of condition as well as other collections. The next hall was entirely devoted to decorative groups of Palms, &c. Then came a hall containing forced flowering shrubs, and another decoration hall. The end formed a large winter-garden covered by a fine awning, and some interest attached to the right and left-hand corners of this hall, which were representations of the winter-garden of the late Emperor William I., and were furnished with the identical plants. The outer rows of the palace were filled with flowers, the right one with *Roses* of much magnificence; while the left one contained *Orchids*, *Palms*, *Ferns*, and *Aroids*, in short, the fine warm-house plants, and a large group of flowering *Azalea indica* from Mr. Peters, specimens of 2 and 3 feet in diameter. The rows between the outer and middle one contained decorative groups of Palms of Mr. d'Haene, *Rhododendron* groups, and the arrangements of cut flowers. In the rows and halls which connected the middle row with the outer ones, were dried *Orchids*, &c., for the decoration of the mansions.

But large as the Exhibition Palace is, it did not suffice for all the plants, and many were placed in the different houses. One was filled by the *Orchids* of Mr. Vincke; another contained *Cacti* and *Bromeliads*; third *Cinerarias*; a fourth *Begonias*; a fifth *Cacti*.

Vegetables, fruits, and fruit wines, were placed in the large "Machine Hall." Here *Gooseberries*, *Currants*, *Strawberries*, *Grapes*, *Beans*, *Cucumbers*, &c., attracted admiration. The Italian vegetables, from Messrs. Dammann & Co., were wonderful.

In the park were coniferous plants—indeed, the finest and largest collection ever seen in Berlin.

Over 117,000 persons paid for admission during the first week of the show, which has evidently pleased the public. In my next letter I shall give more details of certain prominent plants and groups. *Our Berlin Correspondent*.

STRIKE OF THE MARKET GARDENERS.

ALMOST all of the men usually employed in the market gardens of Chiswick, Kew, Richmond, and neighbouring districts have gone out on strike during the past week for better pay and shorter hours. The remarks which follow are condensed from the *Richmond* and *Twickenham Times*. What the labourers ask is an increase of wage of from 3*l.* or 4*l.*, as the case may be, to 4*l.* an hour all round; 6*l.* an hour overtime, after ten hours' work; and a cessation of work at four o'clock on Saturday afternoon. Some attempts were made by the Surrey strikers on Monday and Tuesday to induce Middlesex men to join them, but without much effect. On Wednesday, however, an organised campaign was made into the county by the mass of those who had come out in Surrey, and lasted all day.

A Mr. Tocatti, of Hammersmith, a prominent social democrat, came down to take charge of, and give some sort of rough organisation to, the movement, the market garden labourers having as yet no sort of union of their own. Business commenced at 10 o'clock with a meeting by the drinking fountain at the end of Kew Bridge, where Mr. Tocatti expounded their demands, and preached unity, firmness, and order. This gentleman is not a polished speaker, but, on the whole, he put the case for and to the strikers with a fair display of moderation and good sense. He then led them along the High road to the gardens and orchards of Mr. Taylor and Mr. Jefferys. Here a very lively scene took place. A force of police, consisting of two mounted constables, and more than a score on foot, composed of drafts from the Richmond, Brentford, and Chiswick districts, was following and mixing closely with the crowd. When the latter surged up to the hedges, and shouted long and vigorously to the few men who could be seen working inside to "come out," the police took measures to drive them back into the roadway. These, however, were only partially successful; and in response to the calls of the strikers, several hands inside did come out, whereas the crowd was much elated. Turning down to Mr. Jefferys' farm buildings, several of those in the crowd endeavoured to go inside, on the plea that they had money to draw for work done previous to leaving. The police would not allow them inside, but Mr. Tocatti was passed through their lines, and conversed with Mr. Jefferys, who was watching the crowd from the yard. Very curious it was to notice the irresolution of a big, white-jacketed labourer, who had been working, and who was earnestly besought by the crowd to "come out." He came to the gate, went back and talked with Mr. Jefferys, came forward again, and again went back to his employer. Then he came out, and said that he had personally been offered all he wanted in the way of wages if he would remain; why should he come out? Several strikers thereupon declared that they also had been getting good wages, and had only come out to help their brothers who were not. White jacket went inside again. "Shame on you." "Are you going to be a blackleg?" and other expressive remarks were shouted after him. But the tone of these quickly changed when it was seen that he had only returned to fetch his can and other traps, and as he came out, with another worker, he received quite an ovation. Some more men who had been working subsequently came over the railway bridge, and joined the ranks of the discontented. The crowd partially scattered shortly after noon, no doubt in search of refreshments, but re-assembled in force in an hour or two opposite Mr. Steele's gardens. Meanwhile the Richmond police had been sent away, and their places filled by more

blue-coats, including three mounted men, from Acton and Ealing. The demonstration up and down the roads opposite Mr. Steele's grounds was a prolonged one. Mr. Tocatti again addressed the men here. They had won, he said, all along the line, and they were determined not to rest until they had got out all the market garden employes in the district. In a day or two they would have them all out. It was not true that they were half-drunk that day. From Mr. Steele's the greater part of the crowd marched down to South Acton, and along the footpaths below the station. Here the cavalry detachment of the police had to leave them for a while, taking their chance of picking them up again wherever they might come out. In a field of Mr. Jefferys', close to the station, four men were at work spreading lime. The strikers swarmed up the high fence, others taking up effective cogns of vantage on the station steps, and again the hoarse and almost fierce cry of "Come out!" ran from a hundred throats with varying additions of appeal dictated by individual taste and fancy. The four inside straightened their backs, and for two minutes stood motionless almost as statues, looking at the shouting crowd and taking council of one another. Then in slow bacolic fashion they shouldered their forks and marched in a slow moving line of white jackets from the field. The men outside cheered wildly, and hurried round to the gates, half a mile away, to meet them. After this they went down by the Back Common to Turnham Green, picking up the mounted men again *en route*, and so on to Gunnersbury Station. Here one or two men working in Mr. Day's fields by the line were more obstinate, and a vigorous wordy warfare ensued without much avail. It was now nearly six o'clock, and the crowd, marching back to the bridge, dispersed.

Throughout the day the police force, which was under the command of Inspector Rawlings, of Chiswick, operated with much tact and without any display of animosity. The behaviour of the strikers themselves was also, considering the class to which they belong, and the excitement under which they were labouring, conspicuously moderate. No threats were heard to be used at any time to non-striking workers, beyond such vague expressions as "If you don't come out to-day you'll have to to-morrow," and "We'll make it warm for you if you don't."

On Thursday morning the strikers were early about in various directions. A large party of them went down to Isleworth, and succeeded in inducing some of the men at gardens owned by Mr. Norris, and other gardeners in that direction to join them. At 10 o'clock they met in force at Ravenscourt Park, and were there joined by the men who had been working at Lovejoy's. An attempt to bring out a large gang of men who were working in Robbins' grounds was not successful. Then the strikers straggled—for they were not allowed to "proceed" through Barnes, Putney, and Fulham, and a number of them finally found their way in small groups to Hyde Park, there to take part in the international demonstration.

WHAT THE EMPLOYERS SAY.

Mr. W. Barker, market gardener, of Sheen, writes, through Mr. Albridge:—

"Mr. Barker has not risen his workmen from 12*s.* to 1*l.* a week, but is paying them exactly the same as he has done for some years, viz., 2*l.* an hour, or 12*s.* 6*d.* a week of ten hours a day; and then it must not be overlooked that these women do not get any piece work, whilst those working in other market gardens in the district sometimes earn from 15*s.* to 20*s.* a week during the *Rudish* and *Gooseberry* seasons. . . . Mr. Barker denies that he informed the strikers that the other master gardeners in the district could well afford to pay the same rate of wages as himself if they chose. In a great measure his business is very different to others in this district, seeing that he only employs men in his gardens in the few summer months, and not in the winter, when work is scarce, because he does not grow winter produce, such as *Celery*, *Seakale*, *Mushrooms*, &c., and

for this reason he considers he ought to pay more wages than those who do employ their men all the year round. The masters will be quite willing to pay fair wages for a fair day's work, but in these days of keen competition—with the foreigner as well as in our own land—it is scarcely likely that all the demands of the men can be agreed to, unless they are able to remain out for a considerable time, for in some cases the men not only demand 2s. 6d. a week rise, but 6d. an hour overtime, and to leave work at 4 o'clock on Saturday and be paid for a full day. If they will modify some of these demands and bring them within reason, I will give them all the support I can."

In an interview with our representative yesterday morning, Mr. J. Poupart said that none of his men had come back, and that if they did he would not allow them to go to work again. The women had not gone out, and with their aid he could get along for the present very well. He did not believe that employers could possibly afford to pay a general wage of 4s. an hour. Even if they formed a union themselves, and raised wages all round, London would not pay a better price for their produce.

THE STRIKERS AT ISLEWORTH.

On Friday afternoon a body of strikers visited Isleworth, and a short address was delivered by Mr. James Tocatti, of Hammersmith, who headed the men. Afterwards the men proceeded to various market gardeners in the district, choosing a route

FIG. 95.—LEE'S PATENT FRAME.

FIG. 96.—THE FRAME BLOCK.

up the Worton Road on to Whitton, and returning through Twickenham to Isleworth. The men at work in the fields were summoned by the strikers to cease work, and at several places many of the men complied. Two mounted policemen and two or three on foot went with the men, to see that no trespass was made and no violence attempted. The men, however, numbering some 200, were perfectly orderly, and gave no occasion for police interference. It is stated that some 600 men have come out as the result of the efforts of the leaders of the movement. The men claim to have persuaded their fellows employed at the following places to come out:—Mr. Besant, Barnes; Mr. G. Pink, Mortlake; Miss Besant, Mortlake; Mr. J. Pocock, jun., Mortlake; Mr. J. Pocock, sen., Mortlake; Mr. E. Pocock, East Sheen; Mr. J. T. Taylor, Kew; Mr. G. Jeffreys, Gunnersbury; Mr. T. Day, Gunnersbury; Mr. C. Steele, Gunnersbury; Mr. C. Steele, Ealing; Mr. C. Lee, Ealing; Mr. J. T. Taylor, Brentford Bridge; Mr. Daws, Gunnersbury; Mr. Robbins, Chiswick; Mr. Moore, Sion Hill; Mr. Poupart, Twickenham; and Mr. Warren, Isleworth. *Richmond and Twickenham Times, May 3.*

THE APIARY.

PREPARATIONS FOR THE SEASON.

It is not done before, preparations must at once be made for the coming season. The best plan is to think beforehand what you will do, and then do it. Brood rearing is now going on quickly, and strong hives are getting very full of bees. To get the best results, if you have good frames of comb, make use

of them as you require them; but if not, the next best thing is undoubtedly full sheets of foundation. There are many good ones in the market, and it seems difficult to choose. We here represent an excellent one.

Lee's Patent Frame (fig. 95, for the use of which we are indebted to Messrs. Neighbor) is an excellent frame, with a full sheet of foundation hanging in it. The top bar is split all the way along, and so is the bottom bar, and the metal frame ends hold the foundation in its place. To realise the full benefit of this system, you ought to possess a frame-block.

The frame-block (fig. 96) is laid in the recess prepared to receive the four separate parts; then a sheet of brood foundation has to be carefully laid flat on the block, after which follows the other half top rail, which is driven home with a light hammer. The bottom rails are not quite closed, to allow the foundation to hang loosely for expansion. The bees fasten the foundation very firmly into these frames, and the combs will not break if the extractor is used with care. When filled with honey they are heavy, sometimes weighing 7 or even 8 lb. each, though 6 lb. might be called a very good average. If the bees are brought up to a good strength by the time Apple blossoms are out, some of these frames could be placed in a box on top of the hive, and if suitable weather followed, would be filled with amazing rapidity. Section boxes and sections must also be got ready at once. Some people get sections from one hive and extracted honey from another, but if the season is carefully studied and the bees are strong in numbers, it is quite possible, by judicious

the evidence and conclusions of others published within the last few years were revised.

It was considered that the earlier results obtained by Boussingault and at Rothamsted under conditions in which the action both of electricity and of microbes was excluded, were conclusive against the supposition that the higher chlorophyllous plants can directly fix the free nitrogen of the atmosphere, either by their leaves or otherwise.

It was pointed out how large was the store of already existing combined nitrogen in many soils and subsoils, and evidence was adduced to show that even Leguminosae derive a considerable amount of nitrogen from nitric acid within the soil; and, further, that it was, as a rule, those having the most powerful root-development that took up the most nitrogen from somewhere, which was considered to be of a subsoil source; and it was concluded that, at any rate, in the case of our graniferous, cruciferous, chenopodiaceous, and our solanaceous crops, atmospheric nitrogen was not the source. It was admitted, however, that existing evidence was insufficient to explain the source of the whole of the nitrogen of the Leguminosae.

According to some of the more recent experiments, the fixation of free nitrogen is not limited to our Leguminous crops; and the modes of explanation of the gains of nitrogen observed are extremely various.

Thus, it is assumed, that combined nitrogen has been absorbed from the air, either by the soil or by the plant, that there is fixation of free nitrogen within the soil by the agency of porous and alkaline

supering, to obtain both extracted honey and sections from one and the same hive. Motto, 'Be up and doing.' Bee.

THE FIXING OF FREE NITROGEN BY PLANTS.

The fundamental importance of the question, that although the higher green-leaved or chlorophyllous plants may not directly utilise the nitrogen of the air, some of them, at any rate, may acquire nitrogen brought into combination under the influence of lower organisms, and the development of which is, apparently, in some cases, a coincident of the growth of the higher plant whose nutrition they are to serve, decided Sir J. B. Lawes, Bart., and Professor J. H. Gilbert, LL.D., to institute a series of experiments at Rothamsted on similar lines to those of Hellriegel and Wilgarth in Germany.

A preliminary notice of these interesting and important investigations has lately been published in the *Proceedings of the Royal Society*, vol. lxvii., of which the following is a summary:—

In a paper presented to the Royal Society in 1887-8, and printed in vol. cxxx. of the *Philosophical Transactions*, the authors discussed the history and the present position of the question of the sources of the nitrogen of vegetation. Reference was made to the conclusions arrived at about thirty years ago from the results of Boussingault, and from those obtained at Rothamsted, up to that time. Results were also given of some experiments recently made at Rothamsted in connection with the subject, and

bodies, as also by the plant itself, and within the soil by the agency of electricity; and, finally, that there is fixation under the influence of micro-organisms within the soil, with, or even without, its accompanying growth of higher plants. The balance of evidence seemed undoubtedly in favour of the latter supposition, and of all the various results discussed, those of Hellriegel and Wilgarth were considered to be by far the most definite and significant.

The experiments at Rothamsted were started in August, 1888, with Peas, blue Lupins, and yellow Lupins, and notwithstanding the lateness of the season, the results obtained in this initiative series were not only of value as affording experience on various points, of which advantage was taken in the conduct of the more extended series made in 1889 with Peas, Vetches, Lucerne, red Clover, blue Lupins, and yellow Lupins, but they afforded important evidence on the main point of inquiry itself. In 1889 there were four pots of each description of plant. Of the Peas, Clover, Vetches, and Lucerne, No. 1 was prepared with quartz-sand, without combined nitrogen beyond that in the seed sown; No. 2 with quartz-sand, and "seeded" with a small quantity of turbid watery extract from a rich garden soil; No. 3 was duplicate of No. 2; and No. 4 was with the garden soil itself. Of the blue and yellow Lupins No. 1 was with the prepared quartz-sand; No. 2, same with Lupin soil-extract added; No. 3 was duplicate of No. 2; and No. 4 was with the Lupin soil itself, to which 0.01 per cent. of the plant-ash was added.

The Peas were taken up on October 23 and 24,

Before the end of July, the plants in both pots, 2 and 3, with soil-extract, began to show enhanced growth compared with that in pot 1, without the soil-extract seeding; and eventually, whilst the plants in pot 1 were only 8½ and 8½ inches in height; those in pot 2 with soil extract were 14 and 5½ inches; and those in pot 3, also with soil-extract, were 5½ and 5½ inches high. In pot 4, with the garden soil, the plants showed even somewhat less extended growth than those in pots 2 and 3 with the soil-extract only. But the plants in pot 4 were more vigorous, and whilst they flowered and seeded, neither of those in either pot 2 and 3 did so. In pot 1, without soil-extract, the root development was found to be altogether much less than in either of the other pots, and coincident with this limited growth in pot 1 was the entire absence of nodule formation, and the increased growth in pots 2 and 3 with soil extract is coincident with a very great development of nodules on the roots. In pot 4, with garden soil, its supplying abundance of nitrogen, there was also a considerable development of nodules, but distinctly less than in pots 2 and 3, with soil-extract only.

The Vetches were taken up on October 25. The height of the plants were—in pot 1, without soil-extract, 11½ and 10½ inches; in pot 2, with soil extract, 52½ and 67 inches; in pot 3, also with soil-extract, 61½ and 51 inches; and in pot 4, with garden soil only, 53 and 36 inches.

But, as in the case of Peas, whilst the plants in pot 1, with the garden soil flowered and seeded, those in pots 2 and 3, with the soil extract only, did not, but continued to extend upwards at the expense of the lower parts of the plant.

Here again, as with the Peas, the very restricted growth in pot 1 without soil-extract seeding, was associated with very limited root development, and with the entire absence of nodule formation. On the other hand, the very greatly extended vegetative growth in pots 2 and 3, with soil-extract, was associated with an immense development of root and root-fibre, extending throughout the pots, and with the formation of numerous nodules, which, however, were generally smaller, more distributed over the whole root area, and less accumulated near the surface, than in the case of the Peas. Lastly, in the garden soil, with its liberal supply of combined nitrogen, there was much less development of roots, and less also of nodules, than in the pots with soil-extract only. *J. J. Willis, Hertsfordshire.*

(To be continued.)

TRUFFLES—TRUE AND FALSE.

(Continued from p. 575.)

The naked-spored Truffles belonging to the Gasteromycetes are fewer in number than those belonging to the Ascomycetes. The order containing the naked-spored Truffles is named Hypogaei or "underground fungi." The Tuberales are usually more immersed in the soil than the Hypogaei. The best known member of the Hypogaei is the "Red Truffle of Bath," *Melanogaster variegatus* (fig. 97, f.). The exterior, A, is yellowish or ferruginous in colour, and finely granular; the interior B is soft, intense blue-black marbled with yellow. The naked spores supported in groups of four, on small transparent clubs or basidia, are shown enlarged 200 diameters at c, so that they may be compared with the *ova* containing spores enlarged to the same scale in the illustrated species of *Tuber*. The spores and their supporting basidia are further enlarged to 500 diameters at d, whilst at e a single basidium with its four spore supporters and spores is enlarged to 1000 diameters. A spore is supposed to have fallen from its support at f, and this fallen spore, with its basal hilum, is shown at g. The purple-black spores are very minute, as a comparison with the spores of *Tuber* illustrated to the same scale will show.

This fungus usually grows gregariously some 2 or 3 inches below the surface, at other times partly exposed, only covered by leaves and twigs, under

Beeches, Poplars, &c. The odour of this fungus is strong, aromatic, agreeable, and not unlike bitter almonds; when cooked the taste is sweet, and approved by many. In past times this fungus was commonly sold in the markets of Bath under the name of the "red Truffle," but of late years nothing has been seen of it in the shops or on the stalls.

FIG. 97. MELANOGASTER VARIEGATUS.

This species is eaten on the continent, and is quite harmless. It has been recorded from California.

A close ally of this plant, viz. *M. ambigua*, has frequently been sent to the *Gardener's Chronicle* office for a name. It is very similar in external appearance with the last, and has precisely the same habit of growth. It always attracts attention by its

FIG. 98. SCLERODERMA VULGARE.

potent and truly horrible odour, which has been compared with assafoetida. The odour, or stench, is so strong, that it is almost impossible to remain in the room where the fungi are present. Curiously enough, there is a variety of this species (or the last) which is intermediate in character.

The following notes on the habits of other of the Hypogaei, as observed in this country, have not hitherto been printed.

Octaviania asterosperma.—Generally near the surface, often partially exposed.

T. O. Stephensii.—Near the surface, often wholly superficial, often covered with dead leaves, &c.

Hydnangium carotaeicolor.—Generally superficial.

H. carneum.—Same as last.

Hysterangium nephriticum.—Commonly 8 or 9 inches deep in the ground, with copious mycelium.

H. Thwaitesii.—Same as last.

Rhizogogon rubescens.—Rather superficial, but often some inches deep in very light peaty or fibrous soil.

Hym-nogaster.—There are about a dozen British species, and all are nearly superficial.

H. citrinus is an edible species, and largely consumed by some country folks in the Truffle districts of England. Like some of the species of *Tuber*, it smells strongly of cheese.

Correspondents are constantly sending a common fungus, named *Scleroderma vulgare*, to the office of the *Gardener's Chronicle*, asking if it is a Truffle (fig. 98). This fungus belongs to the same family as the last, but to a different order, viz. the Trichogastres. *Scleroderma vulgare* is really a kind of Puff-ball, with a very thick and hard or corky rind or bark.

The external appearance of *Scleroderma vulgare* is shown at fig. 98, A. It is brown, and clothed with small squarose scales. The interior, B, is deep purple-black in colour, slightly mottled with whitish lines or spots. The spores are borne on fours on club-shaped supports, as shown at c, enlarged 200 diameters. One spore on the right hand sporophore has been removed to show its minute support. A single spore in the act of germination is shown at d, enlarged 500 diameters. The odour is strong and offensive, the habit of growth superficial.

Scleroderma can scarcely be termed an edible fungus, yet it has been often eaten, sometimes for its own sake, and sometimes with the mistaken idea that it is a Truffle. It is frequently used for the adulteration of *porcini* by non-conscientious makers, as well as by sellers of cooked turkeys and fowls supposed to be "Truffled." It is very common in all woods and woody places, from summer till late in the autumn, where it is gathered largely as a substitute for Truffles by persons belonging to the second and third class French and Italian *cafés* of London. When quite young, the *Scleroderma* is perhaps harmless, in this state it has been named "Vegetable Tripe," but when fully developed, unpleasant consequences may be expected if it is consumed in anything but extreme moderation. There are three other British species of *Scleroderma*, viz. *S. bovista*, *S. verrucosum*, and *S. Geaster*.

The true Puff-balls, close allies of the last, are seldom mistaken for Truffles. Of these the most known and safest for the table is the giant Puff-ball *Lycoperdon giganteum*, of large size and snowy colour inside and out.

Mr. C. E. Broome's herbarium containing all the British Truffles, and most of the continental species, is now in the Department of Botany, British Museum, South Kensington, and my microscopic preparations on glass of the fruit of the fungi, mentioned by me in this brief account of true and false Truffles, is in the same department. The illustrations, published herewith, have all been made from living specimens. *Worthington Co., South, Dunstable.*

PLANT PORTRAITS.

CASSIATA LYLLADA. *Garden-flora*, May 1.

CLANISUS DYMPIRI var. MARGINATUS. *Garden*, March 29.

CYRILLIARIS SANCTINUS. *Garden*, April 12.

ENCEPHALICES HILDBRANDI. *Garden-flora*, May 1.

HYPERICUM MOSHAYANUM s. *Revue de Horticulture Belg.*, May. This is alleged to be a hybrid between *H. calycinum* and *H. patulum*. The flowers are large, clear yellow, with the tuft of anthers in the centre of a bright red colour.

LILIUM NEMPESEI var. OPHIOBERUM. *Garden*, April 19.

URSINA PETCHERA var. ALBA. *Garden*, April 26.

HOME CORRESPONDENCE.

THE DAHLIA SEASON.—This week the leading dealers in Dahlias will be busily engaged in sending their young green Dahlia plants to all parts of the country. The traditional time for sending out is May 1, and during the month the number of plants sent out is something astonishing. It is true that new varieties do not now command the prices they once did, but there is no decrease in their production, and the leading Dahlia growers say the demand for plants is as great as ever. Young plants hardened off for travel, laid down on their sides, and packed in soft moss, will travel for a week without taking harm. When unpacked, the plants should be stood in a cold frame, be lightly sprinkled overhead with water, and kept close for two or three days; then they should be repotted and grown on ready for planting out in the open during the first or second week in June. Those who may require show Dahlias of any section can readily make their selection from the lists of nurserymen and dealers in florists' flowers. *R. D.*

THE PROPOSED SHOW IN THE TEMPLE GARDENS.—It is now the 5th of May. In just three weeks the announced Temple Gardens Show of the Royal Horticultural Society is due, but nothing has yet been heard of the schedule of the show. Only last week I inquired of one of the members of the Council, and, strange to say, he could give me no information. Can it be possible that a show is contemplated without a schedule? That is too wild a suggestion. On the other hand, with no schedule of the classes or exhibits yet issued, how is anyone to know what to prepare—or is the show abandoned? If so, that should be made public as early as possible. That may be a wise course, as, so far, the shows have resulted in losses rather than in gains to the Society, except that they may have led to the accession of new Fellows. If that be so, then it is all the more incumbent upon the Council that, having published their intention to hold a grand show in the Temple Gardens at the end of the month, they should keep faith with the Fellows. Whatever course it is proposed to take should be made known at once, as it does seem incredible that, with only three weeks interval of the holding of a great show, that no schedule should have been issued. The loss last year, when the weather was not too propitious, seems to have been about £25. Should the present year's weather be favourable, the result may be a good balance on the right side, whilst possible loss can hardly be considerable. *A.*

STRAWBERRY NOBLE, AND OTHERS.—I was interested in the notes in last week's *Gardeners' Chronicle* about Strawberry Noble. Those who have failed to grow it satisfactorily are advised by Mr. Barham to try again; I am sorry I cannot take his advice, having this season given it a fair trial, and my experience is very different from his. In the first place, I would state that it was employed for very early forcing, and, considering its value as a first early in the open, no doubt others would do as I did. For later fruiting, say the third week in April, it would do better, and force easier than at a much earlier date, but in that case the question arises whether at that date we have not got better-flavoured Strawberries equally fine as Noble, and we have much better-flavoured Strawberries that will come in at the same time. My experience of Noble for early forcing—I mean for fruiting at the end of February and early in March—is, that it was very poor, and a long way behind *Vicomtesse Hélicart de Thury*; the fruit sets badly, and is ill-shaped, more than half of them being deformed, and they do not finish well at that time. Perhaps some of your readers will say it was owing to bad culture, but such was not the case. *La Grosse Sacrée* and *Vicomtesse Hélicart de Thury* were good, and these received the same kind of treatment; moreover, Noble should have been best, it having potted up a week earlier than the others, the plants, single crowns, well matured, and gave every promise of a fine crop of berries. For outdoor culture, I do not say one word against it, but for early forcing I am not inclined to try it again. Flavour, if not good, is often overlooked in a large showy early forced Strawberry; still, flavour and earliness to fruit always count for a great deal. *Marguerite* is excellent for early

work, and will not disappoint those who want an early forcer. *La Grosse Sacrée* can also be depended upon. We find this a useful variety, and of good flavour; but should be removed to a cooler house to finish, the flavour being then much improved. King of the Earlies does not come large enough, so we do not grow it. Our best early or second early Strawberry for fruiting in March and early in April is *Auguste Nicaise*; this is a good variety to succeed those I have named, and it is much liked in Covent Garden, always commanding good prices. If Noble had been a good forcer, we should have seen a greater quantity of it for sale from those who make a speciality of forcing these fruits, and there are a great number in this district. *Auguste Nicaise*, if well done, comes of a large size, is wedge-shaped, of a fine colour and flavour. This was shown by Mr. Smith, of Mentmore, on April 8 last, at the Royal Horticultural Society's meeting in fine condition, and was awarded a Certificate of Merit. Mr. Smith speaks highly of it as an early forcer. I have grown it at Syon for this purpose for two seasons in quantity, and consider it to be one of the best. It is not grown much out-of-doors, the older varieties of proved flavour which do better in our locality being mostly grown. *Auguste Nicaise* loses nearly all its foliage here when planted out, owing probably to fog; and the useful Sir J. Paxton does the same, and this winter it has done badly with us. *Auguste Nicaise* does well when once started, and throws up its flower-spikes well above the leaves, and sets well. The plants are plunged then in a bed of fresh tree leaves close to the glass, covering the frame at night, and removing them to shelves in forcing-houses when the fruits are set. When this variety becomes better known it will be appreciated, as it really is one of the best forcing Strawberries I have met with so far. *G. Wyles, Syon House.*

—As Mr. Sheppard remarks, this Strawberry cannot be praised for its flavour. Now, although this defect may not be considered of great moment by the market gardener, it will certainly not be so in the home gardens, where flavour in a fruit is looked upon as of the most importance. That this want of flavour should exist in a variety which otherwise has every other good quality is unfortunate, and I have no doubt it has caused disappointment to many besides myself, who are looking out for large and faultless early forcing Strawberries. Perhaps everything taken into consideration, we have not a better early variety than *Vicomtesse Hélicart de Thury*. If it did but grow to the size of Noble, or did Noble possess its flavour, there would be little to complain of. *La Grosse Sacrée* is large enough, but it also fails in point of flavour, and with us it has sometimes a deficiency of pollen when very early forced, setting imperfectly in consequence. Moreover, when ripened perfectly, it, like *Keen's Seedling*, is too soft to travel well. For successional crops no variety surpasses *President*; here it is all that can be wished for, our heavy soil suiting its robust constitution. It is, however, liable to be affected by mildew, but that is a malady which need not reach serious consequences if ordinary care be taken in its cultivation. *Thos. Coomber.*

SUCCESSFUL MUSHROOM GROWING.—The appearance of the beds in the Mushroom-house at The Cedars, Harrow Weald, go far to demonstrate that the illustrations of large clumps of Mushrooms with which dealers are wont to decorate their circulars are not unattainable. For a considerable time the beds cropped by Mr. J. Dinsmore, the gardener here, have been covered with such tufts, which were of the best quality. "New Milltrack" is the spawn used, and the beds have never been known to fail to produce excellent crops, commencing to do so in a month to five weeks after spawning. Such uniformly good results afford much satisfaction to employer and gardener alike. *J. O'B.*

THE DYKE BEAUTIFUL.—The flat, fenlike country between Louth and Grimsby is known as The Marsh, locally. First impressions of the country, owing in great measure to dykes taking the place of hedges by the sides of the roads and between the fields, are unfavourable, and everything seems monotonous. But when one has taken a walk across the wide-divided fields, and been invigorated by the wild free air from the German ocean, all such impressions give way to keen pleasure. The charm is chiefly due to the wonderful vegetation in the dykes, the sides of which are covered with the flowers of Marsh Marigolds, which gleam like beaten gold in the sunlight. Looking down the dyke, the eye be-

holds a long vista of gold. Variation in tint is given by the bright lush foliage, and by the pretty white flowers of the Water Crowfoot, with its graceful lacinated leaves swimming on the surface. A sober tint is also given by the brown flowering shoots of the *Equisetums*, the pelate, fertile leaves of which well repay curious examination. Furthermore, the upspringing Yellow Flags and Meadow Sweets promise a like beauty of vegetation in the summer. This is not a feebly attempted description of one dyke, everyone that is crossed or followed lavishes white and gold. Why cannot the dykes be made like unto these throughout the country? I used to know the Isle of Ely well, where the same sort of dykes are frequent, but never a Marigold by their sides. It is not a difficult matter to naturalise these flowers in suitable places, and their beauty and brightness would give ample returns for the trouble taken. I do not feel conscious of any exaggeration in saying that few things in Nature, in its quiet moods, have appeared to me more beautiful than these flower-girt dykes in the Lincolnshire marsh. *C. A. M. Cornichard.*

NARCISSUS "PRODIGY."—Allow me to protest against the figuring and naming of a flower suffering from a common malformation as a new variety. It is well known to growers and observers of Narcissus that this contraction at the mouth is as much a separable accident as the loss of the trumpet by snails and slugs would be. I have at present a whole bed of *N. bicolor* of which almost every flower has precisely this same contraction at the mouth, and I find that *N. bicolor* is especially subject to it in my garden. Surely we have *Dafnifolia* enough and to spare without deformed flowers being added to the lists. I send specimen flowers herewith of (1) *N. bicolor*, (2) *N. grandis*, (3) *N. Horsfieldi*, (4) *N. Emperor*, all of which have not only the contracted mouth of *Prodigy*, but also the peculiar backward curve of the segments, which is also incident to this malformation. Secondary flowers, *i.e.*, those which are thrown up by vigorous bulbs after the first flowering, commonly take this form. It is extremely unlikely that this character will prove really fixed in any *Narcissus*. *G. H. Engelheart, Appleshar, Andover.* [The flower is no more deformed than a double variety. *En.*]

A GOOD COVERING FOR A WALL.—In the span-roofed Rose-house at Gunnersbury is to be seen a capital plan of covering the wall, which retains the soil in the Rose bed. Small plants of *Trachelospermum jasminoides* were put out in the bed in which the Roses are growing, and these have grown freely over the top and down the front of the wall alongside the path in the house. This plant is well adapted for the purpose, being an evergreen; and when covered with blossom, as it always is early in the year, the house being forced early, the perfume must be delightful. As the plant is not injured by hard pruning, it can be kept within bounds for a great number of years; and the roots, not being numerous or strong, as those of many other climbing plants, the border is not robbed to the detriment of the Roses. *E. M.*

SCARLET RUNNER BEANS.—As frequent sowings of this variety of Legume will be made during the next two months, it may be opportune to remark that very pleasant arbours may be made by sowing seeds of the strong growing Champion Runner, 12 inches apart, and a few of Painted Lady at intervals in the row. When the plants are 3 inches high, a little of the soil should be drawn up to them on either side. The sticks may then be put firmly into the ground in front of each plant, bringing them together overhead and tying them in that position with fine tar-string. This done, lay on a matting of short dung, and water the plants copiously in dry weather. The junction of walks in the kitchen garden is an eligible place for such a retreat. *H. W. W.*

WINTERING LETTUCE.—In some places this is a matter of some importance, especially when Lettuce is wanted and must be had during March, which month I consider is about the worst in which to secure good Lettuces, as the winter stock in frames is then well-nigh exhausted, and during February and March the plants are apt to damp-off very much. I have found the best way is to sow seeds at different periods during August and September, and plant them as soon as fit into frames, keeping the lights off at all times when the weather admits of it being done safely. Soon after the New Year, when the Lettuces that were taken up and housed are getting

scarce, some manure and leaves are mixed thoroughly together and put round the frames, so as to afford them a gentle heat, which will bring the Lettuces along at a steady rate. As to varieties, All the Year Round and Neapolitan stand this kind of treatment better than any other. Another method I have adopted is to prick out a large bed of Lettuces on a south border, and place three light boxes over them when the weather gets cold enough to make such protection desirable. I have also taken up and tried to force such hardy varieties as Hicks' Cos and Bath Cos, but with no good results. The best way is to get an early supply of these Lettuces, and put a lot of them out in the autumn at the foot of a south wall. They do not interfere with the wall trees, and one can keep aphides in check by a little watching, and the plants will take care of themselves till the time for tying them up arrives. We are now cutting nice Lettuces from the south wall treated in the above manner. *W. A. Cook, Clampton Bassett.*

EPACRIS.—The present is a good time to prune the late-flowered plants of Epacris, the earlier having been done some weeks since. Growth usually begins at this late period before the bloom is quite over, and it is therefore best not to wait, but shorten back each shoot individually, leaving the spurs about an inch in length; and in some cases, where the heads of the plants are thick, it may be necessary or advisable to thin out some of them, especially those that are weak, which will have the effect of letting the light into the head. The next thing is to afford the plants some slight degree of warmth, say 50° to 55°, and keep them close for a few weeks, and syringe them occasionally. As soon as growth has recommenced generally, they are ready for shifting into pots that have just room enough to allow of a little fresh soil being worked in round the ball. This should be the best, fibry peat, broken up somewhat roughly, and mixed with a fair quantity of sharp sand. The drainage, an important point, should consist of finely broken crocks, an inch in depth, placed over a large crock, covering the hole, and on them a sprinkling of moss. The fresh soil must be rammed hard, as it is very important that the soil be made as firm as possible, or the water passes through too quickly, and the exceedingly fine hair-like roots will not be able to live. As soon as potting is complete, a good soaking should be given, and the plants again placed where they can be favoured with moisture and warmth as before, and as soon as growth is complete, and become a little hardened, the plants will be benefited by being stood in a sheltered, half-shaded place out-of-doors, where they may remain till the autumn, small plants being plunged in coal-ashes. The minima or climbing varieties should not be cut back, but simply thinned, and loosely trained to neat stakes, and such plants form splendid specimens, that are very beautiful when in full bloom. *J. S.*

ASPARAGUS AS A PILLAR PLANT.—Mr. Hudson has growing in a cool-house at Gunnersbury, A. tenuissimus and A. plumosus nanus as pillar plants, and effective plants they are in that position. As a plant to cut the foliage from, the former is certainly the better, the finely cut leaves being good for intermingling with flowers, and especially white ones, in vases, epergnes, &c.; but for grace when growing, the latter is the finer, the leaves on plants of 1 or 2 feet in height standing out almost horizontally, and the point of each leaf droops sufficiently to take off all appearance of stiffness. *E. M.*

JAPANESE CONIFERS.—I have been studying these in their native forests with Dr. Masters' paper on the subject, and have been fortunate enough while travelling in Yesso and northern Japan to get a plentiful supply of cones. I send you photographs of Abies sachalinensis, A. Veitchii, and A. Mariesii, which are as good as species can be. There are five species already described, to which I shall add a sixth. *H. Neijer, Tokio, Japan.*

CRINUM PURPURASCENS.—Dean Herbert did not include Crinum purpurascens in his stoloniferous section because it was not what he considered a truly stoloniferous plant. According to his view, a stolon was a creeping underground sucker which formed a bulb after coming to the surface. Had he been called upon to define the habit of C. purpurascens, he would have said "bulbosis valde profutura." Crinum erubescens is a good example of the stolon bearing Crinum. *R. T. C.*

SOCIETIES.

THE BRITISH FRUIT GROWERS' ASSOCIATION.

The Executive Committee of the above Association held a meeting in the Horticultural Club room, Hotel Windsor, on May 1, T. Francis Rivers, Esq., in the chair. A number of members having been elected, the Hon. Secretary announced that Mr. Shirley Hibberd had consented to read a paper on the "Origin of the Cultivated Strawberry" at the June meeting. The proposed report on the "Present Condition and Prospects of Fruit Culture" was discussed at some length, and letters were read approving of the scheme. The Duke of Bedford sent a cheque for £25, and Earl Fortescue wrote as follows:—"I heartily wish you success in your work. I have long been of opinion that fruit culture may be largely extended in Great Britain and Ireland with advantage to the owners and occupiers of land, and to the general public. Your Association has been rendering a real public service both by directing public attention to fruit culture for profit in this country, and by helping to dispel the erroneous idea too freely circulated respecting the enormous returns obtainable from a small capital employed in fruit cultivation. Your report truly observes that much harm has been done by ill-informed advisers, for fruit growing cannot be made to pay a fair profit without practical knowledge of the work, starting with a carefully considered scheme, and sound judgment in carrying it out. A sub-committee was appointed to prepare a scheme to deal with the matter."

Mr. L. Castle submitted a note upon Paris Green as an insecticide for special application to fruit trees, and described some experiments. The strongest mixture of this poisonous substance appeared to have no direct effect upon caterpillars, and it is only when it is lodged on the surface of the leaf and consumed by them that it becomes destructive. It had little or no effect upon the leaves as tried, and except when the mixture is not properly stirred, there seems little danger in this respect. Experiments were also tried upon plants in pots, to ascertain if any ill effect was produced by the Paris Green passing through the soil to the roots; but the plants were quite uninjured, and, being insoluble, it is not taken up by the roots. It was mentioned that Miss Ormrod had kindly sent much information upon the matter, including her recent "Report upon Injurious Insects." A large fruit-grower also wrote as follows:—"We have a plentiful crop of caterpillars; we are, however, vigorously attacking them with Paris Green, London Purple, and Quassia. We can hardly determine yet which will answer best, but the Quassia appears to be quickest in its action, as it kills by contact, but with the other two you have to wait until they have consumed the poison."

THE SCOTTISH HORTICULTURAL ASSOCIATION.

The ordinary monthly meeting of this Association was held on the 6th inst. in the hall of the Young Men's Christian Association, Edinburgh, Mr. Morrison, Vice-President, in the chair. A paper was read by Mr. W. Sutherland, entitled "A Popular History of the Potato," which elicited an interesting discussion.

Some interesting exhibits were on the table. Mr. Henderson, Clermiston, exhibited a stand of twelve blooms of Niphetos Rose, cut from a plant three years old, carrying seventy other similar blooms, and which has been flowering freely throughout the winter. The flowers exhibited were remarkable for the great size and substance of their petals, several of the buds measuring 1 inches in length. A Cultural Certificate was awarded in recognition of their excellence. The same exhibitor also showed a fine spike of Digitalis purpurea in flower, with excellent foliage attached, showing that it was amenable to forcing, and suggesting its usefulness in that way, along with the white variety, for the decoration of the conservatory in spring.

Mr. Calder, of Calderbank, Trinity, showed a very distinct Rhododendron, named Mrs. Calder. It is the result of a cross between R. Edgworthii and R. formosum, again intercrossed. The flowers are large, white, prettily fringed on the margin, and deliciously fragrant. It was awarded a First-class Certificate. From Mr. Calder also came a fine pair

of plants of Heuchera sanguinea from the greenhouse, well-bloomed, fresh, and attractive.

Mr. Lindsay, Bonington Bank House, showed a good example of Vallota purpurea major, which was much admired.

Mr. Grant, St. Leonards, Dunfermline, exhibited a specimen Masdevallia Houatiana, so well bloomed, that it was awarded a Cultural Certificate.

Mr. Morris, Trinity Lodge, brought a series of varieties of Rhododendron hybrids between Sikkim and Bhootan species, all cut from the open. They are the result of experiments made by the late Mr. Anderson Henry, are very distinct, and in most cases beautiful, but obviously better adapted to the greenhouse or winter garden than the open in our climate. Mr. McMillan, Trinity, also showed some beautiful greenhouse Rhododendrons in truss.

Messrs. Laing & Mather, Kelso, exhibited plants in bloom of Messrs. Linden's new Souvenir de la Malmaison Carnation, Madame Arthur Warocque. The plant is compact, dwarf, freely branching in habit. The flowers are deep rich red, and freely produced. It was awarded a First-class Certificate.

Obituary.

JAMES CHEETHAM.—Two men of some mark among the Northern florists have recently died. One is James Cheetham, who died at Rochdale, a few days since, at an advanced age. For many years Cheetham was a florist of note, though scarcely in the foremost rank, growing Auriculas, Polyanthus, Tulips, and other things. He was somewhat prominently known in connection with old Robin Lancashire's magnificent grey-edged Auricula Hero. It was first shown by Robin at Rochdale, in 1846, and in the class competition was placed second to Grimes' Privateer, a variety much inferior to it. In great grief at his disappointment, Robin sold his stock of Hero—some eight or ten plants—for a small sum, but afterwards wished to buy it back, but could not do so. The purchaser sold it to Cheetham, who sent it out as Cheetham's Lancashire Hero; and now, nearly a half century afterwards, it remains still one of the best grey-edges in cultivation. In common with some other light-mealed grey-edges, it will sometimes come green-edged; a young plant will sometimes throw a green truss, or an old plant, if the truss becomes bare in December or January. Two or three plants of Lancashire Hero in its green form were shown at the Royal Aquarium on the 29th ult.

MR. ALDERMAN DANIEL WOOLLEY, of Stockport, was for many years in business there as a druggist and seedsman. Tulips were his great hobby, and he was generally to the fore on the occasion of the annual exhibition of the Royal National Tulip Society, and at the shows held in and round Stockport. Mr. Woolley took an active part in local affairs, and had been a member of the Corporation of Stockport for a considerable period. *R. D.*

JAMES FLOOD.—Many of our readers will mourn with regret of the death on May 1 of Mr. Jas. Flood in his fifty-second year. The deceased was a frequent attendant at all the large Metropolitan and Provincial horticultural exhibitions, and had a wide circle of friends. His birthplace stood on land which is now Bogent's Park; and his father and he assisted the late Mr. Marnock in the laying out of the Royal Botanic Garden of London, and for some time afterwards. He was buried at Finchley Cemetery on Wednesday, May 7.

JOSEPH ROBINSON.—The recent death at Slough of Mr. Joseph Robinson removed from our midst another of that band of florists who, as cultivators and exhibitors, made floriculture so famous forty and fifty years ago. To many of the present generation of florists his name will scarcely be known; but the records of the exhibitions of the Royal Botanic and Royal Horticultural Societies, as given in the *Gardeners' Chronicle* between 1840 and 1858, show that both as a cultivator and exhibitor of Pelargoniums, Chrysanthemums, Verbenas, &c., he

achieved great successes. He was a contemporary of William Barnes, James Cutbush, William Holmes, James Ivery, F. R. Kinghorn, C. Ledgard, C. P. Lockyer, A. Parsons, John Salter, George Smith, R. Stains, C. Turner, and others, who in their day covered the metropolitan district with a network of floricultural societies, and a great impetus to popularizing the leading florists flowers.

Born at Chelmsford, in February, 1811, his early associations with gardening are not known; but it was while gardener to James Simpson, Esq., Thames Bank, Ilmlico, that he made his mark on contemporary floriculture, taking many medals, 1st prizes, &c., at the above-named exhibitions, and at others held within the area of the metropolis. He raised a good many new florists' flowers, but is best remembered as having produced Robinson's Scarlet Defiance Verbenas, a vigorous growing bright-coloured bedding variety, that was largely grown, and possibly may be found in some collections to this day. The stock of this Verbenas was purchased by the late Mr. Charles Turner for the sum of £20, and distributed by him.

The Florist and Garden Miscellany contain some articles from his pen. On leaving Ilmlico, about 1848, he went to live at Slough, and engaged himself in laying-out work under Mr. Charles Turner. Some years ago he retired from active life. About eighteen months before his death, his health began to fail him, and it gradually declined until he died in calmness and peace. He outlived most of his fellow-workers in the same field, but there are some who yet cherish his memory, and who will hear of his death with regret. R. D.

VARIORUM.

ESSENTIALS TO SUCCESS IN HORTICULTURE

—Professor L. H. BAYLEY, late Horticulturist of the Michigan Agriculture Experimental Station, has given *Ten essentials* to success in Horticulture, which appear to be as applicable to the Old World as to the New, of which the following is a summary:—

1. The first condition is the man—a thinking man, one who knows his market as well as his orchard; who can reason justly from cause to effect. Good brains are as important as good land.

2. The second consideration is the land; not necessarily that which will grow the most, but rather that which will grow the best, the highest coloured, and best quality of fruit.

3. Culture.—Crops need culture. Good cultivation consists not so much in digging and ploughing deeply, as in stirring often. This keeps the soil soft, moist, and pliable.

4. Manure, and lots of it.—The best is stable-manure, applied to the land as fast as made. Put it on the ground in the autumn. Do not compost stable manure, but keep it level and moist in broad clamps. It will be all the better if kept shaded. Compost is good, not for the stable manure, but for miscellaneous refuse, leaves, garden rubbish, lawn-mowings, &c. A compost pile should be forked over two or three times a year.

5. Location.—High grounds are best for fruit, not because they are wind-swept, as some people erroneously suppose, but because they drain the cold air down and away; hence "protected" elevations are the best. A windbreak should not be so thick as to absorb the moisture in the atmosphere. It should be planted far enough away, so as not to interfere with, or retard the growth of, the young trees. The use of Beech and Maple trees are advised for wind-breaks.

6. Varieties.—For this it is necessary to study the market.

7. Marketing.—Study tasty, effective, and honest packing.

8. Pedigree is as important for fruit as for horses or cattle, as it determines the colour, size, and quality, of our products.

9. Succession of crops, applying especially to vegetable growing. Many of those come off early,

so that another crop can occupy the ground, viz., Radishes, Turnips, Celery. Thus, hotbeds may serve successive uses, and a good portion of our capital be turned several times a year.

10. Market facilities.—The gardener must adapt himself to the markets, as they will not adapt themselves to him. If far from market, that must be grown which can be cheaply transported, and which carries a good deal of value in small bulk.

THE WEEPING-TREE MYSTERY.—Prof. Herbert Osborn has called our attention to an article in the Dallas (Texas) Morning News of October 9, in which a very well written and humorous account is given of the solution by the reporter of that paper of the mystery of the so-called "weeping-trees," reports of which from Grayson County, and other parts of Texas, are said to have "set the State agog with various explanations of the phenomenon, ranging from the superstitious credence of the supernaturally inclined to the positive denial and derisive laugh of the constitutionally sceptical." The brave reporter, however, upon the discovery of one of these remarkable trees in Dallas, laying aside all superstition, climbed courageously up the trunk, and discovered that the tears were shed by a multitude of small insects of dark green colour, with gold under the wings, which adhered to the bark, and scampered about when disturbed, and flew away when pressed too closely." Prof. G. W. Curtis, of the Texas Agricultural and Mechanical College, secured specimens, and sent them to Prof. Osborn, who recognised them as the common little leaf-hopper, Proconia (Oncometopia) undata, which we have referred to in previous writings, and on pp. 53 and 54 of vol. i. of *Insect Life*, as occurring upon the Orange in Florida, and upon Cotton plants in other Southern States, and which we have there stated is remarkable for the distance to which it ejects drops of honey-dew. We frequently met with this species in the Cotton fields in the summer of 1879, and noted the extraordinary abundance of the secretion. Prof. Curtis, in his letter to Prof. Osborn, stated that in Dallas they made the tree present a decided appearance of weeping quite profusely, the drops being small, but coming quite thick and fast. Each insect would eject a drop at intervals of two seconds during a period of several minutes, and would then stop for a little while. *Insect Life*.

The districts indicated by number in the first column are the following:—
Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.
Principal Grazing Areas, Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE WEATHER.

THE PAST WEEK.

The following summary record of the weather for the week ending May 3, is furnished from the Meteorological Office:—

"The weather has been very fine and bright over the greater part of the kingdom: in Ireland and the extreme north and west of Scotland, however, the conditions have been rather showery and unsettled. Thunder and lightning occurred in different parts of the country on Saturday.

"The temperature was low during the early days of the period, and subsequently the daily maxima became high, although the minimum continued rather low. The average for the week has varied from 1° above the mean for the time of year in Scotland to 2° and 3° below it in 'England, N.E.,' and 'England, E.' The highest of the maxima were generally recorded on Saturday, when the thermometer rose to between 65° and 67° in Scotland, 65° and 67° in Ireland, and to between 65° and 71° over England. The lowest of the minima, which were registered on irregular dates, ranged from 28° in 'Scotland, E.,' and 'England, S.W.,' and 29° in 'Scotland, W.,' and 'Ireland, N.,' to 35° in England, N.W., and 40° in the 'Channel Islands.'

"The rainfall has been more than the mean in Ireland, and especially over the northern parts of the country, but less over Great Britain; in the principal Wheat-producing districts the fall was trifling.

"Bright sunshine, though very prevalent, has been less so than it was last week in Ireland; over England and Scotland, however, a very decided increase is shown. The percentage of the possible

duration varied from 35 in 'Ireland, N.' to 60 in 'England, S. & 64 in 'England, E.,' and to 74 in the 'Channel Islands.'

(By the term "accumulated temperature" is meant a figure representing the aggregate amount, as well as the duration, of the excess or defect of temperature above or below 42° Fahr. for the period named; and this combined result is explained in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.)

Table with columns: DISTRICTS, TEMPERATURE (ACCUMULATED), RAINFALL, BRIGHT SUN. Rows 1-12 corresponding to various districts.

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.
Principal Grazing Areas, Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

MARKETS.

COVENT GARDEN, May 8.

Business steady throughout the week. Hothouse fruit in fair supply.

FRUIT—AVERAGE WHOLESALE PRICES.

Table listing fruit prices: Apples, peaches, plums, grapes, lemons, melons, strawberries, etc.

VEGETABLES—AVERAGE RETAIL PRICES.

Table listing vegetable prices: Asparagus, beans, beet, carrots, cauliflower, celery, cucumbers, endive, herbs, lettuce, leeks, onions, mushrooms, etc.

PLANTS IN POTS—AVERAGE WHOLESALE PRICES.

Table listing plant prices: Araia Sieboldi, Arum lilies, Begonia, Calceolarias, Cyclamen, Cyperus, Dianthus, Dracaena, Erica, Euonymus, Ficus, etc.

* Bedding plants in variety in boxes, and also in pots.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing various cut flowers and their prices, including Abutilons, Azaleas, Begonias, Bouvardias, Callanthopias, etc.

CUCUMBER-BLOOM IN VARIETY.

SEEDS.

LONDON: May 7.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, write that to-day's market was characterised by the quietude usual during the summer months...

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, for the week ending May 3:—Wheat, 30s. 6d.; Barley, 27s. 9d.; Oats, 18s. 8d.

FRUIT AND VEGETABLES.

SPITALFIELDS: May 7.—Plentiful supplies of all kinds of green stuffs; demand only moderate. Potato trade very quiet. Prices: Cabbages, 2s. to 3s. per tally; Seakale, 1s. 3d. to 1s. 9d. per bushel...

POTATOS.

BOHOUGH AND SPITALFIELDS: May 6.—Quotations:—Regents, 40s. to 60s.; Hebrons, 30s. to 50s.; Magnums, black lands, 35s. to 42s. 6d.; Lincolns, 50s. to 55s.; Kent and Essex, 50s. to 60s.; Yorks, 55s. to 75s.; Scotch, 60s. to 110s.; Imperators, 55s. to 70s.; new Malta and Canary Islands, £10 to £12 per ton.

NOTICES TO CORRESPONDENTS.

Owing to the large extension of our circulation we are under the necessity of going to press at an earlier time than heretofore, and request our regular correspondents to favour us with their communications as EARLY IN THE WEEK AS POSSIBLE.

ANACULA: T. S. Pin and thrum are not marks of sex, in the sense you suppose: the flowers are bisexual. It is a pin when the stigma is visible above the plane of the bloom; and a thrum when

it is level with the anthers or below the orifice, and consequently inconspicuous.

BUTCHER'S BROOM: C. A. H. C. "We should not mind telling you" if we knew. Unfortunately we do not know. It may secrete a juice that is acceptable to insects, and so aid fertilisation.

CARNATIONS: Aster. Your plants are attacked by nematoid worms. Start anew with fresh soil and fresh plants.

CUCUMBERS DISEASED: D. K. Please send a few portions of the roots of the affected plants.

ERRATUM.—At p. 544, line 13 from top, instead of 100 to 400 read 1-4; so that whilst Dianthus barbatus shows 1-4, and D. alpinus 450, or nearly so, the hybrid shows about 200. J. M. M.

GARDEN PLAN: L. J. The plan would answer for a carpet-bed; but for other beds in the flower-garden, the taste of the day tends towards simplicity of design, and rightly so. Short notes on cultural topics are acceptable occasionally.

MAIN CROP PEAS, 2 FEET HIGH: E. M. There are few really good main crop Peas of so low a growth as 2 feet. Some of Dr. Maclean's Peas as Advancer and Dr. Maclean, are excellent; but their height is nearer 3 feet. Veitch's Perfection is about the same height; Chelsea Gem is under 2 feet high, and is reputed to be good both early and late. All of these varieties are of good flavour, and might be grown as field crops without sticks.

NAMES OF PLANTS: Uprunius. Helleborus viridis.—E. D. L. 1, Sedum latifolium; 2, Leioophyllum alias Ledum buxifolium; 3, 4, Fritillaria pyrenaica; 5, Claytonia perfoliata.—H. C. x1, Choisya ternata; x2, Amelanchier vulgaris, snowy Medlar.—C. S. 1, Diplacus glutinosus; 2, Lonicera Ledebourii; 3, Iberis sempervirens.—G. W. 1, Dendrobium primuminum; 2, D. Pierardii.—Mrs. Stinson. Cattleya intermedia; Adiantum concinnum.—Figs. Dendrobium fimbriatum ocellatum; Eupatorium (=Hebelclinium) anthinum.—Figs. Primula denticulata cashmeriana; Pittonia Verschaffeltii argyrovaria.—C. A. H. 1, Asclepias curassavica; 2, Doodaea aspera; 3, Polypodium crassifolium; 4, P. phymatodes.—F. J. B. Primula capitata var. H. G. M. Send a flower to some grower of Azaleas. We cannot undertake to name them.

NURSERY AND GARDEN TERMS: H. D. An amateur: one who gardens without idea of pecuniary profit. Gardener and florist: A gardener who is a florist (special), not necessarily a tradesman. Professional gardener: A man who has had a garden training, and follows the business for a livelihood. Nurseryman: One who grows and sells plants, hardy or otherwise.

PIKE BUG: F. W. B. A cocoon allied to American blight. Cut off all you can and burn, and apply petroleum emulsion in spray to the rest.

PRIMROSES: T. H. W. Primroses with leafy calyxes. Good examples of their kind quite worth growing on.

SALARY AND NOTICE TO QUIT: A. B. Being a yearly servant paid quarterly, you can, in the absence of any agreement, insist on a quarter's notice, or its equivalent.

VINE LEAVES: P. G. The leaves sent are very thin and bespeak want of vigour. Such leaves are very likely to get scorched by a burst of hot sunshine, whilst the leaves are wet and the house insufficiently ventilated.

WEEVIL: J. H. Very destructive. Trap them with pieces of Carrot laid about; visit the houses at night, and demolish the enemy when feeding.

COMMUNICATIONS RECEIVED.—W. C.—J. M. McE.—G. N.—T. B.—W. E. G.—W. T. D.—J. H. G.—H. R.—C. H. H.—T. E. H.—H. N. K., Singapore.—W. A. S., New York.—J. W. H.—B. Q.—G. Paul.—E. B.—R. Gilbert.—R. A. R.—E. M.—J. J.—J. D.—J. H. & Son.—J. C.—A. D.—D. C. P.—C. Lock.—E. S. & Co.—Club Ave.—G. C. W.—A. E. and Rhododendrons.—J. W. K.

ENQUIRIES.

"He that questioneth much shall learn much."—Bacon. GINGER BEER PLANT.—Will any correspondent (1), oblige me with a specimen of this plant; (2), say exactly how it is used, what ingredients are made use of, and in what proportions; (3), what was its origin; (4), how long it has been known? H. Marshall Ward, The Laurels, Englefield Green, Staines.

For Green and Black Fly, American Blight, Camellia Scale, Red Spider, Mealy Bug, Brown and White Scale Worms, Wood Lice, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL. 15, PRINCESS STREET, EDINBURGH, July 15, 1887.—Dear Sirs, I have thoroughly tested a sample of a new Insecticide which you were so good to send me. At the rate of 1 oz. to a gallon of water at a temperature of 95°, I find it kills Green Fly immediately. Double the strength, or 2 oz. to a gallon at 120°, seals the fate of Scale of all sorts in a few seconds; while 3 oz. to a gallon at same temperature effectually dissolves Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through common syringe, or garden engine, a much severer test of efficiency than when applied by hand-washing or spray. I remain, dear Sirs, yours truly. (Signed) A. MACKENZIE, of Messrs. Methven & Sons.

Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888. "GENTLEMEN—I have given your Insecticide, Picrena," a good trial in competition with many others. I am pleased to say that I have found it to be more effective in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale. (Signed) R. S. WILLIAMS.

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins (1 and 2 gallons), 10s. 6d. and 20s. each; in quantities of 5 gallons and upwards, 5s. per gallon.

Prepared only by DUNCAN, FLOCKHART & CO., Chemists to the Queen, Edinburgh.

May be had from R. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from WILLIAM EDWARDS AND SON, 157, Queen Victoria Street, London.

Great Reduction in Price of LETHORION (VAPOUR CONE).

Nothing can surpass this method for the total destruction of insect Pests in greenhouses. IT CANNOT fail where the houses are covered with any possible injury to the most delicate plants. PRICES For Frames, &c., of 50 cubic feet, 6d.; 100 feet, 9d.; Houses, &c., of 100 feet, 1s.; 200 feet, 1s. 6d.; 300 feet, 2s. each. Owing to the enormous demand, intending users should order their Greenhouses Early orders to secure a supply.

Testimonials.
"Sturton Castle, January 5, 1890.
"SIR, As you requested my opinion of the houses which you erected for me some 4 years ago, I beg to inform you that I consider them a perfect success, and I have recommended them to many of my neighbours.—Yours truly (signed) MARCUS STELLAR."

"Hornby Castle, Lincolnshire, February, 1890.
"Major FOSBER has much pleasure in stating that the vinery and forcing houses which were erected by Mr. Helliwell in 1884, continue to give perfect satisfaction, both to himself and his gardener."

"Estate Office, Ripley, Yorkshire, January 23, 1890.
"Sir HENRY FOLEY has much pleasure in stating that the glazing work executed by you, under your patented system, at the Ripley Castle Gardens, has been in every respect entirely satisfactory. The work has stood its 8 years' wear and tear extremely well, and has hiterto cost nothing to keep in repair."

MESSINGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus.

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of glass-houses, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in agricultural building and heating, is not a sale merely before attempted. It should be in the hands of every amateur or professional gardener, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price 2s. post free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country, an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The inventing is possessed by a capable and experienced staff of workmen, and in the very best style, at prices which defy competition. Survey made and estimate made on in any part of the country. Plans and Estimates free on application.

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is

THE "WORCESTER HERALD," ESTABLISHED 1700.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other Property advertised in the Columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let would do well to advertise in the "WORCESTER HERALD," the Leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

NOTICE TO ADVERTISERS.—In many instances Remittance in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable to No. 42, BUCKLE LANE, to Mr. BARR, and to state the number of a Postal Order, is known, and it has been made payable to a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from repeating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

B. S. WILLIAMS and SON beg to intimate that they have at present in their Nursery and upon their Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BALDIE, FOREMAN, or JOUBNEYMAN. TO GARDENERS.—Situation required for Son (age 15). Strong, willing to learn, and Well-educated.—Terms, THOS. SUTTON, Queen's Street, West-Edinburgh, Bedford.

TO GARDENERS.—A Solicitor's Son (age 19) wishes to place himself where he can learn Floral and Fruit Gardening, and the Management of Hot-houses. No objection to a Moderate Premium.—Apply to S. O'LEARD, Bilsdale, Chelmsford.

SHOPMAN.—Young, sharp, and experienced in Retail Seed and Plant Trade.—SMALL AND CO., 25, Lime Street, London, E.C.

SHOPMAN, or ASSISTANT.—Age 21; eight and a half years' experience, London and Provincial. Good knowledge of Seeds, Plants, and Nursery Stock. Good references.—Z. T. Russell Mills, Russell Square, London, W.C.

SHOPMAN, or SECOND.—Eleven years' experience, Scotland and Ireland. Practical knowledge of Seed and Nursery Trade. Book-keeping and Correspondence. Highest references.—J. L. S., Tofts, Turlington, N.B.

SHOPMAN (UNDER) in Good Shop.—Age 19; five years' experience.—G. GOESLING, Bartlett's Cottage, New Road, Bury, Bedford.

TO FLORISTS and SEEDSMEN.—Wanted, by a respectable Man, age 21, a situation in Florist and Seed Shop. Experienced in all kinds of make-up work.—HARRY FARAGE, Florist, South Croydon.

TO FLORISTS.—Wanted, a situation in a first-class Floral Business. Good Wreath, Bouquet, Cross, and Spray Maker. Six years in last situation.—C. Hogg's, Queen Street, Cardiff.

HOLLOWAY'S PILLS.—Teachings of Experience.—The united testimony of thousands, extending over more than fifty years, most strongly recommends these Pills as the best purifiers, the most efficacious, and the surest restoratives. They never prove deleterious, or give merely temporary relief, but attack all ailments of the stomach, lungs, liver, head, and bowels in the safe and legitimate way by cleansing the blood, and so eradicating those impurities which are the source and constituents of almost every disease. Their medicinal efficacy is wonderful in removing ordered constipations. Their action embraces all that is desirable in a household medicine. They remove every noxious and effete matter, and thus the strength is nurtured and the energies stimulated.

Send for ILLUSTRATED LIST of

JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,

For Raising Water for the Supply of Towns, Villages, Irrigation, Railway Stations, Mansions, Fountains, Farms, &c.

No Cost for Motive Power, which is obtained from a Stream of Water passing through the Ram.

NO OILING OR PACKING REQUIRED.

MADE IN SIZES TO RAISE FROM 300 TO 200,000 GALLONS PER DAY. WILL FORCE TO A HEIGHT OF 1500 FEET.

SPECIAL RAMS for HIGH FALLS to send up Two Gallons out of every Five Gallons passing through them.

This View represents a Ram worked by impure river water, whilst pumping pure water from a well or spring, and forcing it to a small reservoir on the hill, at an elevation of 250 feet, and a distance of 1 mile, from which reservoir the water is gravitated for fire extinguishing and general requirements of mansion, stables, farm and village.

This Ram works with absolutely no metal in motion.

BLAKE'S HYDRAULIC RAMS

SALES BY AUCTION.

Watford, Leytonstone, and Blackheath. SALES OF BEDDING AND GREENHOUSE PLANTS. MESSRS. PROTHEROE AND MORRIS will

SELL BY AUCTION, as follows:— WATERLOO, WEDN. DAY, May 21, at 2 o'clock, at The Nursery, 11, High Street, Watford, by order of Mr. A. P. BARRY, 1240 well-grown GREENHOUSE and BEDDING PLANTS.

FRIDAY NEXT. The whole of the VALUABLE COLLECTION OF ESTABLISHED ORCHIDS, by order of F. Briesemann, Esq., of Paragon House, Blackheath, who is leaving England to reside abroad.

MESSRS. PROTHEROE AND MORRIS are instructed to SELL BY AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, May 25, at half past 12 o'clock, precisely, without reserve, the choice COLLECTION of well-grown ESTABLISHED ORCHIDS, including, amongst numerous fine species, the following:—

Special Sale, Friday, May 30. ORCHIDS IN FLOWER. MESSRS. PROTHEROE AND MORRIS respectfully announce, by this means, the NEXT SPECIAL SALE OF ORCHIDS IN FLOWER will take place as above, for which they will be GLAD TO RECEIVE NOTICE OF ENTRIES AS EARLY AS POSSIBLE.

Friday, June 6. Important to Orchid Farmers and Others. The unique and singularly beautiful COLLECTION of Life-size WATER-COLOURED DRAWINGS OF ORCHIDS, by Durand, comprising 256 Drawings in 22 handsomely bound volumes, is formed by the late John Day, Esq., of Tottenham, and printed specially for him at great expense, in the style of format of the most valuable Collection of Orchid Plants ever extant.

MESSRS. PROTHEROE AND MORRIS have Valuable Lots of Orchids, to be sold by Auction, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY, June 6, 1890, at 2 o'clock precisely, in one lot. May be viewed at the Auctioneers' Offices two days prior to the Sale, or at any previous time by appointment. Descriptive Catalogues are now ready, and will be forwarded on application to the Auctioneers, 67 and 68, Cheapside, London, E.C.

Priority Nursery, Acton Lane, Acton, W. To Nurserymen, Gentlemen, and Others. THE FIRST ANNUAL SALE of 12,000 Surplus Stock of PLANTS. MESSRS. W. EYDMANN AND SON have received instructions from Mr. J. C. Jennings, the Proprietor, to SELL BY PUBLIC AUCTION, on the above Premises, on THURSDAY, May 22, 1890, at 12 for 1 o'clock, the Surplus Stock of GREENHOUSE and GREENHOUSE PLANTS, consisting of Pelargoniums, Fuchsias, Marguerites, scarlet, white, double ivy-leaved and rose-scented Geraniums, double white Primulas, various Ferns, Zinnias, large Camellias, Tree Liliums, Ficus elastica, Ficus repens, large Stephanotis, and various other Plants, &c.; useful OAT CRUSHER, Seakale POTTS, new view of GREENHOUSES, &c. Catalogue may be obtained on the Premises, and at the Auctioneers' Office, High Street, Acton, W.

ASHFORD, MIDDLESEX. FRUIT FARMS, MARKET GARDEN, and ACCOMMODATION FOR LANDS, in the well-situated Small Capitals and Vineyards, the purchase-money being payable by instalments extending over nine years; 75 acres of important Freehold Land, having the extensive frontage of 2354 feet to the main road, and being only one mile and one-half distant from Ashford Station on the London and South Western Railway, and 17 miles from London, thus being within easy reach of the metropolitan markets. The land is situated in a popular and healthy locality, and the whole of the soil renders it peculiarly adapted to the Cultivation of Fruit, Flowers, and Vegetables, an industry extensively carried on in this neighbourhood. The present Sale is therefore a most desirable opportunity for purchasing Small Freeholds in a proverbially healthy locality, and developing the combined advantages of residence with a lucrative, pleasant, and refined occupation. With possession on completion of terms.

MESSRS. HUMBERT, SON and FLINT are instructed to SELL the above by AUCTION, at the Mart, Tokenhouse Yard, E.C., on WEDNESDAY, June 18, 1890, at 2 o'clock precisely, in numerous Lots. Full particulars apply to Mr. PURDUSING, Small Freeholds, at the Mart, E.C., and of the Auctioneers, 11, Scribe Street, Lincoln's-Inn, W.C., and Watford, Herts.

To Nurserymen, Gardeners, and Others. TO BE SOLD, the Lease of a well-established NURSERY, 11 Greenhouses, well-heated Pits, good Stable, &c., &c., with 10 acres of Land, in a fine situation, in a healthy locality, and in a good situation, with or without Florist Shop in main thoroughfare. Price £100. Apply on Premises, Waverley Nursery, Waverley Place, St. John's-Wood, N.W.

FOR SALE, A SMALL NURSERY, Freehold Premises and good Well, capital Show House, and four other Specialties, in the well-situated locality of the new Heath, Tottenham, N. E. All in good order. Rapidly increasing suburb. Price, Freehold complete, £100; or owner would let the same. Rent, £20. Full particulars apply to T. BRADSHAW, Ravenswood Nursery, Ravenswood Road, Barking, S.W.

To Nurserymen and Florists, London, W. TO BE SOLD, a first-class NURSERY within 7 miles of Covent Garden, comprising about 1 acre of Land, with two Cottages and eight large Glass-houses therein, all well stocked and heated with Hot water. Lease three years. Terms moderate. Apply to W. E. 130, Percy Road, Shepherd's Bush, W.

To Gardeners. FOR DISPOSAL, a good JOBBING BUSINESS, with three Greenhouses, full of Stock, A Small Stable and Tobacco Shop attached. Full particulars apply to W. E. 130, Percy Road, Shepherd's Bush, W.

To Gardeners. FOR DISPOSAL, a Small JOBBING BUSINESS, with Span-roof greenhouse 30 feet long, Hot-water, Stocked with Bedding Plants, &c. All Tools complete. By letter, first instance, to R. N., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

West of England. TO BE LET or SOLD, an exceptionally favourable tenancy, a very old-established general NURSERY BUSINESS, which has only changed hands three times during the last 50 years. Area about 25 acres, all in a rugged form, of which 18 are Leasehold; numerous Glass-houses, Dwelling-house, Cottage Residence, Manager's House, Labelling Cottages, and all well equipped. The Land is in a high state of cultivation, and there is a large assortment of general Nursery Stock, including an extensive collection of Fruit Trees.

A Lease will be granted at a moderate rental, and the Vendors will be open to consider any reasonable proposal with regard to the Stock. Particulars may be had of Messrs. PROTHEROE AND MORRIS, Auctioneers, 67 and 68, Cheapside, London, E.C.

TO BE LET or SOLD, a FREEHOLD NURSERY, 6 acres of Land, with House, Seed Business combined, doing good trade; splendid supply of water. Capital investment. Particulars, apply, BRYANT, Nursery, Chippinham.

TO LET, a well-established NURSERY, about 12 acres in extent, well stocked and in fine condition, situated near a large city.—Full particulars on application to A. B., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

PROTHEROE AND MORRIS, HORTICULTURAL MARKET GARDEN and FRUIT AUCTIONEERS and VALUERS, 67 and 68, Cheapside, London, E.C., and at Leytonstone, E. Monthly Horticultural Register had on application.

ORCHIDS. THE LIVERPOOL HORTICULTURAL COMPANY

(JOHN COWAN), Limited, have just received consignments of Orchids from Mexico, Brazil, India, and other countries. The Co. have also an immense stock of Established Orchids, all of which they offer at extremely reasonable prices. Lists of names and particulars, together with information to the Co., The Vineyard and Nurseries, Garston, near Liverpool.

NOTICE TO CREDITORS AND DEBTORS.—All parties having claims against the late Mr. WILLIAM LEARMONT, NURSERYMAN, Lar-ehield, Dumfries, are hereby required to lodge them with JAMES H. MCGOWAN, Solicitor, Dumfries, Agent for his Trustees and Executors, within 14 days of the date of this notice, for payment; and all parties indebted to Mr. Learmont are requested to make payment of their Accounts to Mr. MCGOWAN. The Business of NURSERYMAN was long carried on by Mr. LEARMONT but will be continued in the name of his TRUSTEES for behoof of his Widow and family under a suitable Manager. Dumfries, May 5, 1890.

CLIBRAN'S A GAY GREENHOUSE. Ivy-leaved Geraniums, beautiful sorts, 4s. per dozen; Double Geraniums, 4s., 6s., and 9s. per dozen; Zonal Geraniums, 4s., 6s., and 9s. per dozen; or for growing on to bloom next winter, 4s., 6s., and 9s. per dozen. Pelargoniums, show, fancy, or large-flowered, to bloom shortly, 3s. and 4s. per dozen. Bouvardias, small, for growing in pots, 4s. per dozen. Columbus, 4s., 6s., and 8s. per dozen. Tropaeolums, 6s. 2s., 2s., and 1s. 2d. per dozen. Flowering Plants, 8s., 12s., and 18s. 6d. per dozen. Greenhouse Climbers, 6s., 8s., 10s., and 12s. per dozen. 3s., 4s., 5s., and 1s. 6d. each. 12 Stencils, 4s. and 6s. See List, free. CLIBRAN, Oldfield Nurseries, Altrincham and Manchester.

FORBES' CATALOGUE OF FLORISTS' FLOWERS for 1890—(116 pages). Is the Largest, Best, Most Reliable, and Complete ever issued on Florists' Flowers. It gives accurate descriptions of thousands of varieties of Florists' Flowers, and, in addition, besides a very full List giving Colour, Height, Month of Flowering, and Price of nearly One Thousand Perennials and Hardy Border Plants, with a mass of other valuable information, accessible to all who would excel in the Cultivation of Flowers.

This Catalogue forms a most useful and convenient Reference Book on all sections of Florists' Flowers that should be in the hands of all who love to grow and to apply to them. JOHN FORBES, Nurseryman, Hawick, Scotland.

STERLING VALUE. HARTLAND'S "APRIL QUEEN" HYDRANGEA, sealed Packets, 1s. 6d., for purity, weight, and quality not to be equalled. "A" Year Book of "Rare Seeds" for 1890. A few (partly reserved) Copies are now disposable at 2s. 6d. Free of postage. This volume is in conjunction with my "Illustrated Book of Daffodils." I shall be fitting the Daffodil crop the end of May, particularly "A-Righ" to fill Colonial orders, and shall be happy to meet in retail quantities. My New Book of "The Flower Queen" is now "Sold Out"; plants, 1s. 6d., post free.—WM. BAYLOR HARTLAND, Old Established Seed Warehouse, 24, Patrick Street, Cork.

CLIBRAN'S PRETTY FLOWERS. If you want a unique array of blooms try our Collection of Herbaceous Plants. No botanical weeds, but each plant distinct and beautiful. 12 vars., 3s., 4s., and 6s.; 50 in 3s. vars., 15s. and 21s.; 25 in 12s. vars., 4s. and 4s. The "Fris Queen," Iris odorensis var. gigantea—finest by far of all the Iris family—robust habit, 6 feet high, an immensely lovely white bloom, will grow in any ordinary soil, 2s. each, 18s. per dozen. Ever white and blue, Iris longiana, blue and white, each var., 3s. per doz. See Catalogue. CLIBRAN, Oldfield Nurseries, Altrincham and Manchester.

GRAND NEW COLEUS "DUCHESS OF FIFE." First-class Certificate (Reading Horticultural Society). A fine new and distinct variety. The habit is wonderfully sturdy and compact. The leaves are deeply notched at the edges. The colour is bright scarlet shaded with deep crimson, the edges are narrowly lined with pale green. This is without doubt an excellent variety, and when in flower is sure to become a great favourite. Plants 8s. 6d. each (ready in May). Post and package free for Cash with Order only. Sent out by the raiser, G. PHIPPEN, F.R.H.S., Nurseryman and Florist, Reading.

CLIBRAN'S GEMS OF THE GREENHOUSE and STOVE. Splendid collection of really finest kinds for bloom and foliage. Punctatum, beautiful species of flowers, 6s. each. Easy by Greenhouse, Rhododendron, lovely stone climber, dense clusters of pure white funnel-shaped flowers, 8s. 6d. and 5s. each. Ochna multiflora, beautiful yellow perfume flowers, succeeded by charming fringed flowers, 6s. 6d. each. Easy by Greenhouse, Rhododendron in variety, 3s. 6d. each; 6 vars., 12s. 6d. 6 splendid flowering stone Climbers, 10s. 6d. and 15s. Stephanotis, hardiest and freest flowering variety known, from small plants 6s. 6d. each. Clematis, 12s. and 18s. Boule de Neige, a superb major, one of the best plants for cutting from, 1s. and 2s. 6d. each. Præcox, small for growing on, 6d. each. Camellias, all our own working, making up to 500 pairs of seedlings, in variety, 1s. and 1s. 6d. each; 6 beautiful sorts, 7s. 6d. CLIBRAN, Oldfield Nurseries, Altrincham and Manchester.

New Fern. ADIANTUM CAPILLUS-VENERIS var. GRANITE, T. M.—The late Mr. T. MOORE, in his description of the above, says "It is the finest and most noble of all the varieties of this species of Maidenhair." Strong plants, fit for 18s. now sent out at 12s. per dozen. Repatience from unknown correspondents. Packing free, for order to E. J. VALLERIE, Valleys of the Valley Grower, by special appointment to H.R.H. (the Prince of Wales), Dersingham, King's Lynn, Norfolk.

THE
"PERFECT"
SUMMER SHADING

Supersedes all Others WITHOUT WHICH
NOISE IS GREATLY
FOR SHADING GLASS ROOFS OF ALL KINDS.

Is the Cheapest. Goes four times as far as the old preparations. Note its merits described below.

Messrs. CARLTON, Contractors for the painting of the Glasgow Exhibition of 1888, write:—

"By order of the Directors we applied this Shading to the glass roofing of the Glasgow Exhibition, and found it possessed great advantages over all other preparations we had met with. Being applied cold it was most convenient to use, and while it resisted the action of the rain the whole season it was at any time removed by gentle rubbing after wetting. It afforded a cool and pleasant shade, at the same time admitting an abundance of light."

Price: 1 lb. tin, 1s.; 2 lb. tin, 2s. Post free, 1/2d. extra.
1 b. makes half a gallon for use.

THE
"PERFECT"
WEED KILLER

(Trial sample post free.) WITHOUT WHICH
NOISE IS GREATLY

Maintains its Superiority over all Rivals for permanently destroying vegetation on Walks, Carriage Drives, Ash Tennis Courts, Stone-work grown green, &c. *See List at King Garden, Royal Horticultural Gardens, &c.*

COMPLETE SATISFACTION GUARANTEED
to all using WEED KILLER bearing our Trade Mark, without which none is genuine. *Reserve Imitations.*

MY NEW DAHLIA CATALOGUE

Has been posted to my Patrons; anyone not receiving same should apply at once, when a further Copy shall be sent. It contains—

MY NOVELTIES FOR 1890,

which are quite equal to my previous introductions, many of which are among the most popular of the day. Each section is fully represented, and every good variety will be found fully described. I have a grand collection of—

CACTUS, SINGLE, POMPONE, SHOW, FANCY, and STELLATE VARIETIES.

All are good strong plants, established in pots, and will be ready for planting the 1st week in May. This Catalogue also contains a fine collection of the—

NEW LARGE-FLOWERING CANNAS,

Having flowers almost as large as Gladioli, of almost every shade of colour. This Catalogue also contains an enlarged list of Chrysanthemums, Marguerites, Pentstemons, single Pyrethums, and many other popular groups for present planting. I have issued this season the following Descriptive CATALOGUES—Hardy Perennials, Biennials, Eriogonum Flowers, Tree and Herbaceous Ferns, Japanese and Alpine Primulas, Climbing Plants, Hardy Ferns, Chrysanthemums, Choice Flower Seeds. Any of which can still be had upon application to—

THE APPROACHING ROSE SEASON.

THERE is a wonderful lull always at this time of the year in the Rose world, somewhat like the calmness which precedes a storm, or the night before a battle, when all preparations being made, and everything in order, the combatants of to-morrow lie down to snatch a few hours, or it may be minutes, of sleep, knowing the work that is before them. We have looked over our beds, have noted, and it may be, supplied our losses; have seen what the weather has done, pruned even our Teas, and are now watching the growth that they are making. So far the appearance is favourable, in some places indeed the plants have been hard hit by the frost of March 1, while in others they have escaped, owing to some advantage of position, or peculiarity of treatment.

We have had the usual mournful plaint from the foremost of Rose growers "D. T. P." and also from other correspondents in East Anglia, who tell a very different tale; but I can quite understand that in the same district one garden may have suffered and another got off scot free. I have already noticed how my friend, Mr. Geo. Mount, at Cantbury, suffered from that terrible morning frost of the 14th of March, and yet other gardens within a mile of his were untouched. My Eriogonum were untouched by it, while in gardens not above 3 miles off, they are as if a fire had passed over them. Mr. Frank Cant tells me that his Teas are unharmed, but he adopts the plan which in cold districts may be advantageously followed, of lifting and transplanting the bushes every year; this checks the flow of sap. They do not push so early, and are, consequently, less likely to suffer from the early frosts of May. I do not think such a plan is necessary everywhere, although I would desire to disabuse the minds of people who imagine ours must be a warm county. I am persuaded that it is not true, at any rate, of East Kent; we are so peculiarly subject to east winds, and get very severe frosts and very heavy rain-storms. I imagine that few parts of England could beat or equal it of March 15, below zero in one place, and 29 and 30 of

frost in a good many places. So far, the latter part of April, and the first week of May, have been most favourable; the temperature has been high, and copious rains have pushed the plants into growth. Soon it will be necessary to look out for maggot and greenfly, but as yet they have not made their appearance.

It may not be out of place, therefore, to say a few words to exhibitors—not the old stagers who could most probably teach me many a lesson, and put me up to a dodge or two of which I am in blissful ignorance, for I have never been an exhibitor, and it is too late for me to begin; but seeing a good many shows, as I do, and the efforts, often very feeble, of young exhibitors, a word or two may be of use to them in the coming season.

I. What is the best time for cutting Roses for exhibition? There have been many and different opinions on this subject; how often have I heard it said: "Oh! what an advantage Mr. A. has; the show is so close at home that he put off cutting his Roses until the morning, and then brought them fresh to the show ground." Now, as I have said, I am not an exhibitor, but I have often seen Roses of some of our first-rate exhibitors on the day before the show, which is to be held close to their own doors, and I have found that by far the greater bulk of the flowers were cut the night before, and it was only some buds that had not sufficiently declared themselves the night before that were cut in the morning. Of course if you go out in the early morning before sunrise, or about sunrise, nothing can look more charming than your flowers do then, with the dewdrops glistening on them, and their colours glistening in the soft subdued light of early dawn; but to the Rose exhibitor there is no room for sentiment, and the question is, not how do the Roses look at 3 A.M., but how will they look at 11 A.M., when the judges begin to examine them? I remember once, one most ardent exhibitor losing a much-coveted medal by giving way to sentiment: he went round his garden in the early morning, and there stood before a most lovely bloom of Marie Banmann, the very perfection of a bloom of that most perfect Rose. "Oh! I must have that—is it not a beauty?" "Yea, it is now," I said, "but it will not be in four or five hours' time, and pray do not trust to it." He could not be persuaded out of it, and as a consequence lost his medal. All his other blooms were good; but this, though of course retaining its size and form, had lost its colour. When these flowers are cut with the dew on them, they are apt to be spotty; and there is, moreover, the possibility that you may have a thunderstorm during the night, which will be utterly destructive to all the exhibitor's hopes.

Of course, the exhibitor who is close to the show ground has an advantage in that his flowers are not so kept shut up in the boxes, and have not to endure a long railway journey; but I am convinced he does not enjoy the advantage some people imagine of being able to cut his flowers on the morning of the show day. The best time, I believe, to be before the dew falls the night before; moreover, if cut then and placed in water, they absorb a good deal, and are thus kept fresh.

2. The next question is, at what state of expansion ought the blooms to be when they are cut? This is a point on which I am sure young exhibitors make great mistakes. In most cases they depend upon blooms much too expanded. Like my friend already mentioned, they do not consider what the lovely flower they are looking at has to go through before it passes under the judges' eye, and they have only to cut a bloom and place it in their sitting-room for a few hours to see what a change takes place in these bright-coloured flowers, and they will then see how very careful they ought to be as to the age of the flowers. Of course there is a difference (I am now alluding to the H.P.'s); if a flower is not very full, it will open all the sooner, and those with a good deal of stuff in them will

bear the treatment they have to submit to better. But, as a rule, it is safer never to take a fully expanded flower; a flower three-quarter expanded or half-blown is better—but care must be taken in this matter too, for if the flower is too full, it will not open properly afterwards. It is well to tie a small piece of bast or raffia round the flower, so as to keep it well together; this is almost always done with Teas, which, from their greater substance, hardly require it, and it certainly ought to be done with flowers which are more likely to open.

The 3rd point is, how to treat the flower when cut? It was very much surprised the other day to hear an exhibitor for a good many years (I must own, not a very successful one) that he always put dry moss into his boxes. To some extent, this may account for his want of success. The box in which the Roses are to be placed should be packed freely with wet moss, and the tubes then jammed tightly into it; they should then have some of the wet moss, as green as and as short as possible, placed on the surface. The tubes should then be filled with water, of course (Foster's will be used), the Roses wired and inserted into the tubes, the surface of the moss may be then watered, but not a drop must go on to the flowers; the lid should then be put on the box, and slightly tilted. It should be placed in some cool out-house or coach-house, and the ground thoroughly well watered round it, so as to create a cool atmosphere, and to prevent any dust from rising and settling on the flowers. In the morning the exhibitor will go round his garden, and see if any buds have come forward during the night, and these may be cut and put amongst his "spares," with which every prudent exhibitor should be provided; they are like the reserves which a prudent general always has in store.

But all these preparations will be of no use unless the prospect be good of having good Roses. As far as I can see, Roses have broken remarkably well, and the glorious rains that we have had lately have helped them on greatly, and it is earnestly to be hoped that we may escape those unwelcome frosts which do so much damage. It only shows how very little, however, we can write of other places in our most extraordinary climate. Thus, I read that in Hertfordshire during the month of April there was only 0.77 in. of rain; whereas here, which is not perhaps more than 60 miles in a bee-line, we had 2.95 in., and in one day we had 1.3 in.; so that, if I were to talk with the inhabitants, and tell them what a quantity of rain we had, they would be very much astonished indeed—and I think very often but little allowance is made in these matters, so that we get very conflicting statements. Let us wait, however, and then perhaps in another fortnight or so we may be able to tell better what is in store for us. *Will Rose.*

NEW OR NOTEWORTHY PLANTS.

DENDROBIUM × VENUS, *n. hybr.*

The work of hybridisation proceeds apace. Mr. Norman C. Cookson, of Oakwood, Wylam-on-Tyne, has just flowered a very handsome seedling *Dendrobium*, raised from *D. Falconeri*, crossed with the pollen of *D. nobile*. The raceme is two-flowered, the sepals lanceolate, acute, bright rose above, much paler below, 2½ inches long by ½ inch broad. The petals are much broader, acute, white, with light rose apex. The lip is broad, acute, white, tipped with bright rose, and with a large deep maroon blotch. Thus the flowers have much of the general appearance of *D. Falconeri*, except that the yellow is absent from the lip. They are large and very showy, and as the plant has now only flowered for the first time, it should develop into a good thing. The leaf-stem is narrowly lanceolate-linear, 3¼ inches long by ½ inch broad. Mr. Cookson remarks that the pseudobulbs are almost intermediate between the parents, being semi-pendulous, and the nodes not nearly so much swollen as in *D. Falconeri*, with which it also agrees in its habit of producing new pseudobulbs from the summits of the old ones. It is also said to be a robust grower. The most obvious character derived

from *D. nobile* is the absence of the yellow disc of the lip. *R. A. Rolfe, Herbarium, Kew.*

CYPRIPEDIUM × NUMA, *n. hybr.*

This is a new hybrid, raised by Mr. Seden for Messrs. Veitch, between *Cypridium Lawrenceanum* and *C. Stonei*, the latter being the pollen-parent. It was exhibited at a meeting of the Royal Horticultural Society on March 11 last, when it was awarded a First-class Certificate by the Orchid Committee (*vide p.* 336). A note sent with the flower points out that the "leaves are longer and narrower than in *C. Lawrenceanum*, and tessellated in the same way but less brightly; that is, well-nigh intermediate between the two parents." The flower has the general aspect of *C. Stonei*, but the dorsal sepal is less abruptly acuminate, and bears eleven irregular stripes of purple brown, the petals are not twisted and more spreading, the lip almost uniformly light purple-brown, not distinctly reticulated, while the staminate is nearly orbicular, very concave, closely hairy, a little paler than the lip; three-toothed above, the central tooth minute, the outer ones much larger, and curved almost till they meet, so as to enclose a nearly circular open space. *C. Stonei* has been crossed with two other species, in each case it having been used as the seed-parent: first with *C. barbatum*, giving rise to *C. × eurandrum*, and afterwards with *C. superbiens*, when *C. × Morgania*, the *facile princeps* of hybrid *Cypridiums*, was produced. In each case the credit is due to the indefatigable Mr. Seden. *R. A. Rolfe.*

PRUNUS PSEUDO-CERASUS.

In fig. 99 we reproduce the single form of the above plant, one of the showiest of flowering Japanese trees. Originally named by Lindley, a double form of it is figured in the *Revue Horticole*, 1895, p. 371, as *Cerasus Sieboldii* Carrieri, but the older name will now have precedence.

This double form of *Prunus pseudo-cerasus* is known also in gardens as *Cerasus Wateri*. The flowers are possessed of several rows of petals, making it a pleasing full flower, but there are some other varieties which differ considerably in size and somewhat in colour. The form known as *C. Wateri*, flowers of which were recently shown to us by Mr. T. Baines, measured nearly 2 inches in diameter, white, each petal prettily marked with bright rose. Mr. Baines asserts that this particular plant blooms a fortnight earlier than *C. Sieboldii*, and that too in a position not fully exposed to the sun.

The double forms of *Prunus pseudo-cerasus* if planted in fairly good soil, on banks and on rising ground, or as solitary plants on the lawn, are very decorative when in flower. The single flowered type form bears numerous reddish sour fruits on long stalks.

GARDEN EDGINGS.

Nothing adds more to the appearance of a garden, be it large or small, than well-kept edges, which are almost the first objects that come under the eye. The plant most generally employed for edgings to walks is *Box*, which, if in good trim, looks neat; but the worst of live edgings is, that they do not admit of weed-destroyers being used, and that is against them, as gravel, even if it be of the best binding nature, will get foul to a greater or less extent, and then it involves much time and labour to clean it. This being so, it is better in many cases to have a dead edging of some kind, but it should be of a very hard, indestructible material—one of the nearest I have seen being a tile with a cable-patterned top, and it is one which does very well for kitchen gardens. If the appearance of a long line of these tiles, or anything else that may be used, is objected to, they may easily be hidden, and the sides of the walks made very beautiful by planting *Gentiana acutis*, Thrift, double Daisies, or other suitable plants, of which there are many; and, if a more utilitarian spirit prevails, thin rows of Strawberries, Parsley, or such-like, may be grown. In some places flints, and in others, large

pebble stones are readily obtainable, and either of them answer admirably for laying at the sides of walks as a boundary, and to support or keep back the soil, and both serve well for the purpose of nurses to the flowering plants named, as each likes them to nestle to and send their roots under. The Gentian especially is benefited by the flints or pebbles,

ceorum, Alyssum saxatile, Pinks, Sedums, Aubrietias, or any other low-growing, trailing subjects, as positions of that kind are just the home for them, and they form a splendid foreground for plants used behind without being stiff and formal as any other edging would be. In cases where borders are flat, a grass verge in front looks well, but

an annual trimming and the frequent use of the shears.

Box, where it succeeds and keeps its colour, makes a very satisfactory edging to walks, but it should never be allowed to get thick and high, as when in that state it not only looks heavy, but forms a harbour for slugs and other insects, which sally

FIG. 591.—PRUNUS CERASUS PSEUDO-CERASUS. WHITE FLESHED WITH ROSE. (SEE P. 608.)

and when planted between will soon hug them closely, and do all the better for the moisture they conserve, which the plants find at the sides. Flower borders may be raised, or can be placed in that desirable form, and much beautified by placing any rugged waste pieces of stone, burrs, or clinkers along the edge and partly burying them, and then planting between such plants as the lovely deep blue Lithospermum prostratum, the Rock Rose, Daphne

it should be of good width, and in that respect proportionate, or its appearance will be meagre and out of accord with the ground that it bounds. Grass verges not only look well, but they are very easily kept, as a mowing machine run over them weekly during the summer will maintain them in excellent order—that is, so far as their surface is concerned; but, in addition to that, it is important to have the edges sharp and well defined, which may be done by

forth at night and do irreparable harm. There are two ways of reducing such bulky Box edgings when they have become too large, the one by heading back and cutting in the sides, and the other by entire relaying. The present is a good time for carrying out either of these operations; but to give the Box a fair chance to break again or make root, there is now no time to lose. The heading back and cutting in may quickly be done by the use of a pair

of sharp shears; but in a general way it is better to dig up and relay and in doing this the Box should be shortened as much below as it will bear without taking off too much of the roots. With the Box so reduced, it may then be pulled apart and packed closely, when it will be ready for putting in again; but to carry this part out well, a good workman is needed to get the roots regular. The way to have them regular is to start in first of all to prevent the roots from growing and having it perfectly level at the top, and then to dig out, in a regular, repeating motion with the back of a spade, which done it only remains to strain a line, and cut out a trench beside it, and then lay the Box in. As soon as this is done, the soil should be closely pressed against it, and so finished off, when the gravel may be returned, and the job made complete.

With regard to clipping or trimming Box, the best time to do that is just after it makes its first growth, or say the beginning of May—in that season we always do ours, and it makes just growth enough afterwards to take off the shorn appearance, and look well. By pursuing this course annually, just before bedding out, we are able to keep our edgings close, and though some have stood for over twenty years, they are only 3 inches high, and less than that through. Any gaps that occur are made up by dibbling fresh Box in the lines, or rather by using a wedge-shaped tool to make a hole in which to plant it, refilling with soil. *J. S.*

THE FIXING OF FREE NITROGEN BY PLANTS.

(Continued from p. 589.)

In regard to the yellow Lupins, with which the most striking results were obtained, it may be stated that, under the influence of the soil-extract seeding, the above-ground growth was not only very luxuriant, but the plants developed great maturing tendency, flowering and seeding freely. The development of the roots generally, and that of swellings or nodules on them, were also very marked. In pot 4, with the Lupin-sand itself, which would supply a not inmaterial amount of combined nitrogen, although the growth was normal, it was, both above-ground and within the soil, very much less than in the pots with soil-extract only; and the development of nodules was also less. It is possible that the less development in the Lupin-sand itself, than in the quartz-sand with soil-extract only, was partly due to the much less porosity of the Lupin-sol, especially when watered. The blue Lupins failed; the Cloves and Lucerne experiments are still in progress.

Referring to the main object of the investigation, it will be admitted that the results, so far brought forward, are abundantly confirmatory of those obtained by Hellriegel, and that the fact of the fixation of free nitrogen in the growth of Leguminosæ, under the influence of microbe seeding of the soil, and of the resulting nodule formation on the roots, may be considered as fully established.

It appears that, almost concurrently with the experiments made at Richmond, M. Béd. of the Physiological Laboratory of the Musée d'Histoire Naturelle, of Paris, has made various experiments on lines suggested by the results of Hellriegel and Wiggatz.

He examined the contents of nodules from Lucerne roots, and observed rounded grains and bacterian-like filaments. He determined the nitrogen in the root-tubercles from various Epilobaceæ, and found it much higher in them than in the stalks, leaves, or roots. He germinated Peas in a nutritive solution, and added some of the matter from a crushed Lucerne root-tubercle. The Pea roots became covered with tubercles, and eventually the nitrogen in the plant was about double that in the seed sown.

In another experiment he germinated two Lupin seeds, inoculated one of them from a living Lucerne root-tubercle, and planted both in gravel with a nutritive solution free from nitrogen.

Eventually the roots of the inoculated plant were

covered with tubercles, whilst those of the other had none. The inoculated plant also contained about two-and-a-half times as much nitrogen as the seed, whilst without inoculation there was practically no gain. In another experiment, Peas were germinated in a Lucerne-soil transplanted into gravel, and nutritive solution free from nitrogen added, when the roots became covered with tubercles, and the nitrogen assimilated was nearly twenty-five fold that of the seed. On inoculating the germinated roots of Helicis and planting them in sand, they grew vigorously, formed pods, developed many tubercles on their roots, and assimilated nearly fifteen times as much nitrogen as the seed supplied. Lastly, he planted a fragment of Lucerne root with nodules on it, in a sandy soil, reserving a similar fragment for analysis. Several cuttings of Lucerne were obtained; and when taken up the root had many nodules, and the nitrogen assimilated was more than eighty times as much as in the cutting planted.

As to the importance to agriculture, in a quantitative sense, of this newly established source of nitrogen to the Leguminosæ, the evidence at present at command is insufficient, say the authors, to enable them to form any very decided opinion. Both agricultural investigation and direct vegetation experiment have clearly shown that Leguminosæ do take up much soil-nitrogen, and, at any rate in great part as nitrate. But in some special cases, there was no evidence to justify the conclusion that the whole of the nitrogen had been so derived; and it was admitted that some other explanation of the large amounts of nitrogen assimilated was needed. It is not improbable that, in those cases, the agency now under consideration contributed to the result. *J. J. Willis, Horpenden.*

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT CLARE LAWN, EAST SHEEN.

On the twenty-six glass-houses devoted to fruit and flowers in F. Wigan, Esq.'s garden at Richmond, none are set apart for the Orchids, which are in the care of Mr. W. H. Young, who was formerly employed at Kew. Among them at the present time are two specially attractive houses, and in which a varying display is kept up. The first, a rockery planted with Ferns and Palms, has a fine display of Cattleyas arranged among the overhanging foliage, many very fine Cattleya Mossie being employed, as well as the varieties of C. Mendelii, C. Schroderæ, C. Lawrenceana, and one or two of the latest flowering of the C. Trianae. With these appear the fine sprays of that handsome old species, *Oncidium sphaclatatum*, some good *Odontoglossum crispum*, and *O. nebulosum*; several specimens of *Cypripedium Lawrenceanum*, a finely flowered C. Swainianum ×, with large flowers; some *Lycaste Skinnerii*, and *L. cruenta*, a large many-flowered specimen of *Bifrenaria Harrisoniæ*, the curious *Masdevallia ephippium*, *Vanda tricolor*, *Dendrobium Jamesianum*, *D. thysiflorum*, and other species, the drooping sprays of *Odontoglossum citrosium*, the clear yellow *Cattleya citrina*, and the elegant old *Dendrobium Picardii* hanging overhead, the whole forming an example of effective arrangement.

In the *Phalenopsis*-house, the other show-house referred to, was a good display of blooms on a really healthy and thriving collection of these handsome Orchids, which so many fail to grow successfully. A plain gravel-walk, and unpaired basement, which some believe to be essential to these plants, are to be found in the house; and on the side and end are ornamental rockeries of Tuft planted with *Fittouias*, *Tradescantias*, and plants of similar nature (the *Phalenopsis* being suspended overhead), carrying out the idea, advanced by many, that the presence of other healthy vegetation is advantageous to the *Phalenopsis*. Be that as it may, it is certain that the Clare Lawn *Phalenopsis* succeed beyond some others that we have seen. Some magnificent forms of *Phalenopsis Luddequianum*, *P. Sandriana*,

and *P. grandiflora*, were in bloom, and *P. leucorrhoda* and *P. Cynthia* were in bud. Other handsomely-flowered plants in this house were *Thrixspermum Berkleyi*, *Saccolabium curvifolium*, *S. ampullaceum*, *Angreum Sandersonianum*; and in bud was a splendid example of *A. Ellisii* with about a dozen leaves. In the same house was a collection of *Cypripedium*, many of them in flower.

The Cattleya-house, recently overhauled and rearranged, had a good show of the varieties of *Cattleya Mendelii*, a plant or two of C. Skinnerii, *Lælia majalis* in bud in several plants, one with six flowers; C. Schilleriana, *Platylis filiformis*, with about fifty spikes coming on; *Lælia monophylla*, a small and lovely gem, which possesses five spikes of its bright scarlet flowers yet to open; many *Odontoglossum citrosium* that are fully open, and other species of the intermediate-house. In the collection of *Cypripedium* were in bloom good specimens of *C. bellatulum*, C. Godefroyæ, and others of that group; also C. Druryi, C. levigatum, C. hirsutissimum; some grand C. ciliolare; C. Curtisii, C. superbiens, C. Dominicanum ×, C. cochiflorum ×, and several varieties of C. longifolium. In bloom or bud in other houses were plants of *Cymbidium Lowianum*, *Diacrium bicorantum*, *Vanda teres* with ten spikes, some good *Miltonia vexillaria*, *Trichopilia suavis*, *Masdevallias*, and other cool-house Orchids.

The collection of Orchids now under Mr. Young's care will doubtless show farther improvement as time goes on.

ODONTOGLOSSUM × WILCKEANUM, Rehb. f.

The hybrids between *Odontoglossum luteo-purpureum* and *O. crispum*, known in gardens under the above name, are becoming rather numerous, and it is interesting to observe the variation in colour they present. In some, as in the original form, the colour of *O. luteo-purpureum* preponderates, while in others, as in *Wilckeanum pallens*, the balance is in favour of the other parent. They are all, however, tolerably intermediate in form, and for this reason are easily recognised. A fine raceme just received from E. Harvey, Esq., of Aigburth, near Liverpool, for determination, is almost exactly the form figured in Warner's *Select Orchidaceous Plants*, ser. iii., t. 23, and very well represents the original form. The plant which was certificated by the Royal Horticultural Society, on April 8, 1884, as *Odontoglossum Shuttleworthii*, now in the possession of Erastus Corning, Esq., of Albany, U.S.A., and from whom flowers have recently been received at Kew for preservation, is also a natural hybrid between the same two species, and very closely approaches *O. Wilckeanum pallens*, as well figured in the *Orchid Album*, t. 201. *O. Wilckeanum sulphureum* is, perhaps, about intermediate in colour. All the forms are very handsome garden plants. *R. A. Rolfe.*

CYPRIPEDIUM LEMOINERANUM ×.

A cross of uncertain origin, but it belongs to the Svedeni group. It was raised by M. R. Lemoinei, of Lille, and obtained the prize at the Ghent Quinquennial for a new seedling. Mr. Sander grows these hybrids in rich loam and peat, gives abundance of water in the growing season, and a smaller quantity during the winter. The stages should always be kept moist. Temperature 60° to 65° in winter, rising 10° in summer. *Reichenbachii*, t. 80.

CATASPEUM TILLOTUM.

According to an article in *Reichenbachii*, accompanying t. 90, this magnificent plant is the same as that subsequently described by Mr. N. E. Brown as *C. Bungeorothi*. They require, says Mr. Sander, to be grown in a warm moist house in a compost of fibrous peat and chopped sphagnum. Baskets are most suitable, which should be hung near the glass, shading from the direct rays of the sun. Water sparingly at first, gradually increasing the quantity as the growths develop, and again diminish the quantity as the flowers appear. Temperature in winter, 55°, with a rest of two to three months, in which no water at all should be given.

DECORATIVE WILD FLOWERS OF MALTA.

MALTA is noted for its numerous flowers, many of which are brought in large quantities into Valletta in their various periods of blossoming, for decorative purposes. The following are the most important from the point of view now considered:—

Coranthus mollis and spinosus.—This occurs in many of the rocky valleys. The form of the leaf is familiar to the reader as it is carved on the Corinthian capitals. It is often grown in wild parts of gardens, where its handsome leaves are very effective.

Alveta capitata.—This is the only Fern which is really common in caves and elsewhere in Malta. The usual method of cultivating it is on the outside of globular earthen pitchers, which have two handles, the form being taken from the ancient Roman vessels. Clay is put on the outside, and the Fern roots bound upon it; the plant readily establishes itself. The jar is kept full of water, which percolates through the jar, and so keeps the clay moist. The vessels are called "bombis." They are generally suspended. (See p. 461, April 12, 1890.)

Alveta autumnalis.—Many fields are sometimes almost scarlet in places where this plant grows; great quantities are sold in the streets. There is a variety called *citrina*, which has generally three yellow petals. It is a degraded form, and appears to be a reversion. Orange-coloured flowers are occasionally met with.

Amphibolus conicus.—The Bitter and Sweet Almonds are much grown, and bear profusely. Though not truly wild in Malta, the flowers, pink and white, are often cut for decorative purposes.

Anemone coronaria.—The purple flowers of this species are dotted about the fields in many places. A large bunch can soon be collected by jumping over the wall of a field, which have no gates, only loose stones piled up where the gate ought to be. There is no variation in the wild species, but it gives rise to many different colours under cultivation. It is grown in several gardens.

Antirrhinum majus and scabrus.—These two species are plentiful in certain places; the former abounds on the walls and rocks round the Orange groves of Boschetto, on the south side of the island. It is the ordinary purple form of our English gardens. *A. scabrus* has a rather smaller flower, nearly white, with a little yellow and purple about it. It is common in the forts of Valletta, and in some of the valleys.

Arundo donax.—This handsome bamboo-like grass is indigenous, but also cultivated. The inflorescence is often cut for halls and passages, and is employed in union with Pampas-grass. The split stems are used for making market baskets.

Asphodelus ramosus.—This is very abundant all over the island wherever rocks are exposed, and so prevent cultivation. The stems grow to 3 or 4 feet high, and have much-branched panicles of star-like white flowers, each petal being streaked down the middle.

Aurantia.—Oranges, Lemons, and their kind being a staple commodity, the profusion of Orange blossoms at certain seasons, one need hardly say, does not fail to supply some for decorative purposes.

Calceola maritima and falcata.—The commonest species of this genus is *C. arvensis*, which grows profusely by roadsides, but the flowers are not larger than that of a Daisy; those of the two mentioned are much larger, but, as they are not so common, they are not much used.

C. officinalis is more generally grown, and mostly has a somewhat deeper orange tint than in England.

Cerastium silvaceum.—The Carob, or St. John's bread, is the only tree of any abundance in Malta; being much exposed, the trees grow low and assume a scrubby form. The leaves are used for strewing the floors of churches at the time of Festas.

Chrysanthemum coronaria.—This is most abundant about the ditches of the forts of Valletta and elsewhere. In some inaccessible enclosures it forms

a perfect sheet of yellow, and is much gathered for sale. There is a variety with about half the corolla white, going a pale rose on the circumference.

Crotus Anagallis.—Several trees of small size occur in the valleys, the foliage is tomentose, but the bunches of flowers are very like our "May;" the fruit is very large, and eaten by the peasants. Being rare, it is seldom seen. I have gathered it in quantities from one valley.

Diplazis crocoides.—This white crucifer is one of the most abundant of plants, the slopes outside the forts being a sheet of white in December. It is also very abundant in the fields. Bunches are occasionally brought for decorative purposes in the winter.

Eriobotrya cerasifera.—This is the only Hawth in Malta, and is abundant in the rocky parts. It varies in tint from pale pink to cerise. Men and boys collect it in sacs, and bring it to Valletta, where it is sold in the streets.

Folia coccinea.—This herb has bright crimson flowers; it occurs in waste places, barren rocky ground, and in fields. It is collected and sold.

Ferula cavanillesii.—This plant is common, and bears large decomposed leaves like Fennel (which also grows wild in many places), though the ultimate divisions are not so fine; the foliage is used for decorating the "cavaletti" or "cabs," during the carnival.

Glebithus sp..—This species is very abundant as a "corn-field weed."

G. cavanillesii is also in the island, but is less common. Large quantities are sold.

Helianthus scaber.—This is called "Salla," or Maltese Clover, and is cultivated for making "hay;" when in full flower little else than a crimson sheet is seen in the fields.

Hypochaeris glabra.—This is very abundant in fields, the terminal barren blue corymb—the origin of the feathery process in the cultivated form—is not infrequently with the dark purple bells below.

Isis garrula.—Though not usually recognised as a wild flower of Malta, I found it far away from the haunts of man in a deep rocky valley. In Mr. Harry's garden it changes from purple to white, and much resembles *I. florentina*.

Matthiola incana.—The Brompton Stock is abundant in the rocks, fortifications and elsewhere near the sea. It is usually purple, but a variegated variety, striped with purple and white, grows on the rocks of the fort just outside Valletta. Both kinds as well as white and the double forms, are cultivated for sale.

Necessus Taurina.—This is extremely abundant on all rocky ground. Great quantities are collected by boys, and brought to the florists in Valletta. The usual form has a thick short stem and numerous flowers; another form has slender and longer stems and fewer flowers.

Nigella damascena.—Our old-fashioned garden flower, "Love in a Mist," here grown wild in the fields.

Ophrys and Orchis.—There are four or five common species of each of these genera. I have personally gathered many bunches of *Ophrys fuscata* and *O. bombyliflora*, as well as *Orchis sacra*, *O. tridentata*, *O. pyramidalis*, and *O. undulatiflora*. They are not collected, however, for sale.

Orchis cernua.—This so-called "English weed," introduced from the Cape of Good Hope by Prof. Giacinto in 1811 for the botanic garden, has become the greatest pest in Malta, though its golden-yellow flowers brighten up every field, wayside, tops of walls, crannies, &c., where it vies with the ubiquitous Pellitory. It is disappointing, for though a nosegay looks well for half-an-hour, the petals then roll themselves up, and they never open again.

Pancratium maritimum.—This handsome plant produces long leaves, sometimes nearly a yard in length, and broad in proportion, and is grown in large pots in passages, halls, &c., for decoration.

Phlox frutescens.—This shrub, with whorls of orange-coloured flowers, would doubtless be more sought for if it were commoner. It only grows

abundantly in one valley. It is called "Jerusalem Sage."

Phoenix dactylifera.—The Date will not ripen in Malta, so that it is not cultivated. Here and there one sees a tall, solitary tree, a relic of a bygone time. Only the foliage is sometimes used at festas.

Rosa alba.—This Mignonette is most abundant in Malta, and is often gathered with the *Alveta*. It has a slight perfume, the corolla being white, and larger than in *R. odorata*, making the flowers more conspicuous.
